Because inner speech is internalized social speech, two key conditions seem necessary for this development: (a) intense exposure to and participation in an L2 community of speakers and (b) major internalization of the L2. A strong positive correlation between advanced proficiency in the other language and use of the L2 in inner speech was evidenced in Guerrero's (1994, 1999) and Gutiérrez's (2000) survey studies involving college level L2 and foreign-language (FL) learners. Similarly, the presence of the L2 in inner speech processes has been documented among speakers who have attained high levels of L2 mastery, such as immigrants who have acquired a new linguistic identity and modified their conceptual and semantic foundations on the basis of the L2 (Pavlenko & Lantolf, 2000; Larsen, Schrauf, Fromholt, & Rubin, 2002). The possibility thus arises that in cases of very advanced proficiency and intense exposure to another language, this might become an alternative linguistic resource—no doubt with strong ties to the L1—to mediate inner speech activity.

Reports indicate that low proficiency L2 learners do experience covert speech behavior in the L2, but this does not mean they have yet developed the capacity to mediate their thinking through L2 inner speech. At early stages of L2 acquisition, it has been found that learners make subvocal use of the L2 mainly for rehearsal or playful purposes. In a study involving learner diaries, Guerrero (2004) was able to detect some of the intramental processes that low proficiency ESL college learners characteristically undergo both inside and outside the classroom, namely, silent repetition and imitation of L2 models, trying to understand language heard or read, mentally experimenting with and reflecting on L2 forms and meanings, and planning what or how to say something in the L2. Guerrero hypothesized that these are essential processes in the internalization of the L2, a key requirement for its eventual development as a tool for thought.

Sustained ability to think verbally through the L2 comes with greater proficiency; however, this capacity is usually not developed uniformly across all cognitive domains or for all communicative purposes, even in cases of L2 ultimate attainment. L2 inner speech may be effective or operative for certain cognitive functions and not for others. A study by Cook (1998), which surveyed internal and external uses of the L2 among proficient speakers of more than one language, revealed great variety in the extent to which they used the L2 for self-communicative purposes. For example, there was an overall preference

for use of the L1 for verbal cognitive tasks such as counting things or adding up, equal use of the L1 or L2 for remembering phone numbers, and a bias for the L2 for keeping a personal diary. The results, however, showed great variation among the participants not only according to the task but also to their L1 background and knowledge of other languages.

In another recent survey (Dewaele, 2009), the researcher asked a large-sized group of multilinguals ($N = 1,579$) which language they preferred to use for mental calculations, such as arithmetic, and for inner speech (as in the question "If you form sentences silently, what language do you typically use?" [p. 255]). Frequent or constant use of the L2 was reported specifically for mental calculations by a third of the participants and by more than half of the respondents for inner speech. The participants tended to use less their third (L3) and fourth languages for these cognitive functions. The study also found a significant effect of age of acquisition on frequency of inner speech in the L2 and the L3, with higher rates of use among early acquirers (people who had started learning their additional languages at ages 3–7) than among late acquirers.

The type of inner speech a person activates is highly related to contextual demands. Verbal tasks, such as listening, speaking, reading, and writing, for instance, necessarily call for inner speech mediation. Among L2 users, bilinguals, and multilinguals, these tasks involve more than one language at the person's disposal in inner speech. Studies reviewed in Guerrero (2005) show that use of the L1 as a meaning-making tool and sometimes as translation mechanism in inner speech activity decreases with greater L2 mastery but increases with task difficulty. The use of L2 inner speech that occurs in the act of reading FL texts, for example, was investigated in a series of experiments reported by Sokolov (1972). In this research, when the FL texts had been simplified and learner proficiency was high, comprehension proceeded swiftly as a process of selecting meaningful units, focusing on key words, and making generalizations without translation. Difficult passages and low proficiency, on the other hand, resulted in greater unfolded inner articulation of the written text and efforts at translation (pp. 147–54). Sokolov's experiments highlight the essential role that inner speech, in the form of concealed verbalizations while listening or reading, has in understanding and retention of L2 material.

The capacity to engage in L2 inner speech that occurs as a result of major internalization of the L2 seems to be accompanied by substantial changes in word meanings and conceptual structures. Research suggests that advanced L2 or FL learners, bilinguals, and multilinguals restructure their L1 conceptual and semantic foundations on the basis of new lexicalized and grammaticized meanings offered by additional learned languages (Pavlenko, 2005). Whereas researchers speculate on whether such conceptual and semantic bases respond to multiple conceptual stores (one language—one store) or to a common underlying system of meanings (see discussions in John-Steiner, 1985; Kecskes & Papp, 2000; Pavlenko, 2005), the fact remains that for multicompetent individuals inner speech activity involves a complex and dynamic process of activating two or more ways of understanding and representing the world. For these individuals, inner speech implies constructing meaning through the multiple senses of words acquired in more than one language.

When extensive reconceptualization through a new language occurs, profound changes in personal identity may also take place. Because inner speech is vital not only for establishing discursive relations with the outside world but also with oneself, the appropriation of a new meaning-making system frequently results in a new, bi-/multilingually mediated person (for accounts of self-reconstruction in the autobiographical narratives of advanced bilinguals, see Pavlenko, 1998; Pavlenko & Lantolf, 2000). The long, complex, and often painful process of translating oneself into another language as a result of conceptual changes in inner speech has been poignantly described by Eva Hoffman, a Polish-born writer who became highly proficient in English as an immigrant in Canada and the US. In her words,

4 INNER SPEECH IN SECOND LANGUAGE ACQUISITION

When I talk to myself now, I talk in English. English is the language in which I've become an adult, in which I've seen my favorite movies and read my favorite novels . . . In Polish, whole provinces of adult experience are missing. I don't know Polish words for "micro-chips," or "pathetic fallacy" . . . If I tried talking to myself in my native tongue, it would be a stumbling conversation indeed, interlaced with English expressions. (Hoffman, 1989, p. 272)

Finally, an SLA perspective on inner speech naturally leads to pedagogical considerations. Whereas development of L2 inner speech can occur in naturalistic settings and in the absence of formal L2 instruction, educators can do much to foster in learners the ability to think through a new language. Two points will be mentioned in this respect. First, it is important to note that the development of L2 inner speech is not a prerequisite but an outcome of social interaction in the L2. Without significant participation in meaningful classroom activities conducted in the L2, there cannot be sufficient internalization and conceptual restructuring to enable effective thinking through the L2. Second, it seems desirable to raise the topic of inner speech to metalinguistic awareness so that learners can gain control over it and intentionally deploy it for their benefit.

Innovation in Language Teaching and Learning

DAVID CARLESS

The study of innovation in language education began to generate particular interest only from the 1980s onwards, with important early contributions including Kennedy (1988) from a UK perspective and Henrichsen (1989) from a US one. The former was significant in establishing the management of educational change as an emerging subdiscipline of applied linguistics. Before that time, the complexities and challenges of introducing educational change were often underestimated or insufficiently problematized. In recent decades, interest in the topic of innovation has grown substantially, particularly in general education in the work of scholars such as Michael Fullan (e.g., Fullan, 2001) and Andy Hargreaves (e.g., Hargreaves, 2003), and also in language education, as evidenced by recent books: Murray (2008), Alderson (2009), and Wedell (2009).

For the purposes of this entry, I define innovation as an attempt to bring about educational improvement by doing something which is perceived by implementers as new or different. I use it interchangeably with the term “change.” Examples of innovation in language education over the past few decades include new pedagogic approaches, such as task-based language teaching; changes to teaching materials; technological developments, such as computer-assisted language learning; and alternative assessment methods, such as the use of portfolios. A further major strand of innovation concerns the expansion of language education in various EFL contexts; for example, English in the school sector starting increasingly early at elementary school level.

The management of innovation is a critically important field because the development of education rests in its hands. The litany of failures of educational reforms indicates that an enhanced understanding and implementation of the principles and practice of the management of educational change would make a major contribution to the discipline. The wider field of applied linguistics needs to pay greater heed to the insights that innovation theory and practice can contribute (Waters, 2009).

The main rationales for change are indicative of the centrality and ubiquity of innovations. Governments, school managers, teachers, or all of these want to make education more effective for students. Innovations may help schools to keep up-to-date with the latest developments or research findings, and can also be a force to encourage educational equity and fairer opportunities for diverse sections of society. Educational change may also contribute to the development of economic competitiveness. There are less idealistic reasons for innovation too. Governments and policy makers sometimes want to create a facade of being up-to-date or to create an aura of activity. Changes may also be made so as to strengthen accountability systems or for short-term political advantage (Wedell, 2009). In the globalized world, governments also sometimes feel encouraged or impelled to indulge in policy borrowing, the adoption of innovations which other industrialized countries have been implementing.

Innovation is extremely difficult to engineer successfully, and the classic work by Rogers (2003) outlines five oft-cited factors which influence end users' responses: relative advantage, compatibility, complexity, trialability, and observability. Reforms which are perceived

by individuals as having greater relative advantage, compatibility, trialability, and observability and less complexity are likely to be adopted more rapidly and efficiently than other innovations. Much of the applied linguistics literature documents failed (or relatively unsuccessful) attempts at innovation. While on the one hand this is probably a realistic appraisal, it is not always clear precisely how success or failure is judged or perceived. Most reforms have positive, negative, and unanticipated impacts. Innovations which do not achieve all their (overambitious?) objectives should not necessarily be classified as failures. The success of innovations should be gauged by the extent to which students are making more learning progress than before the innovation was implemented (Van den Branden, 2009).

The main barriers facing innovation can be broadly grouped into three categories:

- *Teacher-related*: lack of teacher ownership or understanding of the innovation; change not congruent with existing teacher values and beliefs; negative attitudes, often engendered by the additional workload entailed; teachers are often emotionally bound up in existing practices; and change can be personally threatening.
- *System-related*: poor communication and lack of mutual trust between change agents and frontline implementers; putting too much emphasis on the intricacies of the innovation itself and not enough on consideration of how it could be implemented; lack of appropriate resources to support the innovation; insufficient professional development and support for teachers; failure to bridge the gap between rhetoric and reality; cynicism engendered by previous failed attempts at innovation; failure to align a pedagogic innovation with the requirements of high-stakes examinations.
- *School-related*: lack of supportive culture for change; conservative forces within a school; lack of support or understanding from senior management; inadequate school-based resources; student difficulties in adapting to teacher change, particularly if the rationale has not been persuasively articulated.

Markee (1997) makes the useful distinction between primary innovations (changes to teaching materials or pedagogy) and secondary innovations (organizational changes which provide enabling support for the primary innovation). One of the reasons for lack of success in implementing change is failure to promote secondary innovations.

While much of the above applies to most educational changes regardless of the specific discipline, particular issues in language education are contextual and cross-cultural considerations. Reforms in language education, for example, often involve exporting innovations originating in the Anglophone world to developing countries in which English is a second or foreign language. It is sometimes the case that pedagogic values, such as learner-centered, communicative, or process-oriented approaches, clash with different, though equally valid, philosophies which may put greater emphasis on whole-class direct instruction, examination preparation, or more product-oriented teaching. A classic work exploring some of these dilemmas, using data from Egyptian classrooms, is Adrian Holliday's (1994) book. More recently, Wedell (2009) has argued that we need to put people and contexts at the core of the innovation process, and similarly Carless (2011) puts forward the case for "contextually grounded approaches" to pedagogic innovation. A key theme in all three of these works is that innovations need to be designed in ways which are receptive to and respectful of both local classroom realities and wider national cultures.

In view of the multiple challenges facing the implementation of innovations, it is worth considering under what circumstances there are prospects for success. The following conditions act as facilitating factors:

- The innovation is not overly ambitious and has support from sufficient relevant secondary innovations.
- It has appropriate time frames and seeks to facilitate early, small-scale success which generates momentum and positive sentiments.
- Teachers are brought on board at an early stage, and feel belonging and ownership that is of more than a token nature. These teachers may act as brokers, “champions,” or opinion leaders.
- Effective institutional-based professional development and support are built into the project.
- The innovation is contextually and culturally appropriate, and does not promote values which are incongruent with those of implementers.
- Problem-solving strategies are built into the project and there are change-management strategies to tackle challenges arising.

Conditions such as the above are probably rarely present in the complex arena of educational change. Following from this, a potential way forward for innovation in applied linguistics would be the dissemination of more exemplars of good practice. We have learned much from past failures and may learn even more from further stories of success. A valuable contribution comes from documented accounts of successful medium- or large-scale innovations in the school sector. A useful example is a discussion of the implementation of task-based teaching of Dutch as a second language (Van den Branden, 2006) in schools in Flanders. In this case, strategies to promote the innovation included teacher education which itself incorporated experiential task-based principles and coaching based in the classrooms of teacher participants. The latter is especially valuable in view of its emphasis on supporting classroom implementation of the innovation.

By way of conclusion, I briefly suggest some avenues of further research and ways forward for innovation in applied linguistics. There is a need for more longitudinal studies of innovation, and particularly useful would be studies of the sustainability of innovations or how they are modified over time. Retrospective analyses could also be valuable, such as studies which review how an innovation moves through stages of adoption, implementation, and then abandonment, renewal, or institutionalization. Finally, more contributions on the management of innovation in language education from scholars outside the main Anglophone countries would be particularly welcome (Waters, 2009).

Input Processing in Second Language Acquisition

SUSANNE E. CARROLL

Language acquisition requires analysis of speech and text used around us. This entails that we *process input*, that is, we perceive, classify, and understand verbal stimuli. A model of language processing is shown in (1).

The term *input* refers to linguistic stimuli (oral, written, gestural) that occur in a physical environment (for example, in a conversation, or in reading a text such as this one). Stimuli are perceived and processed by dedicated units of mind called *processors*. In the case of a conversation, input is moving air (or visual stimuli relevant for signed language and gesture, or both); outputs are parsed syllables, recognized words, analyzed sentences, and meanings. These are linguistic outputs. Other information, such as speaker identity and the fact he has a cold, may also emerge (paralinguistic outputs). Processors analyze such inputs and create such outputs by drawing on universal properties of language (*universal grammar*), previously acquired knowledge of the language in question, knowledge transferred from another language, and knowledge of the world (encyclopedic knowledge).

A model of language acquisition is shown in (2).

Here *outputs* are acquired knowledge, what the language learner comes to mentally represent that she did not know before learning occurred. Outputs in (2) are part of the “black box” in (1). These outputs might be words (vocabulary), knowledge of constraints on word combinations (grammar), knowledge of possible sounds of a language (phonetics and phonology), or rules of appropriate language behavior (sociolinguistics and pragmatics). What are the inputs to learning mechanisms? This is a matter of some debate; the debate turning on one’s theory of language learning.

Most researchers use the term *input* in both processing and acquisition research to refer to stuff outside the learner’s mind/brain, physically present in the environment. Yet sounds, visual marks, or gestures produced in a communication may be linguistic or nonlinguistic (e.g., sneezes, doodles, scratching). Learners must crucially distinguish linguistic from nonlinguistic stimuli, and assign to each appropriate functions.

Consider an example of ostensive definition (with gesture) in second language acquisition (SLA); a speaker wants to teach a learner of German a new word. She points to a picture of a male person wearing a black suit, white shirt, and red tie, and says: *Das ist Hubert* [dasisthubert:] ‘That is Hubert.’ For the learner to learn a new word *Hubert*, he must

segment the sound form [hubɛ:t] from speech, infer that it is a word of German, infer that the speaker intends this word to refer to the person in the picture (and not to his haircut, nose, or tie), infer that the depicted entity is indeed a person, and, crucially, infer that the sound form [hubɛ:t] names this particular person and no other person who is wearing a black suit or a red tie. In this learning context, inputs to learning will include the speaker's ostensive intention to refer to Hubert (as cued by pointing), visual cues to Hubert's identity provided by the picture (black suit, white shirt, red tie), and the crucial semantic distinction between proper and common nouns. Thus, input is not merely the speech sounds [dasisthubɛ:t]. Rather it overlaps with features of the learning context and it may also include prior encyclopedic knowledge (e.g., that people tend to bear proper names), and prior linguistic knowledge (e.g., that proper names are noun phrases when they refer).

Two Approaches to Input

There are two basic theoretical approaches to input: *physicalist*, and *mentalist*. Physicalists treat inputs in (2) as identical to inputs in (1), in our example the speech sounds: [dasisthubɛ:t]. Physicalists argue correctly that only physical properties can be directly observed, counted, and analyzed. They conclude, more controversially, that only such properties *should* be primitives in a theory of input processing (Bates & MacWhinney, 1989). Physicalist approaches are the foundation of emergentist SLA theories; they inhere in Corder's (1967) distinction between "input" (what is said to the learner) and "intake" (what the learner "takes in" or processes); they subserve L2 interaction research, itself a by-product of first language acquisition research on the nature of speech used in conversations with children. Exemplar-based research, claiming that learners encode in memory physical instances of speech, also adopts this approach.

Recall that what is available in the physical environment is moving air, marks on a page, pixels on a computer screen, hands and arms in motion. While frequencies of moving air are indeed measured and analyzed in phonetic studies, what is of interest to SLA researchers is how learners come to represent abstract linguistic units, their properties, and constraints on their use. We ask questions like: How many times does a learner have to hear a given *word form* to recognize it in continuous speech? How are word segmentation and word learning affected when *syllable boundaries* do not match *word boundaries*, as in French *les heureux amis* [le\$zœrø\$zami] where the underlined consonant re-syllabifies onto the next word ("\$" indicates the syllable boundary). Do observed developmental stages reflect an increase in the complexity of *sentences* to learners? Such questions about the relationship between input and SLA draw on constructs (*word*, *syllable*, *sentence*) none of which is physically present or directly cued in verbal stimuli.

Mentalist approaches to input define it precisely in terms of such abstract, nonphysical properties (*word*, *syllable*, *sentence*, and many others). If segmentation of a word from the speech signal relies on the ability to compute statistical relationships between syllables (low between *ist* and *Hu-*, high between *Hu-* and *bert*), then input to the learning mechanism extracting words must include representations of syllables. Both *word* and *syllable* are highly abstract constructs; they are also essential inputs to various language-learning problems. It follows that such learning problems cannot be solved unless, or until, syllables and words are mentally represented.

The hypothesis that language learning demands the distinctions encoded in mental representations is the basis for the claim made by generative grammarians that input to language learning is "impoverished." Input is impoverished when there is no physical basis in stimuli for the knowledge that results, as here with respect to *word*, *syllable*, and *sentence*. The claim is made explicit in Carroll's (2001) *autonomous induction theory* (AIT) and Lightfoot's (2006) *cue-based acquisition*. In such theories, mentally represented distinctions

are the inputs in (2). These inputs will include universal meaning–form mappings, such as (PERSON $\leftrightarrow$ NP), a mapping that will permit our learner of German to create a syntactic unit from a representation of Hubert as a PERSON concept. They will also include universal formal constraints on grammars, such as that noun phrases contain a noun head, or that both phrase and head are defined as sets of abstract grammatical features; for example, [+N, –V, 3rd person, +singular, –plural . . .]. For Carroll and Lightfoot, grammatical features and constraints are also part of the input, and universal grammar provides the learner with the ability to cognize the relevance of a linguistic property for a grammatical learning problem. Lightfoot's cue-based learning also hypothesizes that universal grammar provides innate cues to grammatical parameters of crosslinguistic variation. In such theories, studying input requires more than counting the frequency of verbs and modals in speech addressed to learners; it requires a theory of universal grammar.

Numerous studies provide information about the verbal stimuli learners are exposed to in classrooms and in conversation. Yet precise information about the relationship between specific properties of verbal stimuli and what learners actually learn has been slow to emerge. Longitudinal studies of migrant workers showed this population got little exposure to the L2 and many learners fossilized early. The most successful learners were those who acquired native-speaker friends or partners. From this we draw the conclusions “No input, no learning” and “Rich and frequent input, much better learning.” However, these conclusions appear to conflict with first exposure research showing extremely rapid word learning on minimal exposure (Rast, 2008). Part of this conflict can be resolved by the fact that much SLA research assesses learning through cognitively demanding speech production tasks (such as free conversation). Only more recently have researchers attempted to track the time course of initial representations through discrimination and other receptive tasks.

Meaning as Input

The (PERSON $\leftrightarrow$ NP) rule above is an example of how meaning is an input to grammar learning. Language educators have been particularly interested in the role of meaning to promote learning in the classroom. Krashen (1985) formulated the (*comprehensible*) *input hypothesis* attempting to explain the apparent success of immersion education over conventional foreign language tutoring, arguing for enriched input. The input hypothesis states that learners acquire L2 knowledge when presented with comprehensible input. Comprehensible input is speech that is understood but contains linguistic features, constituents, or structures that are just one step beyond the learner's current linguistic competence; that is, these properties are not parsed. These ideas were captured in the slogan “Acquisition = $i + 1$.”

The comprehensible input hypothesis presupposes the logic stated above (“Rich input, better learning”) and led directly to interaction research and VanPatten's input processing theory. As with other ideas, what matters are the technical details: How does knowledge of, for example, the mass/count distinction (2 *books*, *2 *cutleries*, **much book*, *much cutlery*) emerge from the input? Implicit in the input hypothesis (made explicit in VanPatten's research, 1996) is the assumption that grammar is acquired from semantic inputs (as in the (PERSON $\leftrightarrow$ NP) rule). The input hypothesis asserts that comprehended (but not parsable) input results in acquisition. Since the grammar does not yet contain the relevant distinctions, grammar learning must be driven in such cases by inference based on visual or nonlinguistic cues present in the learning context or information activated from memory. However, even a casual reading of a serious grammar book will reveal that the correspondences between meanings and grammar are complex and indirect. We saw above that the meaning of *Hubert* is not “wears a black suit, white shirt and red tie,” although this might be precisely all that the learner knows about Hubert from inspecting a picture

of him. English speakers conceptualize mass nouns like *cutlery* and *furniture* as individuals, not substances, and rely on the presence or absence of plural marking to figure out how to interpret ambiguous words like *stone* (2 *stones*, *some stone*) (Barner & Snedeker, 2005). Such aspects of grammar only partly reflect conceptual contrasts. This well-established fact has clear implications for functionalist approaches to SLA. Long (1996) claimed that the “negotiation of meaning” will drive L2 acquisition forward because interaction with native speakers makes intended meanings clearer. However, speaker intention and speaker meaning may be irrelevant to learning specific grammatical distinctions. MacDonald (2010), for example, shows that intermediate and advanced Korean learners of English can correctly interpret a sentence *Who has more ketchup/shoes?* when looking at pictures. They use conceptual knowledge to decide which referents can be counted (because they are INDIVIDUAL concepts) and which should be assessed in terms of volume (because they are SUBSTANCE concepts). Interestingly, these learners also correctly count out the *furniture* cases. What they cannot do is correctly decide *Who has more stones/Who has more stone?* where making the choice depends on the prior ability to grammatically analyze the presence/absence of the grammatical plural marker. Korean does not have plural marking like English and transfer from Korean in this case is not possible. The moral of the story here is “Much input can be correctly interpreted in the absence of knowledge of plural marking.” So what input would necessitate learning it? The answer is far from obvious.

More Than One Mechanism? Counting Exemplars Versus Extracting Structure

Word frequency is a recurrent factor in discussions of memory and word recall, and patterns of language learning. Its role is, however, complex and indirect. For example, it is a robust finding that lexical categories emerge in spontaneous speech before grammatical words like *a*, *some*, or the complementizer *that*. This result is not due to the absolute frequency of word forms in verbal stimuli. Functional categories are far more frequent in speech than any particular noun or verb. Frequency notwithstanding, words used in concrete references (like *John bought bread*) appear sooner than other kinds of words in spontaneous speech (Klein & Perdue, 1993, p. 4) and appear to be easier to memorize from lists of semantically unrelated words (de Groot & Keijzer, 2000). The evidence that humans are indeed sensitive to statistical properties of verbal stimuli is considerable, but this does not preclude the application of mechanisms that detect, recognize, and extract structure. Indeed, Endress and Bonatti (2007) provide, in the realm of segmentation and word learning, evidence that there are at least two kinds of learning mechanisms: pattern extraction mechanisms and statistical computation mechanisms. Endress and Bonatti found that learners, on the basis of minimal exposure, with little effect of increased familiarity, rapidly extracted word-length forms of three syllables ($\sigma 1\sigma 2\sigma 3$) exhibiting a predictable dependency between the first and third syllable. This pattern is typical of many inflected words, including German regular past participles, such as *ge-mach-t* ‘made’, *ge-spiel-t* ‘played’. These researchers attribute such results to “structure extraction mechanisms,” consistent with input studies revealing a rapid ability to extract generalizations based on meaning–form correspondences, and both phonological and morphological regularities (Carroll, 1999). Importantly, the relationship between the first and the second syllable or the second and the third was much less predictable, with the second syllable functioning like a variable, $\sigma 1X\sigma 3$. This did not mean that learners did not learn items containing sequences such as $Y\sigma 1\sigma 2$ or $\sigma 2\sigma 3Z$. With repeated exposure to the same input, they did. Endress and Bonatti claim that this kind of learning is due to mechanisms computing statistical relations between syllables, which operate more slowly and are affected by increased exposure to input.

Intervention Research

Mentalistic approaches treat feedback and correction to learner errors as forms of input because, when interpreted as an intention to correct, intervention can cue the learner to the presence of errors in her speech or writing. But does it constrain learning? Carroll and Swain (1993) looked at the effects of explicit and implicit feedback (prompts) and correction on the learning of specific kinds of linguistic abstractions related to the English alternations shown in (3):

- (3) a. John gave [a book]₁ [to Mary]₂
- b. John gave [Mary]₂ [a book]₁

After exposure to pairs subjects produced errors like (4):

- (4) John gave to Mary a book.

The goal of the study was not to induce learners to produce (3b) rather than (4), but rather to see whether feedback and correction could lead learners to acquire two *constraints* on the alternation, one of which is prosodic (only verbs which are monosyllabic or have stress on the first syllable can alternate), one of which is semantic (verbs alternate only when the direct object of the preposition *to* is animate). If adult learners are relatively insensitive to the exact form of utterances, as Klein and Perdue (1993, p. 39) assert, then they should not have learned the appropriate prosodic constraints on the alternation in the absence of direct intervention. If intervention can have no effect (as some generativists have asserted), then the alternation would not be learnable at all. In fact, intervention led learners to internalize both constraints on the alternation, showing that at least some abstract properties of grammar can be acquired through intervention.

Since then many laboratory and classroom studies have investigated the effects of recasts, “prompts,” and other forms of interaction, looking at rates of efficacy of one form of intervention over another, and whether learners of one level of proficiency will respond better than learners of another (e.g., Lyster, 1998; Lyster & Izquierdo, 2009). Yet much of this work has been concerned not with how learners initially form correct mental representations of previously unknown distinctions, but rather with issues of recall and planning in speech production. Such work is relevant to fluency of production, accessing memory, and control. The pressing question remains: Do interventions lead the learner to retrench from a too-general generalization on a variety of language-learning problems? On this question, the jury is still out.

Current Trends

Studies that clearly establish a direct (causal) relationship between types of input or directly observable, physical properties of the learning environment, on the one hand, and learning, on the other hand, have been the exception rather than the rule. Input processing research continues to have the flavor of a cottage industry; small groups of individuals conduct studies on diverse kinds of learning problems, with diverse kinds of learners, in diverse learning contexts, using different pairs of L1 and L2. This diversity, perhaps typical of SLA research more generally, makes it difficult to draw firm conclusions. Some researchers have begun looking at absolute beginners to control what prior knowledge of the L2 learners have. In particular, a substantial body of studies on word segmentation now exists using stimuli from artificial languages. This research has implications for common (but unsupported) claims that perceptual salience drives L2 word learning, for in

these studies learners segment words from a continuous sound stream in the absence of prosodic cues to the boundaries of prosodic units. Other studies using natural language stimuli have shown that new words can be segmented after only a small number of exposures. Some researchers have explored how L2 words that sound similar to known L1 words can activate those L1 words, facilitating segmentation. Still other work examines relations across words (like agreement). What remains to be attempted is the kind of long-distance phenomena that require hierarchical structural relations and not merely locally sequenced forms, such as relations between verbs and mood, as in *Je veux que tu t'en ailles* 'I want that you leave', where the verb *ailles* must be in the subjunctive. Here as elsewhere, input processing research seeks to relate SLA current research on both speech and language processing and on learning mechanisms, framing questions by drawing as well on the rich legacy of 150 years of investigation into the sounds and structures of language.

Input-Based Instructional Approaches

EVE ZYZIK

An observable fact of the language acquisition process is that no language, be it the first (L1) or the second (L2), can be learned successfully without extensive and meaningful exposure to that language. Accordingly, all theories of second language acquisition (SLA) attribute a significant role to *input*, which can be succinctly defined as the language in the learner's environment. Input is often referred to as "raw data," "primary linguistic data," the "stimulus array," or the "positive evidence" available to learners. Input can be both aural and written. One of the fundamental questions in SLA is whether input is a sufficient condition for acquisition to occur, or whether other elements (e.g., attention, noticing, feedback, and output) are equally essential. Thus, many instructional approaches combine exposure to the target language with opportunities for output and interaction. Nevertheless, there are some approaches to L2 instruction that prioritize input, many of them proposing innovative ways of manipulating the input in order to maximize learning outcomes.

Since input is a property of the learner's external environment, it can be objectively described in terms of factors such as frequency, consistency, and complexity. However, it is important to point out that measuring input conditions in SLA is much more challenging than in child language acquisition. There is a long tradition in L1 research of tracking a child's linguistic environment and seeing how acquisition parallels what the child is exposed to. For example, Hart and Risley (1995) estimated that children acquiring English as an L1 were exposed to between 10 million and 30 million words between the ages of one and three. Since SLA occurs in various contexts (naturalistic, immersion, and classroom), it is difficult to obtain similar estimates of how much input L2 learners actually get. Nevertheless, some important progress has been made by examining input properties of classroom speech (Collins, Trofimovich, White, Cardoso, & Horst, 2009) and through first exposure studies (Rast, 2008) in which input is carefully controlled and recorded from the initial moment of contact with the target language.

Early Input-Based Approaches

The emphasis on aural input in L2 teaching methods can be traced back to the Direct Method in the 19th and early 20th centuries, which also emphasized speaking and correct pronunciation. Subsequently, in the 1960s and 1970s, input-based approaches were promoted by Asher (1969) and Winitz and Reeds (1973). Beginning in the early 1980s, the case for input was made by Krashen (1982) as part of his Monitor Model, a theory whose central tenet was the Input Hypothesis (later known as the Comprehension Hypothesis). Krashen has consistently defended the idea that language acquisition is primarily a subconscious process driven by exposure to comprehensible input: "we acquire language and develop literacy when we understand messages, that is, when we understand what we hear and what we read" (Krashen, 2009, p. 81). It is evident that Krashen's ideas are not limited to aural input. In fact, the Comprehension Hypothesis has been invoked to make the case for reading programs such as free voluntary reading.

Krashen's theoretical ideas regarding the crucial role of input were implemented in L2 classrooms beginning in the early 1980s through the Natural Approach (Krashen & Terrell,

2 INPUT-BASED INSTRUCTIONAL APPROACHES

1983). The Natural Approach aims to develop communicative ability by providing the learner with abundant input, while at the same time limiting learner production and creating a relaxed learning environment (i.e., a low affective filter). The premise of the Natural Approach is that L2 acquisition is very similar, if not identical, to L1 acquisition. Thus, the classroom should be a space where language development can proceed “naturally” via acquisition activities that do not force learners to speak before they are ready. For example, a typical Natural Approach classroom might involve the teacher telling a story (supplemented with gestures and pictures to make the input comprehensible) and the students demonstrating their comprehension by answering yes/no questions.

As the Natural Approach became increasingly popular in some language programs and served as the basis for a widely used Spanish textbook (*Dos Mundos*), Winitz (1981) developed the Comprehension Approach, endorsing the idea that extensive listening promotes linguistic development. Unique to the Comprehension Approach are the pedagogical materials that accompany it: *The Learnables* (Winitz, 2002) consists of audio lessons and matching picture books. The materials focus on recognition of common vocabulary and structures rather than “authentic” communicative situations. These materials are particularly suited for self-study and can be used to supplement comprehension-based classroom instruction. One of the particularities of *The Learnables* is that learners are explicitly discouraged from repeating the words and phrases they hear, as this is believed to encourage transfer of L1 pronunciation patterns.

Despite some differences, the Natural Approach and the Comprehension Approach share the same fundamental objectives: (a) provide the learner with large quantities of input that is made comprehensible by various means; (b) limit learner production in the initial stages; (c) avoid error correction, except when an error interferes with meaning and impedes comprehension. It should be noted that both approaches adopted earlier techniques, most notably Total Physical Response (Asher, 1969) in which students perform actions (e.g., stand up, sit down) based on the teacher’s verbal commands and physical modeling of them. The Natural Approach also makes use of small-group and pair activities, which are also commonly found in the Communicative Approach.

Contemporary Input-Based Approaches

The methods described previously are broad in scope, that is, no attempt is made to manipulate the input to focus on particular grammatical structures. There exists, however, another category of instructional activities that seek to make a particular feature of the L2 grammar more salient and thus more likely to be noticed by the learner. These activities fit under the broad category of focus on form (FonF), which subsumes a range of pedagogical interventions that aim to draw attention to formal aspects of the language in the context of meaning-oriented activities. Alternatively, these techniques can also be classified as input enhancement, a term first coined by Sharwood Smith (1993) and subsequently used to refer to deliberate attempts to make the input more salient for learners.

One way of making a given feature of the L2 grammar more salient is to increase the frequency with which it occurs in the input, commonly known as an input flood. As the name suggests, an input flood involves manipulating the input in order to “flood” the learners with an increased number of exposures to the target structure. A good example of this technique is found in the research of Trahey and White (1993), who focused on adverb placement in English. They created aural and written materials that contained an abundance of adverbs in all possible positions in English. Learners received one hour of

this specially designed input over 10 days. Most importantly, the learners were not directed to pay attention to the word order of the sentences, making the input flood a truly implicit technique. The results indicate that the input flood was effective in advancing learners' knowledge of grammatical sentences containing adverbs, but did not allow them to discover what is ungrammatical. This suggests that positive evidence may not be sufficient to master certain L2 grammatical structures. VanPatten and Leiser (2006) further note that flooding the input increases the probability that learners will notice a particular form or structure, but it does not guarantee it. Despite these drawbacks, the advantages of input flood are ease of implementation and unobtrusiveness (i.e., it does not disrupt the flow of communication).

Input flood, described above, can make use of both aural and written input. An additional option for increasing the salience of particular forms in written input is text enhancement (TE). This technique involves the use of boldface, italics, or other typographical alterations (e.g., underlining, highlighting) that are designed to promote noticing of the target language form. For example, White (1998) used boldface and highlighting to make the English possessive determiners (*his/her*) more salient for her Francophone learners. That study, however, did not yield beneficial results for learners in the TE group (i.e., all groups showed improvement in attempted production and accuracy). Leow (2001) casts doubt on the efficacy of TE after finding no significant advantages in terms of noticing, comprehension, or intake of textually enhanced forms. A recent meta-analysis of TE (Lee & Huang, 2008) found that learners who read enhanced texts slightly outperformed learners who were exposed to the same forms without enhancement (effect size [d] = .22). In other words, TE was more advantageous than input flooding, albeit by a small margin. Also noteworthy is the finding that TE had a small yet deleterious effect on reading comprehension measures, which suggests that paying attention to form and meaning simultaneously may be difficult for L2 learners.

Another input-based option for targeting problematic grammatical forms is processing instruction. Processing instruction (PI) is a type of FonF that seeks to manipulate the way in which learners process input, thus leading to better intake. Crucially, this approach identifies the specific processing problem that causes learners to ignore some aspects of the input or process it incorrectly. Once the processing problem has been identified, PI activities can be designed to improve learners' processing strategies. This is done through a combination of three components: (a) explicit information about the structure or form (usually provided in the learners' native language), (b) information about the processing strategy they should abandon or adopt, and (c) structured input activities that force learners to pay attention to the form(s) in the input. PI is much more explicit than other input-based techniques (e.g., input flood, TE): learners are told what to notice and how to process it. The structured activities are designed in such a way that the linguistic form must be attended to, which meets the criterion of task-essentialness (Loschky & Bley-Vroman, 1993). Often, this means that the input is stripped of lexical cues to meaning so that priority is given to the form. For example, in order for learners to process past tense morphology correctly, temporal adverbs (e.g., *yesterday*, *last week*) are omitted. Learners indicate their comprehension by matching what they hear to a picture, selecting a response from several options, or writing one-word responses to specific questions. Structured input activities make use of both aural and written input, and there is a progression from individual sentences to connected discourse. PI has generated theoretical debate in the field (DeKeyser, Salaberry, Robinson, & Harrington, 2002) and has been the focus of many empirical studies, including recent attempts to isolate the effects of explicit information as an independent variable (Fernández, 2008).

Conclusion

Input-based instructional approaches have gradually shifted from general comprehension-based methods inspired by Krashen's Input Hypothesis (e.g., Natural Approach) to more focused techniques that manipulate the input to make some features more likely to be noticed, either by increasing their frequency (e.g., input flood) or by altering learners' processing routines (e.g., PI). These contemporary methods span the range from implicit to explicit, whereas the earlier approaches were committed to implicit exposure only. A parallel shift is that input-based approaches have become more accommodating of output. While early comprehension-based approaches intentionally limited learner production and even saw output as potentially harmful, more recent input-based techniques are compatible with output-based approaches and are easily incorporated into task-based and communicative classrooms.

Institutional Ethnography

MEG GEBHARD

Institutional ethnography (IE) is a method of inquiry that describes institutional situations in detail and analyzes how people's actions and interpretations make these situations recognizable as particular kinds of institutional contexts (Smith, 2005). IEs are distinct from other kinds of ethnographies because they attend to how everyday experiences are socially constructed within institutional contexts, such as schools, hospitals, or workplaces. IE is also a form of sociological theory that draws on phenomenology, ethnomethodology, Marxism, and poststructuralist forms of discourse analysis. IE was developed in the 1980s by Dorothy Smith, a Marxist feminist sociologist who was interested in problematizing male-centered and normalizing approaches to understanding social phenomena (Smith, 2005). Her goal was to develop a feminist research strategy for analyzing and potentially changing inequitable social dynamics within organizational contexts by analyzing these contexts from women's perspectives to illuminate how women's lives are shaped by "complexes of relations that are textually mediated" (Smith, 2005, p. 10). She argues that these textually mediated relations of power operate in bureaucratic discourses and form "ruling structures" that organize women's social roles across time and space (2005, p. 10). Using the metaphor of DNA, Smith maintains that socially organized knowledge and ideologies constructed in one location are packaged in bureaucratic forms and then replicated and unpacked in multiple, more distal locations as a means of regulating local activities and social dynamics among individuals (Smith, 1993). These bureaucratic texts therefore wield an enormous amount of power in contemporary life, especially when they are used to justify the allocation of resources.

While initially a methodology used in feminist sociology, IE is now used by researchers in social sciences, education, human services, and policy research to analyze how institutional relations shape not only the everyday worlds of women, but also other nondominant groups. Some examples of IEs include Diamond's (1995) investigation of profit making in nursing homes, DeVault's (2008) edited volume on inclusion and exclusion in workplaces in the New Economy, and Comber and Nixon's (2009) analysis of teachers' work in an era of high-stakes accountability. The methodological features of these studies are that they are interdisciplinary; begin with a microanalysis of everyday practices and then make connections to macropolitical forces; rely on long-term observations, ethnographic field notes, interviews, and institutional documents; use methods that explore how power travels within and across institutional boundaries; and attempt to merge research and practice in service of an equity agenda (Smith, 2005; DeVault, 2006; Taber, 2010).

Institutional Ethnography and L2 Literacy

These conceptual and methodological features of IE are exemplified in studies conducted by several second language (L2) literacy scholars, including Harklau (1994a, 1994b, 2000), Olsen (1997), and Gebhard (2004). These researchers have explored the implications of micro classroom and macro institutional discursive practices on L2 literacies by conducting longitudinal ethnographic case studies of English-language learners (ELLs) attending public schools in the United States. Data types used in these studies included semi-structured

interviews with institutional actors (e.g., students, parents, teachers, administrators), the collection of different types of texts produced by participants (e.g., samples of students' work, teachers' lesson plans, textbooks, students' school records, and policy documents), and detailed field notes from observations of classroom and school life. In addition, these studies analyzed data inductively and recursively by identifying emerging themes and developing analytic codes, which in turn influenced subsequent data collection and analysis. Last, each of these studies relied on the triangulation of data sources and member checking to verify findings.

Harklau (1994a, 1994b) analyzed how tracking structures influenced the language-learning trajectories of four ELLs attending a US high school. She found that low-track classes were poor L2 learning environments because low-track students had exposure to truncated, inauthentic reading material, little practice in composing extended texts beyond the word or sentence level, and few opportunities to participate orally in peer-directed learning activities. As a result, the texts they produced could be described as ungrammatical, awkward, and academically deficient. In a subsequent study conducted in 2000, Harklau used IE methods to follow ELLs in their last year of secondary school and first year in college. She found that those who were constructed as "the good kids" in high school were subsequently characterized as underachieving in their college ESL classes when compared to international students (Harklau, 2000, p. 36). Harklau describes how institutional discourses regarding who ELLs are and the nature of the resources they bring to collegiate studies resulted in tensions between students and instructors, threatened students' persistence in learning academic English, and ultimately weakened their commitment to remaining in college. In line with the goal of IEs to merge research and practice in service of an equity agenda, Harklau concludes that as a result of this study, the college faculty began to reorient their curriculum to draw on the diverse experiences and resources ELLs bring to college ESL instruction.

Similarly, Olsen (1997) describes institutional practices that produce inequities, but examines how issues of race are implicated in the process of L2 learning. In a two-year study she describes how Madison High School (a pseudonym) celebrated diversity on the surface but continued to produce a stratified hierarchy based on English proficiency and race. She writes that the task of learning English in high school "is accompanied by another major task—becoming racialized into a highly structured social order, where one's position is determined by skin color" and where, as a result, one has "very unequal access to resources, opportunities, and education" (p. 11). She illustrates these findings by analyzing the schooling experiences of a recent immigrant from Brazil named Sandra. At the beginning of the study, Sandra felt pressure to define herself as White, Black, or Latino, when these categories ran counter to her understanding of herself as Brazilian. By the end of the study, however, the pressure she felt to fit in led her to place herself on the racialized social map that structured social interactions at Madison High. The peer group she aligned herself with was a group of Latina girls she described as "*cholas* . . . the tough girls" (p. 108). Moreover, Olsen maintains that the socialization of ELLs into racialized peer groups included the adoption of specific dispositions toward school. For students like Sandra who identified with the Latino race track, this meant giving up on the notion that social mobility might be achievable through education. As Olsen makes clear, Sandra's attitude toward schooling was not a matter of succumbing to the whims of her peers. Rather, institutional practices cultivated and reinforced peer group dispositions. For example, Olsen describes two school structures at Madison, one in the Newcomer Center for ELLs and the other at Madison High proper, which tracked students according to their perceived academic ability. Olsen describes the Newcomer Center as a marginal space on campus with overcrowded classes that lacked academic rigor and were taught by inexperienced, often unqualified teachers who described their assignments as "low-status" or "overwhelming" (Olsen, 1997, pp. 167–8).

As a result, Olsen argues, ELLs had serious gaps in their education. Following Harklau (1994b), Olsen says that the portion of the school day in which ELLs attended classes at Madison did little to fill in these gaps because tracking practices assigned Latino and Black students disproportionately to low-level classes and White and Asian students to honor and college preparatory classes, further reinforcing the construction of racialized identities and the creation of race-based conditions of academic advantage and disadvantage (see also Ibrahim, 1999; Talmy, 2008).

Building on Harklau's and Olsen's work, Gebhard (2004) examines how ELLs, teachers, and school administrators attempted to respond to dynamic political, economic, and historical forces shaping school reforms in the United States and how these responses influenced ELLs' academic trajectories and teachers' abilities to act as agents of social change. Using IE methods, Gebhard (2004) analyzed how patterns of institutional and classroom discourses intersected in an elementary school serving Latino and African American families during the height of the economic boom in California's Silicon Valley. This school received funding from a state policy initiative and a high-profile corporate sponsor to implement school restructuring plans representative of organizational changes taking place in "high-tech," "high-performance" workplaces (Gee, Hull, & Lankshear, 1996). These reforms were characterized by a belief that teaching and learning should not be organized to look like factory piecework or the "old work order." Rather, following discourses influencing the organization of "knowledge work" in the "new work order," and the discourses of constructivist pedagogy, school reformers argued that students should participate in project-based, collaborative teamwork in accomplishing purposeful academic tasks and that teachers, administrators, and families should approach the management of schools through shared decision making and a flattening of hierarchical structures (Gee et al., 1996, pp. 24–5).

Gebhard's (2004) analysis demonstrates that restructuring resulted in classroom spaces that were technologically well-equipped and less institutional in character (e.g., access to computers and the Internet, uses of lighting, music, and living room furniture). In addition, students were constructed more as self-directed actors than as consumers of facts, and teachers were positioned more as consultants than as information givers. However, in regard to literacy practices, these reforms also placed ELLs and their families in jeopardy in new and ironic ways. Specifically, becoming and remaining a student at this school meant achieving high scores on standardized tests given in English. Room for negotiating the rights of students who were not proficient in English was possible if parents were able to fit a rather narrow definition of what it meant to be a responsible parent. This definition necessitated that immigrant parents not only have some fluency in English, but also adopt culturally specific roles such as "parents as partners" and "parents as volunteers." The degree to which the parents of focal students understood the roles they were expected to play and/or the degree to which assuming these roles was a possibility varied and had profound implications for their children. For example, one focus student's mother worked as an unpaid bilingual aide for a full year and was thus able to secure her daughter's future at the school. Another mother was able to keep her son in good standing because she played a key role in the school's fund-raising event. However, the parents of a third student, "Alma," had less flexible work schedules and were less proficient in English. Both of these factors contributed to the teachers' perceptions that Alma's family was less able to support her and she would be better off attending a less academically rigorous school despite the fact that her ability to complete assigned tasks over the course of the study was almost identical to her peer ELLs. In providing a microanalysis of Alma's textual practices over two years, Gebhard (2004) shows how ELLs, despite interacting in a well-equipped classroom, still participated in literacy practices that were distinctively modern in character. These practices constructed language as a system of parts and language

learning as the silent assembly of these parts (e.g., the completing of grammar worksheets, copying texts accurately). In addition, teachers evaluated ELLs' work in ways that valued individual activity, adherence to formal rules, and efficiency. These more factory-like approaches to teaching and learning, echoing the logic of the old rather than the new work order, denied ELLs like Alma access to the literacy know-how that was socially distributed around them. As a result, over the two years of this investigation, Alma's ability to produce academic texts changed very little, thus making it unlikely that she would remain enrolled at this school or be able to position herself favorably in the future in the rapid redistribution of wealth and power taking place in the Silicon Valley at the time.

Conclusion and Implications for L2 Research

Harklau's, Olsen's, and Gebhard's research illustrates the potential of using IE concepts and methods in analyzing the academic literacy trajectories of ELLs participating in US educational systems. Collectively, these studies support an argument for pursuing more robust ways of conceptualizing and researching how institutional contexts, teaching contexts, learning contexts, and language development are mutually constructed through discursive practices in schools. In making this argument, Gebhard (1999) calls for a reconceptualization of classroom L2 learning as an institutional phenomenon given that L2 research has tended to render school-based language learning as occurring in isolated islands of classroom practice without analyzing how classroom textual practices are shaped by broader historical, political, and economic forces associated with institutional educational systems. Drawing on the scholarship of Harklau (1994a, 1994b, 2000) and Olsen (1997), as well as theorists such as Halliday and Hasan (1989), Fairclough (1992), and Peirce (1995), she outlines the principles of such a perspective. Following the characteristics of IE, these principles include: (a) grounding an analysis of the origin and structure of students' sociolinguistic knowledge in their daily semiotic practices; (b) analyzing learner variables as socially constructed, not as descriptors of stable mental states; (c) conceptualizing contexts as created by successive turns at talk and uses of print and as influenced by how learners are institutionally positioned in time and space in relation to meaning-making resources (e.g., technology, curricular materials, peer expertise, professional educators); and (d) analyzing the role schools play in legitimating the distribution of privileged discourses, including academic literacies. A research agenda guided by such a framework is needed given the degree to which economic changes, demographic shifts, and new forms of hybrid multimodal communication pose challenges to traditional schooling practices.

Institutional Pragmatics

HANH THI NGUYEN

Introduction

Institutional pragmatics is an umbrella term that refers to research on how linguistic utterances obtain their meanings in the context of institutions, that is, the workplace. Institutional pragmatics is usually not considered a unified subfield of pragmatics, as research on this topic draws on an eclectic range of methodologies and theoretical approaches, including speech act theory, politeness theory, discourse analysis, interactional sociolinguistics, conversation analysis, and critical discourse analysis, among others. Although these approaches and methodologies differ in their perspectives on the study of social interaction, they have all contributed significantly to the understanding of meaning making in institutional contexts. This entry brings together research in diverse and sometimes radically dissimilar approaches in order to provide an overview of how meaning is produced and understood in institutional settings.

Unlike ordinary conversations, language use in the workplace is under certain institutional constraints, which affect how meaning is interpreted and produced. These institutional constraints make up what are called the “*felicity conditions*” for speech acts (Searle, 1969) or the “*frame*” (Goffman, 1974) of the interaction. In Searle’s speech act theory, a speech act’s illocutionary force is realized only when its felicity conditions are met. For example, an utterance such as “I hereby sentence the accused to eight months of imprisonment” achieves its illocutionary force only when produced by a judge in a courtroom. The same utterance, if said outside of this institutional context, for example, at the judge’s home, would not have the same meaning and effect, because its felicity conditions are not satisfied. Another useful way to look at language use in institutional settings is to view the institutional context as the “*frame*” (Goffman, 1974) for participants to interpret what type of activity it is, what is going on, and what roles are being played (see also Thornborrow, 2002, on discursive roles and institutional identities). In the example above, the courtroom setting enables us to interpret the utterance as a court decision with legal implications and that the speaker is a judge. The institution thus provides the context for language use, and participants orient to features of the institution in their verbal and nonverbal conducts.

At the same time, the institution is continually *enacted* in talk. While each utterance and action is shaped by the context of the institution, it also *renews* and *creates* the institution (Heritage, 1984; Drew & Heritage, 1992). By orienting to institutional goals and constraints, participants define what type of institution it is. As an example, let us examine the following excerpt.

Example 1, adapted from Gibbons (2006, p. 253),

- A: What if I try the south pole of this magnet and the north pole of that magnet/ yes Francois/ come on/ a sentence.
B: The south pole and the north pole will attract.
A: Good boy/ good Francois/ all right and let’s try the south pole of this magnet and the south pole of the other magnet/ Stephanie?
C: The south pole and the south pole will repel.
A: Good.

Based on how the participants carry out the interaction, one can surmise that this interaction takes place in a classroom. More specifically, by producing inquiry–response–feedback sequences (Sinclair & Coulthard, 1975; see also Mehan, 1979), the participants index their roles as teacher (A) and students (B and C) and construct the activity as an accountable teaching activity in a classroom context. In short, the institution is both the *product* and the *project* of talk (Drew & Heritage, 1992; see also Sacks, Schegloff, & Jefferson, 1974; Heritage, 1984).

Characteristics of Institutional Discourse

Research on institutional pragmatics demonstrates that talk at the workplace has three main characteristics in contrast with ordinary, casual conversations (Drew & Heritage, 1992). First, participants in workplace interaction typically orient to some *institutionally defined goals, tasks, and identities*. In different institutional contexts, the degree of orientation to these tasks and goals may vary. In emergency phone calls for example, participants orient more strictly to the goals of the interaction (Zimmerman, 1992) than, say, in a language class (Nguyen, 2007) or a service counter at the post office (Carter & McCarthy, 1997). In the first type of institutional context, participants typically do not insert exchanges that deviate from the core goals of the interaction. In contrast, in the second type of context, goal-oriented activities such as instruction giving and correction (in a classroom setting) and requests (in a service encounter) are often interspersed with or embedded in exchanges that orient to relationship building (see also Coupland, 2003; Holmes, 2003). Institutions also vary in how negotiable their goals are. In emergency phone calls, there is little room for negotiation of the interaction's goals, but in some other institutional contexts, for example, visits by nurses to first-time mothers at their homes, participants are shown to negotiate locally what the task is at a given moment in the ongoing talk (Heritage & Sefi, 1992). A second notable feature of institutional talk is that participants usually orient to some specific and implicit *constraints* on what contribution is permissible and what contribution is not. For instance, Zimmerman (1992) showed that in emergency phone calls, when a caller attempted to tell a riddle, the call taker refused to participate in that activity and tried to orient to the official business before terminating the call. Similarly, in patient consultations at the pharmacy, the pharmacist might orient away from extensive storytelling by the patient in order to bring the conversation back to the task of advice giving (Nguyen, 2003). A third and final feature of institutional talk is that participants orient to some *inferential framework* that are specific to each institution. For instance, in a courtroom, the professional may withhold expressions of surprise or sympathy when the lay participant makes certain claims or descriptions that may, in other settings, receive a surprise or sympathy response (Atkinson, 1992). The withholding of these expressions is not treated as disaffiliative because of the inferential framework associated with the given institutional context. Likewise, in job interviews, repairs are often withheld by interviewers when the candidate provides an answer that displays a misunderstanding of the question (Button, 1992). The lack of repair in the context of a job interview is not to be taken as an indication that there are no issues with understanding, but it is taken as an indicator of the candidate's incompetence or inability to answer the question. In short, it is through their orientation to the tasks, constraints, and interpretational frameworks of a given workplace that participants construct the type of speech exchange systems that brings the institution into being.

Research on institutional pragmatics has covered a wide range of topics; the main focus has been on the analysis of how lexical choice, speech acts, the sequential organization of talk, and role relationships are performed as situated in specific institutions.

Lexical Choice in Institutional Discourse

First, lexical choice is a key resource through which participants can index and renew the institutional context in discourse. In the excerpt below concerning a patient's shoulder pain, the doctor uses several technical terms, "adhesive capsulitis" (line 27), "arthritis" (line 169), "tendonitis" (line 170), "bursitis" (line 171), and "adhesive capsulitis" again (lines 171–2). The use of these technical terms indexes and evokes the speaker's role as a doctor as well as the context of the interaction as a medical institution.

Example 2, from Robinson (2003, pp. 37–8),

- 18 DOC: So what can I do for you today.
 19 PAT: W'll- (.) I have (.) som:e shoulder pa:in.
 20 a:nd (0.2) a:nd (.) (from) the top of my a:rm.
 21 a:nd (0.2) thuh reason I'm here is because >a couple
 22 years ago< I had frozen shoulder in thee other a:rm,
 23 an' I had to have surgery. and=() this is starting
 24 to get stuck, and I want to stop it before it gets
 25 stuck.
 26 {(0.4)/.hhhh}
 27 DOC: A[d h e : s i]ve capsuli[tis.]
 28 PAT: [I'm losing] [Ri:gh]t.
 29 PAT: I'm losi:ng (0.4) range of motion in my a:rm.
 ((Doctor performs history taking and physical examination))
 168 DOC: . . . uh: ba:sically (be- ee-) there're
 169 several possibilities. if it's an arthri:tis, .hhh
 170 it's (i- th-) if it's a tendonitis, .h or if it's a
 171 bur:sitis, or even if it's an adhe:sive
 172 capsul>itis=which< [(it's) ve]ry unlikely you
 173 PAT: [Mm hm]
 174 DOC: would have now.

Of note, while the patient uses lay expressions to refer to his condition ("I had frozen shoulder," "this is starting to get stuck," "before it gets stuck," lines 22–5), the doctor reformulates the patient's description into a technical term, "adhesive capsulitis" (line 27). In fact, the patient seems to be familiar with the term (as evidenced in his production of the acknowledgment token "right" in line 28); however, it is the doctor who introduces the term. The participants' different formulation of the same concept may index the asymmetry in their institutionally defined roles.

It is important to note that lexical choice in institutional talk involves not only the choice of technical terms over lay vocabularies, but also the choice among different ordinary formulations. Jefferson (1974), for example, showed how a defendant in court self-corrected and replaced the colloquial term "cop" with "officer," a term that is not technical but serves to index his orientation to the context of the courtroom (pp. 191–2). Other types of formulation that participants may use to orient to the institutional setting involve the choice of references to time, place, and events (Drew & Heritage, 1992), pronouns (e.g., the use of first personal plural pronouns *we*, *us* by doctors, Drew & Sorjonen, 1997), and formulaic expressions (e.g., expressions of concern such as "I'm a bit concerned" in calls to a child protection helpline, Potter & Hepburn, 2003).

In short, a speaker's word choice can index and construct the institutional setting as well as his/her own institutional identity. Word meanings are thus arrived at in the context of the institution and the identities of the people involved.

Speech Acts in Institutional Discourse

Another topic of much research within the scope of institutional pragmatics is speech acts. Here again, various approaches, especially conversation analysis, have shed light on how actions are performed in institutional contexts that are beyond Searle's and Austin's original and limited conceptualization of speech acts. Discourse in a specific institutional setting may contain speech acts that are unique to that setting, such as the *voire dire* is a speech act unique to courtroom interaction (Shuy, 1995). It is, however, more often the case that speech acts found in ordinary conversations are realized slightly differently in institutional contexts. For example, arguments in political interviews are often employed to persuade the audience rather than to seek and provide the validity of an argument as in ordinary conversations (Fetzer, 2007). Another speech act, request, is performed differently in commercial settings and in everyday interaction. In ordinary conversations, requests often have a dispreferred format, that is, having prerequisites and hesitation markers (Schegloff, 2007), due to issues of face and solidarity. These pre-sequences and hesitation markers allow for the requestee to imply a negative response before the actual request is produced. In service encounters, Vinkhuyzen and Szymanski (2005) demonstrated that requests do not usually show a dispreferred format; customers tend to produce their request immediately after the greeting and without any pre-sequences or hesitation. In situations involving a negative response, this procedure leaves the business employee little or no opportunity to indicate prior to the customer's request that it will not be granted. Another difference that was found is that since the customer's request and the business' fulfillment of that request is the main purpose of the encounter, business employees tend to engage in extensive responses when a request cannot be fulfilled; when applicable, these responses may involve suggestions for self-service. For a final example, Maynard (1992) showed that the delivery of bad diagnostic news in medical settings is similar to bad news delivery in ordinary conversation in that it often involves a preface in which the news giver produces talk that allows the news recipient to infer or guess what the bad news is. However, this type of preface is more explicit in encounters between doctors and parents of children with developmental disabilities, and takes the form of perspective-display series, in which the patient's perspective is co-implicated. This procedure then renders the actual bad diagnostic news delivery as confirmation of what has been said and allows the bad news to be presented not as the doctor's independent assessment, but as a co-constructed assessment built on what the patient already knows. The diagnosis, then, has more chance to gain the patient's acceptance.

Structures of Interaction in Institutional Discourse

Much research on institutional pragmatics has also been on the description of the sequential structure of interaction at specific workplaces. The act sequence or the order of events in a given institutional setting contributes to the makeup of the institution and assists in the interpretation of talk and other meaning-making conducts in a given institutional setting. Some institutions have rather fixed sequential structures, for example, plea bargaining sequences (Maynard, 1984). Others have sequential structures that are more negotiated, for example, pharmacist-patient encounters (Pilnick, 2001; Nguyen, 2008; Watermeyer & Penn, 2009). Similarly to the study of speech acts, here, researchers have also found that the same type of sequential structure in ordinary conversations may take on a slightly different shape at the workplace. Jefferson and Lee (1992), for example, demonstrated that while in ordinary conversations the response to troubles-telling by another party normally involves some orientation to the trouble teller, in emergency ambulance service calls, this response often displays orientation to the trouble itself and not the trouble teller. When

the service supplier produces additional responses that also orient to the trouble teller, these responses function to “humanize the service encounter” (p. 544). On the practical level, the description of how actions are sequenced in an institutional setting may provide useful implications to enhance communication. Robinson (2003), for instance, examined the structure of problem solving in acute care visits and found that doctors and patients typically engaged in this sequential structure: Establishing a medical problem as a reason for the visit—gathering additional information (history taking or physical examination)—diagnosis delivery—treatment recommendation. Based on this description, Robinson recommended two ways to encourage more active patient participation in medical encounters: The physician may provide interactional space in the first move for patients to express more than one concern, and the physician may allow for more room for the patient to respond to the delivery of the diagnosis rather than moving on to treatment recommendation right away.

Role Relationships in Institutional Discourse

Finally, an important area of research that falls under the umbrella of institutional pragmatics focuses on the dynamics of role relationship among participants at the workplace, particularly on issues of control and power. Research shows that institutional agents may control the discourse via the management of topics (e.g., Nguyen, 2006, 2008) the management of agenda (e.g., Holmes, Stubbe, & Vine, 1999; Robinson, 2003), the use of questions and question types (Atkinson & Drew, 1979; Harris, 1984; Philips, 1987; Frankel, 1990), the evocation of expert knowledge (Nguyen, 2006), the production of certain speech acts such as directives and approvals (Holmes et al., 1999), the production of and response to accounts (Fisher & Groce, 1990), and the use of second-position (which is more advantageous) in arguments (Hutchby, 1996), to name only a few. Some institutional practices may also marginalize certain groups differentially, leading to asymmetric power relationships. Roberts and Campbell (2005), for instance, informed us that the practices of job interviews in the UK may favor a “standard” narrative, which penalizes non-native candidates who do not know how to manage this interactional resource.

While it is true that the institutional agent often have a higher degree of power and control as defined by the institution, it has been shown that the layperson might utilize certain linguistic resources to resist and undermine this power and control. Haworth (2006), for example, showed that in a police interview, the suspect (in this case, a medical doctor accused of murdering a patient and forging her will) breached the expected question–answer sequences introduced by the police and asserted his own expertise in order to challenge the interviewer’s institutional status (see also Harris, 1989). Along similar lines, Pilnick (1998) showed that a patient with chronic disease may use her knowledge about the condition to resist the pharmacist’s advice in patient consultations. Power relationship at the workplace is not fixed and given, but is continually maintained and negotiated.

Conclusions

In the last few decades, institutional pragmatics has contributed much to the understanding of how meaning is created and interpreted in the context of the workplace. The findings in this area can provide useful implications for intervention and improvement of communication within institutions as well as between institutions and the public. There are, however, several questions that are still open and invite further inquiry. First, as institutions change in the ways they conduct business, naturally further research is needed to examine the changing pragmatics of these institutions. For example, with the fairly

recent trend of outsourced call centers, there has been some research on the pragmatics of this new type of discourse (e.g., Friginal, 2008). Questions about how new technologies and protocols affect meaning making at the workplace will continue to intrigue researchers working on the domain of institutional pragmatics. Another important question that has not yet been fully answered is the development of pragmatic competence in a given institutional setting. Most research on institutional pragmatics to date tends to take the pragmatic competence of the institutional agents as well as laypersons as given and stable. We currently know little about how this competence evolves (Zimmerman, 1999; Sanders, 2003). Efforts to develop this area of research can be seen in the works by Mertz (1996, 2007), who provided a glimpse into the socialization processes in law school classrooms as part of learning to think and talk like a lawyer. Another effort in this area is the works by Nguyen (2003, 2006, 2008) who traced the development of interactional competence by pharmacy novices in patient consultations at real-life pharmacies. Nguyen showed, for instance, how pharmacy novices learned to construct their expert role in discourse, sometimes by withholding technical talk, and how they learned to organize the sequential structure of the interaction in order to accomplish work-related tasks more effectively. Knowledge about how abilities such as these develop in institutional settings can benefit the training of professionals.

Instructed Second Language Acquisition

SHAWN LOEWEN

Instructed second language acquisition (ISLA) refers to the subfield of second language acquisition (SLA) that investigates any type of second language (L2) learning or acquisition that occurs as a result of the teaching of the L2. It has also been called “guided,” “tutored,” or “formal” SLA. Learners’ self-study of the target language can constitute a type of L2 instruction; however, L2 instruction is generally considered to occur within a classroom context. As such, ISLA does not encompass L2 learning that occurs outside the classroom as people use the target language in their everyday lives (sometimes called naturalistic SLA). The defining feature of L2 instruction is that there is an attempt by teachers, or instructional materials, to guide and facilitate the process of L2 acquisition. The value of L2 instruction has been debated, with some theorists claiming that although instruction may help people learn explicit rules about the target language, it has little impact on learners’ ability to use the L2 for communicative purposes. Nevertheless, there is some consensus that, in addition to improving learners’ metalinguistic knowledge, L2 instruction can affect the ways in which L2 features are acquired. It can increase learners’ rate of L2 acquisition, and it is valuable, if not crucial, in assisting learners to achieve advanced levels of target language proficiency.

The implementation of L2 instruction has changed over time, due in part to changes in the dominant theories of first and second language acquisition. However, a perennial controversy is the amount of emphasis that should be placed on grammar instruction versus communication in the L2 classroom. This debate is evident in the characteristics of several influential L2 instruction methods. One early example is the grammar translation method, based on 19th-century methods of teaching classical languages, which relied heavily on the explicit teaching of vocabulary and grammar rules to enable learners to translate texts both from and into the target language. Reactions to the grammar translation method included the direct method, which emphasized the exclusive use of the L2 in the classroom and an inductive approach to teaching grammar rules.

In the 1950s and 1960s, the influence of behaviorism on L2 instruction was seen in the audio-lingual method, which viewed imitation, repetitive drills, and pattern practice as optimal methods of L2 instruction. Subsequently in the early 1980s, the importance of naturalistic types of L2 use and interaction in the classroom were seen in the natural approach (Krashen, 1981; Krashen & Terrell, 1983) and communicative language teaching (CLT) (Savignon, 2005). The natural approach asserted that providing learners with large amounts of comprehensible input was the necessary and sufficient condition for L2 acquisition and that explicit grammar instruction played a limited and non-essential role in L2 acquisition. Similarly, CLT emphasized the importance of using the L2 for meaningful interaction in the classroom and de-emphasized the role of explicit grammar instruction. An example of the implementation of CLT, popular particularly in Canada, has been immersion instruction in which primary and secondary school students attend content classes, such as mathematics and science, in the target language.

However, in the late 1980s and 1990s, researchers found that exclusive reliance on CLT in the classroom did not always result in learners who could use the L2 accurately. As a

result, there were efforts to find effective ways of teaching so that learners' L2 production would be both accurate and fluent. To that end, Michael Long proposed a tripartite distinction in L2 instruction: focus on meaning, focus on forms, and focus on form (Long, 1991, 1996). Focus on meaning instruction coincided with the strong version of CLT, which focused exclusively on communication at the expense of grammar instruction. Focus on forms, similar to traditional grammar instruction, emphasized grammar rules, and the decontextualized presentation of the language. Focus on form was Long's proposal to integrate brief attention to language items within meaning-focused instruction. Types of focus on form include corrective feedback within communicative activities, input flood in which a communicative activity is seeded with numerous exemplars of a targeted linguistic structure, and input enhancement in which targeted linguistic structures are highlighted in some way. In addition to focus on form, several current methods for combining attention to L2 accuracy and fluency include task-based language teaching (TBLT) (Ellis, 2003), content-based instruction (CBI) (Lyster, 2007), and processing instruction (VanPatten, 2004). TBLT employs tasks as a means to engage learners in authentic communicative activities as well as to draw attention to specific linguistic features. CBI is similar to immersion instruction, although typically more support for accurate L2 use is provided. Finally, processing instruction attempts to rectify learners' incorrect L2 processing strategies by providing learners with explicit information about such strategies and then providing learners with input to practice new processing strategies.

In addition to the debate between meaning-focused and form-focused instruction that has shaped many of the approaches to L2 instruction, there are additional factors to consider in ISLA. For example, the degree of explicitness of grammar instruction is currently debated. Perspectives such as CLT and focus on form generally suggest that L2 instruction should be relatively implicit in order to avoid detracting from the communicative aspect of instruction; however, there is increasing evidence suggesting that more explicit types of L2 instruction may be more effective for L2 learning (Norris & Ortega, 2000). Another consideration in L2 instruction is the contrast between deductive and inductive instruction. The former involves explicitly presenting grammar rules to learners, while the latter involves learners in identifying patterns in the L2 input or making comparisons between the first and second languages. Finally, issues such as the duration and intensity of L2 instruction, the optimal age at which to begin L2 instruction, and the role of individual differences in L2 instruction are also important considerations.

In sum, numerous L2 instruction options continue to receive attention both for classroom pedagogy and ISLA research. In spite of different methods and features, the most significant aspect of the field of ISLA remains its investigations into the optimal conditions for L2 learning in the classroom.

Instructional Computer-Assisted Language Learning

CAROL A. CHAPELLE

In second language teaching and learning, computer technology extends the types of interactive activities that learners can work on in and outside of the classroom, and therefore it has affected the way that many teachers teach and learners learn. Teachers might, for example, ask students to seek specific information on the Internet in preparation for an information gap activity in class; teachers might indicate awkward expressions in a student's essay and show the student how to find examples of target language collocations in a corpus; and teachers might organize a virtual collaboration between their students and proficient speakers of the target language in another country. These activities and many more add significantly to the repertoire of activities that learners can engage in because of three affordances offered by technology: human-computer interaction, distance written and oral communication, and access to a community with data and creative opportunities on the Internet.

Learners' Interactions with the Computer

Language learners have a variety of opportunities for interaction with the computer through the use of tutorial software designed specifically for language learning. The best examples contain linguistic input that is interesting and engaging for learners to listen to or read in addition to opportunities for help and practice with the language. For example, learners can watch and listen to videos that have been segmented in a manner that allows for stopping to check for comprehension and to provide the learner with help (Rost & Fuchs, 2004). Help includes repetitions, a dictionary, grammar explanations, and additional images. This process of interactive listening contrasts with non-interactive listening such as one normally does in television watching; interactive listening allows for stopping to get help (Chapelle, 2005).

Helpful interactions are also available to learners as they write and—to some extent—as they plan for speaking. Students can interact with an online grammar checker, dictionary, and corpus of target language texts to gain pertinent help as they write or plan to speak (e.g., Burston, 2001). Interactions that occur as the learner is attempting to use language to make meaning may be particularly rich whether this occurs during comprehension or production (Chapelle, 2003).

Interactions Between Students and Other Language Users

New forms of communication over networks and on the Internet have opened up a range of activities allowing learners to connect, interact, and collaborate with other target language speakers and most notably with peers who are speakers of the target language (Chun, 2008). The first explorations of learners engaging in synchronous written online communication with local peers in the language class (e.g., Chun, 1994) found positive results:

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

DOI: 10.1002/9781405198431.wbeal0546

Each learner seemed to participate more than he or she would in a traditional face-to-face classroom with oral language. Some evidence also suggests that the use of written language for conversation provides good opportunities for acquisition of vocabulary (Smith, 2004) and is an effective adjunct to oral face-to-face conversation, probably because of the opportunity for students to inspect and reflect on linguistic form in the written language (Payne & Whitney, 2002).

Interactions between learners and other language users in remote locations have opened a new set of opportunities for developing pragmatic competence and exploring intercultural communication (Belz & Kinginger, 2003). Students are paired or placed into groups to work on assigned projects as part of their classroom learning with students at a remote location with whom they inadvertently explore the intricacies of cross-cultural communication (Ware & Kramsch, 2005).

Teacher-guided communication and collaborative activities represent only part of what many language learners are doing with computer-mediated communication for language learning. Some language learners seek out additional opportunities for interaction in the target language beyond what they are assigned in class. For example, social networking (e.g., Facebook) can provide connections with peers who speak the target language and opportunities to design sites using the target language.

Linguistic Databases and Web 2.0

The World Wide Web offers many opportunities for learners to access linguistic data and use the target language creatively in Web 2.0, which refers to the types of sites that allow users to create and contribute their own information. The pedagogies for helping learners to use electronic corpora for language study have been discussed by the technology enthusiasts in the field for many years, but now that learners have access to the multimodal collection of linguistic and cultural information on the Web, such pedagogies are more widely useable. In fact, the wealth of authentic texts, dictionaries, and searchable linguistic data creates the opportunity and need for new pedagogies. For example, genre-based writing pedagogy can be developed in new ways through the use of the Internet.

The capacity for creative use of language in conjunction with visual communication is extensive as students construct their own Web sites, blogs, and online communities. Some find that the tools provided in today's electronic environments make possible rich opportunities for project-based learning—sometimes in cross-cultural collaborations (Kern, 2006).

Language Learning?

It is tempting to look at these new opportunities as offering clear benefits for language learning, and some evidence exists for the quality of some of the practices outlined above under some circumstances. However, rather than attempting to assess whether or not such practices are superior to classroom learning, it is useful to note that many of the tools and practices are used by many learners naturally while they are using their foreign language. This fact alone—that learners expect to use technology for language use and learning—provides an impetus for language teachers to incorporate good technology practices into their teaching repertoire.

Computer technology affords professionals in many areas novel perspectives on their everyday practices. In language teaching, it prompts instructors to examine more carefully the processes of language teaching and learning so that they may help to prepare learners to choose and use technologies. In this context, we might conceptualize the language proficiency that is the target of language teaching to include the ability to select and use

technological resources during performance to increase the quality of their writing and speaking production as well as their comprehension in reading and listening.

Integration of Language and Content Learning

BERNARD MOHAN

Mothers and caretakers help their children to learn language and learn about the world simultaneously. How can teachers similarly integrate language and content learning?

Today there are large and increasing numbers of learners who learn content areas and disciplines through the medium of a second language. For many of these students, and particularly for language minority students, second language medium education is challenging. Goldenburg (2008) states that in US national testing in 2007 nearly half of fourth grade students in the English-language learner (ELL) category scored “below basic” in mathematics—the lowest level—and nearly three-quarters scored below basic in reading. His research review finds that students need academic language development for school success. The vital task of integrating the explicit teaching of academic language within content lessons requires the coordination of language and content objectives (Echevarria, Vogt, & Short, 2007). Students need to understand the different ways language is used to construct content knowledge in disciplines like mathematics or history.

Models of language and grammar can be divided broadly into formal models, which describe the language system only, and functional models which describe both the language system and how it is used to make meaning in discourse and context. A functional model of language (Derewianka, 2007) is required to describe academic reading comprehension and how academic language is used to construct content knowledge.

The traditional model of language used in the ELT field is a formal one, identifying the parts of speech and the rules for combining them into sentence structures. While communicative language teaching “foregrounded language use over knowledge of language forms and conceptualized that use in terms of communicative tasks, even the most elaborated assessment framework, that by Bachman and Palmer (1996), upheld the separation of language knowledge from topical or content knowledge” (Byrnes, 2008, p. 37), and did not analyze how language constructs content knowledge in discourse.

We will describe Halliday’s systemic functional linguistics (SFL) model of language and show how it addresses the academic construction of content knowledge in discourse and defines the integration of language and content in linguistic terms.

Language as Functional Resource for Meaning

Halliday views the language system as having three dimensions of meaning: the ideational function, which represents our experience of the world; the interpersonal function, which mediates interaction; and the textual function, which structures the flow of information. Functional grammar describes how each of these dimensions of meaning is encoded in wording (realized in the lexicogrammar). At the center of ideational meaning, for example, is the interpretation of experience as processes involving people and things, which are realized in the functional grammar of the clause as processes, participants and accompanying circumstances (time, place, manner, and so on). Ideational meaning in discourse is close to what is commonly understood as “content.”

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

© 2013 Blackwell Publishing Ltd. Published 2013 by Blackwell Publishing Ltd.

DOI: 10.1002/9781405198431.wbeal0547

Citing research that fewer than one-third of eighth and twelfth graders read at levels necessary for school success, Fang and Schleppegrell (2008) explain how secondary content teachers can foster content area literacies by using functional language analysis to engage students in analyzing the ways language constructs knowledge in science, history, mathematics, and language arts textbooks. Teachers and students discuss the meaning in the language patterns of these texts using a functional metalanguage that covers ideational, interpersonal, and textual meanings. In science, for example, students analyze the technical, abstract, dense, and tightly knit features of science language so that they can understand the scientific knowledge and values it constructs.

Thus, by drawing on an SFL grammar that relates *wording* to *meaning*, learners are better able to interpret the academic *language* of their science textbooks to understand and critically assess their science *content*. In this integrated view, language constructs content knowledge through a grammar of meaning. Mohan, Leung, Low, and Slater (2010) offer an extended discussion of integrated language and content assessment, showing how functional analysis of meaning in text provides a common ground between language assessment and content assessment.

In Halliday's view of language development, which resonates with Vygotskian theory, the child gradually develops the metafunctions of adult language "through constant, contextualized interactions with caregivers who are acutely sensitive to the child's emergent linguistic system and who provide supported opportunities for the child to participate in the negotiation of meaning" (Derewianka, 2007, p. 851). Painter (1999) shows how the child learns the culture system and language system simultaneously through talk, in a dialectic between language system and process, theory and practice. She gives a detailed account of the development of ideational meaning as the child uses language to learn about the world.

Halliday regards language as the primary means of learning about the world, views knowledge or content as meaning, a resource for understanding and acting on the world, and sees learning as a process of making meaning. Language is also the primary evidence for assessment of what a person has learned.

Integrated Assessment

The vexed but crucial area of integrated assessment brings central problems of integration into clear focus. Byrnes (2008) reviews the research literature on assessing content and language, reporting that the field finds it difficult to move beyond the traditional assessment of language as separate from content and that little work is based on a linguistic theory that addresses meaning and content. Obviously there is a "blind spot" which needs overcoming.

Assessment can be divided into summative assessment (assessment *of* learning), performed for the purposes of reporting and grading, and formative assessment (assessment *for* learning), as in classroom-based teacher assessment. For a variety of reasons, formative assessment of integrated language and content offers more promising and strategic avenues of research and development at the present time. For instance, according to a synthesis of more than 4,000 research studies, formative assessment for learning practices can double the rate of student learning (Wiliam, 2007/8).

The Assessment Reform Group in Britain states that formative assessment or assessment for learning should be recognized as a central element in classroom practice:

tasks and questions prompt learners to demonstrate their knowledge, understanding and skills. What learners say and do is then observed and interpreted, and judgments are

made about how learning can be improved. These assessment processes are an essential part of everyday classroom practice and involve both teachers and learners in reflection, dialogue, and decision making. (Assessment Reform Group, 2002, p. 2)

Clearly, language is used as a means of assessment of content in “assessment for learning” dialogues; they are everyday examples of integrative assessment. But to overcome the “blind spot,” such examples require analysis as functional assessment for learning (FAL), that is, functional analysis of language as a means of assessment.

Research on focus on form distinguishes between explicit assessment, where the learners are given explicit feedback on error, rule statements or other metalinguistic explanations, and implicit assessment, where the learners’ attention is directed more implicitly, as in recasts of form. Both explicit and implicit assessments can contribute to learning. We will distinguish similarly between more explicit FAL and more implicit FAL.

In the next two sections, explicit FAL will be discussed in relation to genre and implicit FAL in relation to register. Notice that both genre and register relate wording and meaning, language and content, and therefore integrate language objectives and content objectives.

More Explicit Functional Assessment for Learning

SFL work on genres (Martin & Rose, 2008) initially concentrated on literacy development in the elementary school and focused on the genres to be learned at that level, such as recount, procedure, narrative, and explanation. In this approach, learners are guided to analyze good text examples of a given target genre, noting its stages of schematic structure and the language features that realize them and discussing the role of aspects of ideational, interpersonal, and textual meaning in the text. In other words, students learn to analyze the ways that language constructs knowledge in texts. This is followed by writing texts as a collective activity and later by writing texts independently. An important aim is to develop the learner’s capacity to review and assess instances of text types or genres, and to develop a metalanguage to do so. From an explicit FAL perspective, this capacity is fundamental if learners are to engage in FAL assessment of texts. For instance, in a research account incorporating this approach, Schleppegrell (2010) reports one eight-year-old ESL pupil assessing another’s recount: “Your *recount* doesn’t have an *evaluation*. You need to have a *being* or *sensing process* at the end.”

Later SFL work on genre engaging with the secondary and tertiary curriculum explored how the “subject specific” nature of the language of a discipline constructs the knowledge of the discipline. For example, Schleppegrell, Greer, and Taylor (2008) prepared history teachers to engage students in talk about language and content as they read difficult history texts. Consistent with a movement within history education to focus on improving students’ discipline-specific reasoning, learners analyzed wording that constructs time and cause, attributes agency, and presents judgment and interpretation, using a functional metalanguage, for example, identifying the elements of a clause as processes, participants, and circumstances. Qualitative and quantitative data supported the effectiveness of the approach in improving students’ reading and writing skills in history as well as their overall understanding of historical content. Again, learners and teachers were positioned to engage in explicit FAL while reading history texts critically. A participating history teacher commented metalinguistically on language and content relations: “[My] students need strategies to help them comprehend. The sentence chunking helps students analyze what is happening in history by looking carefully at the processes and participants in the text” (Schleppegrell et al., 2008, p. 182).

More Implicit Functional Assessment for Learning

With respect to a discipline (e.g., the field of mathematics) a register is a resource for creating meanings, a “meaning potential,” a system of meanings which can interpret and produce texts of the field in context. In this view, when teachers assess learners’ knowledge, they are assessing how well the learners construct and interpret meanings of the register of a discipline. This view of register links together the types of implicit FAL strategies below.

Functional recasts (Mohan & Beckett, 2003) are one type of implicit FAL strategy. They occur when an utterance is recast into a more functionally appropriate variant, as when (1a) is recast into (1b), a more literate, academic and scientific variant in the register, by rewording its causal relation into a more grammatical metaphorical form. (1b) is evidence that the teacher has an intuitive linguistic understanding of what is appropriate in the register.

- (1a) ESL Student: To stop the brain’s aging, *we can use our bodies and our heads.*
- (1b) Teacher: [RECAST] So we can prevent our brain from getting weak *by being mentally and physically active?*

Gibbons’s (2006) study of elementary ESL children in a teaching unit on magnetism showed teachers making recasts into a scientific register during teacher guided reporting (TGR). More broadly, the teachers carefully created a cycle of shifts in *mode and textual meaning*, where they guided learners from the practical discourse of here-and-now magnetism experiments to more theoretical, academic discourse requiring explicit statements of knowledge in the register of magnetism. In a study of younger elementary ESL children learning a magnetism unit, Mohan and Slater (2005) describe how the teacher designed and executed the unit to engage learners in a theory–practice dialectic of *field and ideational meaning* between practical meanings of experiments (tasks) and theoretical meanings of magnetism. Finally the teacher formatively assessed the children’s resultant ideational knowledge of the meanings of magnetism by having them interpret the unfamiliar case of ring magnets. In doing so, she guided them to draw inferences from these meanings and give reasons for these inferences, rather than repeat the meanings by rote. Mohan and Slater (2006) found a similar theory/practice dialectic in a grade nine high school science class on matter, where the science teacher built up a framework of ideational meanings in the science register and then formatively assessed them in problem solving tasks which again required the students to draw inferences backed with reasons based on register meanings, for example, drawing inferences from the scientific meaning of “density” as opposed to “weight.”

Thus these teachers showed considerable intuitive understanding of register relations between wording and meaning as they recast, guided student reporting, shifted mode, created a theory–practice dialectic around practical cases, and assessed meanings of registers through reasoned inferences.

Making Implicit Assessment Explicit in a Theory–Practice Dialectic

Can this intuitive understanding be raised to consciousness? In an elementary history class, the teacher explicitly guided ESL students to assess themselves in their cooperative group work, counseling them to decide on answers rather than guess, support answers with reasons, and discuss reasons critically (Leung & Mohan, 2004). Beckett and Slater (2005)

found university EFL students who needed improvement in academic discourse but who participated reluctantly in course work aimed at academic discourse, preferring traditional work on grammar and vocabulary. Beckett and Slater therefore guided action research throughout the course so that students systematically assessed their own ongoing learning experiences for relations between academic language, content, and “academic skills” (e.g., classify, explain). At the end of the course, the majority of the students approved of their integration of language and content learning as a valuable means to academic discourse development.

Such consciousness-raising suggests the future possibility of a more articulated, comprehensive, and systematic FAL.

Conclusion

An appropriate functional model of language and learning treats content as meaning in text and makes it possible to analyze how language constructs and construes content knowledge. Functional assessment for learning is a vital area for future research development and educational practice. Research on explicit FAL needs to extend teachers and learners’ capacity for metalanguages of assessment. Research on implicit FAL needs to identify the range of implicit FAL strategies and help teachers and learners build on them consciously and creatively. And there is a need to expand theory–practice dialectics between explicit and implicit FAL.

Intelligent Computer-Assisted Language Learning

TRUDE HEIFT

Intelligent computer-assisted language learning (ICALL) integrates natural language processing (NLP) and artificial intelligence (AI) modeling into CALL. NLP is concerned with the interactions between computers and human languages, while techniques of artificial modeling aim at creating an individualized learning experience by providing a unique set of system responses and interactions between a learner and the computer. NLP and AI modeling have played a significant role in the development of our thinking about CALL, its design and implementation. For instance, Nerbonne (2003), in his chapter on NLP in CALL in the *Oxford Handbook of Computational Linguistics*, argues that recent advances in NLP have much to contribute to CALL. More specifically, Nagata (1996) concludes from one of her user studies that only CALL programs that make use of the full potential of the computer, mainly by providing immediate and appropriate feedback, will produce higher learning results.

This entry first discusses the challenges that NLP faces in processing human language and then highlights the diversity and range of ICALL applications that have been developed over the past few decades. The entry then focuses on intelligent language tutoring systems (ILTSs), as one particular type of ICALL environment, and describes its pedagogical benefits with respect to corrective feedback and individualized instruction. Some of the findings that have resulted from research with ILTSs and their implications for pedagogy will be presented.

What Is ICALL and What Are the Challenges?

Natural language processing (NLP) is a field of computer science that studies the problems of automated understanding and generation of natural human languages. In natural language understanding, the computer takes written or spoken language input and turns it into a formal representation that captures phonological, graphological, grammatical, semantic, and pragmatic features. In contrast, natural language generation is the reverse process of going from a formal representation to natural language output.

Natural language understanding faces many challenges whereby each language presents its unique problems. For instance, some written languages like Japanese, Chinese, or Thai do not have single-word boundaries. However, any significant automated text segmentation and analysis requires the identification of word boundaries, thus posing difficulties for NLP systems designed for those languages. Second, in most spoken languages, the sounds representing successive letters blend into each other, which makes the identification of discrete characters a demanding task. Moreover, in natural speech there are hardly any pauses between successive words; the location of those boundaries usually must take into account grammatical and semantic constraints, as well as context. Third, language can be highly ambiguous (e.g., lexically, syntactically), which is extremely challenging for automated text and speech processing (for examples see http://en.wikipedia.org/wiki/Natural_language_processing).

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

DOI: 10.1002/9781405198431.wbeal0548

The challenges that NLP faces are compounded when it comes to imperfect or irregular input, commonly found with learner language. In language learning errors occur, not because the student's knowledge is a strict subset of the expert knowledge, but because the learner possesses knowledge potentially different from the expert in quantity and quality. For example, foreign-language learners may commit errors that are influenced by their mother tongue. Accordingly, to process a sentence that in addition to the typical challenges of natural understanding also contains non-native errors can result in an explosion of possible sentence analyses and interpretations, because some of the grammatical constraints that generally mark and identify well-formed sentences are relaxed. For instance, a system designed for native speakers of English puts restrictions on subject-verb agreement. However, errors in subject-verb agreement are typical mistakes made by language learners. Accordingly, for an ILTS to process and analyze such an ill-formed sentence, the constraints on subject-verb agreement must be relaxed for the system to produce a successful sentence analysis.

To address these challenges, statistical natural language processing, for instance, uses methods to resolve some of the difficulties, especially those which arise from the ambiguous use of language that can lead to misinterpretation (e.g., lexical and syntactic ambiguity). Methods for disambiguation commonly involve the use of corpora whereby the NLP system searches through large quantities of text to collect information on the common usage of particular linguistic constructions. In addition, and with respect to learner language more specifically, the processing domain can also be constrained to handle some of the difficulties. For instance, ICALL applications often focus on less sophisticated language such as that produced by beginners or intermediate learners. The task itself can also be limited (more constrained exercises as opposed to open essays) or some error types can be emphasized over others (e.g., morphology versus pragmatics). Finally, systems can focus on a limited set of linguistic components (morphology, lexis, etc.) and/or restrict the text-processing procedures to a shallower level.

The two main components required for natural language processing are a parser and a grammar. A parser is one of the components in an interpreter which checks for correct syntax and builds a data structure implicit in the input tokens that the user provided. Most modern parsers are at least partly statistical; they rely on a corpus of training data which has already been annotated, that is, parsed manually. This approach allows the system to gather information about the frequency with which various constructions occur in specific contexts. The parser often uses a separate lexical analyzer to create tokens from the sequence of input characters. In addition, an ICALL system generally consists of a grammar that defines the valid sentences in a language. Finally, a semantic component is required to analyze the meaning of words or the sentence. These components then allow ICALL systems to create a learner-centered, individualized learning environment by also employing AI methods and techniques that predefine information about the learner and/or the task, thereby resulting in a unique set of system responses and interactions.

ICALL Applications

In addition to more general NLP tools (e.g., automatic speech recognition, text-to-speech synthesis, automatic text summarization, machine translation), a number of ICALL systems have been developed over the past decades. They can be classified into roughly three categories:

- data-driven learning tools,
- text tools, and
- intelligent language tutoring systems.

Data-driven learning tools favor a learner-centered explorative approach, where students are encouraged to try different possible solutions to a problem by, for example, the use of concordance programs that employ annotated unilingual or parallel corpora. The Compleat Lexical Tutor (<http://www.textutor.ca/>), for instance, provides a means for learners of English to encounter and explore words in a variety of contexts. Learners can first search for a word to gain a deeper knowledge of the use and meaning of the word and then complete a task (e.g., a cloze exercise) that is automatically created by the system.

In contrast to data-driven learning tools, text tools consist of foreign-language writing and reading aids, lexical and morphological analyzers, as well as text assessment tools that measure text complexity. For instance, the Microsoft Research ESL Assistant (Leacock, Gamon, & Brockett, 2009) is a prototype Web-based proofing tool that allows ESL learners to examine their writing. The system's architecture consists of a combination of error-correction modules that target specific error types and utilize machine-learned components and heuristic rules. A language model component filters out spurious suggestions.

Finally, intelligent language tutoring systems (ILTSs) have been developed for the past thirty years for a wide range of native and target languages as well as different proficiency levels (Heift & Schulze, 2007). For instance, Robo-Sensei is a commercial ILTS for Japanese for all proficiency levels (Nagata, 2009); TAGARELA teaches Portuguese to beginners (Amaral & Meurers, 2007), and The "etutor" is a comprehensive language-learning environment for all proficiency levels of German (Heift, 2010a). The following section focuses on ILTSs more specifically.

Intelligent Language Tutoring Systems

Unlike Web 2.0 learning environments (e.g., blogs, WebQuests) in which language learners create and design their own space by working collaboratively with peers, ILTSs provide a learning environment in which learning activities are typically performed individually. ILTSs are primarily designed to support form-focused instruction by identifying ill-formed grammatical construction in learner output (see e.g., Schulze, 2008). Interestingly, a recent study by Peters, Weinberg, and Sarma (2009), which compared different learning environments, emphasizes the value and place of form-focused instruction in the current language classroom. Peters et al. (2009) investigated language students' perceptions about the effectiveness of different technologies, and the authors found that traditional types of computer-assisted activities are judged to be more useful than newer activities such as blogs and WebQuests. Moreover, the study revealed that students tend to prefer (and judge to be more helpful) computer-assisted activities that are noninteractive or performed individually.

However, after thirty years of development and research of ILTSs (for a chronology of ICALL systems, see Heift & Schulze, 2007), these systems nowadays are rarely limited to form-focused instruction but instead, and due to their sophisticated underlying technologies, allow for more diverse learning environments. For instance, Dickinson, Eom, Kang, Lee, and Sachs (2008) designed an ILTS that is embedded in a synchronous computer-mediated communication (CMC) environment. The system provides feedback on particle usage for first-year L2 Korean learners while they chat in CMC. Moreover, Harbusch, Itsova, Koch, and Kuhner (2008) designed a virtual writing environment for German for elementary-school children, The Sentence Fairy, which deploys natural language generation technology to evaluate and improve the grammatical quality of student output. Most other ICALL systems provide a combination of form-focused and meaning-focused instruction. For instance, the activity types in the etutor (Heift, 2010a) allow for grammar practice as well as reading comprehension and/or cultural knowledge. In addition, the etutor also supports discovery learning in the form of exploration of learner language. For this, user submissions

were compiled over five years, and from those a common learner corpus was constructed that allows students to explore learner language according to various parameters. Accordingly, learners can examine interlanguage or task-specific phenomena, and the benefits in this respect have been well documented (see Granger, 2003). Moreover, these large data sets also allow language instructors and researchers to examine the design of language learning material in addition to a wide range of other research topics (e.g., use of help options, interlanguage studies).

Learner Feedback

The main advantage of ILTSs over more traditional CALL environments lies in the error-specific feedback that an ILTS can provide in response to learner output. Traditional CALL programs are generally based on string-matching algorithms: that is, the student response is compared letter-for-letter against an answer key. In contrast, using sophisticated NLP technologies an ILTS identifies and interprets errors as well as correct constructions in learner input and generates appropriate, informative learner feedback accordingly.

Over the past decades, research has sought evidence that feedback in CALL makes a difference in language development, and more specifically what kind of feedback makes a difference. One of the early studies investigating different feedback types for Japanese grammar instruction found that “intelligent” feedback (with a metalinguistic explanation) was more effective than traditional feedback (e.g., *wrong, try again!*) (Nagata, 1996). A number of studies followed (see e.g., Pujolà, 2001; Heift, 2010b; Rosa & Leow, 2004; Bowles, 2005) and the results generally support the claim that students benefit from the more explicit feedback, because they subsequently perform better on particular target language structures and students’ grammatical awareness is subsequently raised.

A few studies have also considered learner strategies with respect to corrective feedback in CALL rather than focusing solely on learning outcome. For instance, Brandl (1995) studying L2 learners of German found that the learners’ language skills influence their preference for a particular feedback type in CALL programs. More specifically, results indicate that lower-performance learners have a more limited set of strategies for processing feedback than learners at higher proficiency levels.

Evidence for effects of computer-generated feedback has also been sought in studies examining learner error correction behavior, referred to as learner uptake, in response to distinct feedback types. This body of research (see e.g., Lyster, 2007) proposes that successful uptake is the biggest predictor of learning, and even in instances where no learning takes place at a particular moment, it suggests that learners notice the feedback and thus process it. As a result, researchers tend to view learner uptake as facilitative of L2 acquisition. Findings of studies with ILTSs report significantly more learner uptake for the feedback type that provides detailed corrections (see e.g., Heift, 2010b).

Individualized Instruction

Research in second language acquisition (SLA) has also investigated learner variability, or interlanguage (IL) variation, by examining linguistic, psycholinguistic, and sociolinguistic constraints and with the goal of explaining why speakers choose, consciously or subconsciously, their forms of speech. This body of research has provided evidence of extensive variability in learner language that can be attributed to individual differences, task variables, as well as external variables (see e.g., Tarone, 1988; Gass, Madden, Preston, & Selinker, 1989). All of these are said to affect the learners’ learning processes.

An ILTS can adapt and tailor instructional materials and content to its users with AI techniques that are used to model the individualized learning experience and guide pedagogical decision-making. The goal here is to create learning programs that come closer to natural language interaction between humans than has been the case in traditional CALL. ILTSs. For this, the ILTS constructs a so-called learner model, which is a description of the learner's current skill level along with the student's learning styles and preferences relative to the learning task. Commonly, these models make some assumptions about learners by determining their current knowledge state, which requires the ILTS to observe and record their interaction with the learning system. Measuring learner knowledge, however, is a highly complex task due to a number of variables that have to be considered in assessing and capturing the individual differences that warrant individualization at any given point in time (Heift & Schulze, 2007). A number of learner models have been described and implemented and, most commonly, they are used to generate individualized feedback and unique learning paths for each learner (see e.g., Bull, 2000; Amaral & Meurers, 2007).

Conclusion

ILTSs have added a new dimension to more traditional CALL environments due to their sophisticated underlying technologies. NLP and AI modeling techniques provide the analytical complexity underpinning an ILTS, thereby resulting in a more learner-centered, individualized language-learning environment. Unlike earlier applications that primarily focused on grammar taught in more traditional learning environments, more recent applications reflect a wide range of teaching and learning approaches by also addressing a variety of language skills.

Intelligibility

MURRAY J. MUNRO

Intelligibility is an aspect of speech with far-reaching consequences for human communication. Schiavetti (1992, p. 13) described it as “The match between the intention of the speaker and the response of the listener to the speech passed through the transmission system.” Thus intelligibility is not an inherent characteristic of speech or of speakers, but a consequence of the interplay of linguistic and nonlinguistic factors affecting all the participants in communicative situations. It is of particular importance in second language (L2) teaching, the study of World Englishes, and speech-language pathology. Although intelligibility can be applied to both oral and written language and is influenced by grammar, vocabulary, discourse factors, and pragmatics, this entry focuses exclusively on speech intelligibility, and the aspects of oral production and perception that affect it.

Speakers

In almost all speech acts, speakers aim for intelligibility—to be understood by their interlocutors. Exceptions are rare, though a prisoner of war might feign poor language competency for self-preservation, an entertainer might aim for a comic effect with unintelligible speech, or a child might engage in nonsensical vocal play. Apart from such cases, the results of unintelligibility are almost uniformly negative, ranging from minor inconvenience to injury and death. At the milder extreme are simple miscommunications due to unclear or ambiguous phonetic content that are often repaired through conversational adjustments. Examples of the other extreme are the potentially devastating consequences of misunderstandings between airline pilots and air traffic controllers.

Intelligibility can be compromised by both permanent and transitory characteristics of the speaker. These include speech disorders, and physical or emotional states such as illness, injury, shock, and inebriation. However, the impact of such speaker factors on intelligibility can be understood only in terms of listeners’ responses. Some types of language disorders may render a speaker’s utterances unintelligible to most listeners. Yet family members who are accustomed to hearing disordered speech may comprehend it readily. Likewise, an accent associated with a particular dialect or with L2 learning is not inherently intelligible or unintelligible. Rather, it may be perfectly intelligible to some listeners, but not to others. Brown (1989) also noted that intelligibility is not necessarily reciprocal, such that easy comprehension of accent X by a speaker of accent Y does not automatically entail the reverse.

Intelligibility can vary because of factors within a speaker’s volitional control, such as articulation rate, volume, register, and voice quality. A speaker may adjust these aspects of speech to accommodate the listener. Ferguson (1975) considered speech adjustments for the hearing impaired, children, and L2 adults as different manifestations of the same general phenomenon of “simplified speech.” In fact, an important thread of work in the speech sciences examines how speakers modify their productions when instructed to produce “clear speech,” as opposed to talking in a conversational style (Payton, Uchanski, & Braida, 1994). That research indicates that speakers can intuitively improve their own

intelligibility when speaking in noise or interacting with hearing-impaired people. Parallel work in the fields of first and second language acquisition focuses respectively on “care-giver speech” and “foreigner talk,” both of which aim at enhancing the comprehension of listeners who have not fully acquired a language. Studies of the latter register—speech directed at L2 users—indicate that foreigner talk entails reduced speaking rates with increased pausing, greater loudness, more marked stress, and clearer enunciation. However, these adjustments are not always helpful to L2 listeners, and popular beliefs about their effectiveness are sometimes mistaken. Derwing (1990), for instance, found that increased pausing could actually be counterproductive. In stock humor, speaking more loudly to L2 listeners is often derided as inappropriate, and even regarded as a sign of ignorance on the part of the speaker. Yet the fact that L2 listeners are strongly affected by noise (see below) means that louder speech may actually be beneficial to them even when it would be of no help to native listeners. Understanding the full effects of speech adjustments on listeners continues to be an important topic in empirical work, with many problems as yet unresolved.

Listeners

Just as speakers typically strive to be understood, listeners normally aim to understand. However, different listeners who hear the same acoustic message may respond differently, and even the same listener may find a particular speaker more or less intelligible at different times. Such interlistener and intralister variability result from the listeners’ language experience, attitudes, and expectations, and physical and emotional states that affect perceptual and attentional processes.

The effects of language experience on speech comprehension are linked to language competence and exposure to different accents. Speakers of a particular dialect may understand that dialect better than nonspeakers. Speaking with a particular L2 accent can also afford intelligibility benefits to listeners when they hear speakers with the same accent (Hayes-Harb, Smith, Bent, & Bradlow, 2008). However, the advantage appears to be small and variable across listeners (Major, Fitzmaurice, Bunta, & Balasubramanian, 2002; Munro, Derwing, & Morton, 2006). A variety of familiarity benefits may also exist for native listeners in the comprehension of L2 speech. Gass and Varonis (1984), for instance, found better comprehension when listeners were familiar with the topic, with L2 speech in general, with the specific accent of the L2 speaker, and with the particular speaker. In fact, listeners may show adaptation to L2 speech even after very brief encounters with it (Clarke & Garrett, 2004).

Rubin (1992) found that listeners’ situational expectations can influence how they understand speech. In that study, American listeners who viewed an Asian face when hearing a recorded lecture understood less of the lecture than when they heard the same recording paired with a Caucasian face. Because there was nothing different about the phonetic material in the two conditions, the effect was probably due to the listeners’ stereotyped expectations about speakers from different ethnic backgrounds.

Listeners may show poorer comprehension of speech when they are fatigued or distracted. Another obvious hindrance to speech perception is hearing loss, which may be temporary in some cases, or long-term because of aging. Less well-known, however, is the research showing that even elderly listeners with normal hearing have more difficulty than younger listeners in understanding foreign-accented speech (Burda, Scherz, Hageman, & Edwards, 2003). That effect is probably due to changes in central processing mechanisms that decline with age.

Transmission Systems

Much intelligibility research in the 20th century was concerned with engineering issues relating to transmission systems, notably telephone and radio, as well as to recording devices, room acoustics, and the presence of noise. Virtually all speech transmission entails some noticeable degradation of the acoustic message. Yet listeners can often adapt to less-than-ideal listening conditions by taking advantage of redundancy in the speech signal along with contextual information. One example is the “cocktail party effect” in which listeners succeed at understanding the utterances of a single speaker in a field in which many conversations are simultaneously in progress. Telephone systems entail another type of message degradation in that they transmit acoustic energy up to only about 4 kHz. As a result, minimal pairs such as ‘sit’ and ‘fit’ cannot be distinguished over the phone because the acoustic properties of /s/ and /f/ differ only at frequencies outside that range. Telephone users, however, are rarely aware of this limitation because contextual factors normally help them to recover the speaker’s message.

Brown (1989) noted that speech degradation resulting from transmission systems is of particular concern to L2 speakers, especially those who work in fields in which electronic communications are required. The difficulties they face are twofold. First, L2 speakers tend to experience poorer speech comprehension in reverberation and noise than do native listeners (Takata & Nábělek, 1990). Second, native English listeners sometimes experience a greater decrement in comprehension when hearing non-native speech in noise than when hearing native speakers (Munro, 1998).

Intelligibility Assessment

Intelligibility falls on a continuum, in that the degree of match between a speaker’s intention and the listener’s response varies across situations. To account for this variation, suitable ways of assessing intelligibility are required. However, measurement is complicated by the absence of a single agreed-upon definition of the concept. Nonetheless, the fact that intelligibility arises out of communicative acts requires that it be operationalized in terms of listeners’ responses to speech. Considering the cognitive and sociocultural aspects of intelligibility, one cannot assess intelligibility simply by asking listeners whether or not they have understood something that a speaker has said. In the first place, listeners sometimes believe they have understood an utterance, when in fact they have not (Brown, 1989; Munro, 1998). Second, a declaration that a listener finds a speaker’s utterance unintelligible cannot necessarily be taken at face value, because listeners sometimes have motives for discrediting, humiliating, or discriminating against particular speakers.

To minimize these concerns, researchers have developed a number of protocols for intelligibility assessment. The most widely used measure in the speech sciences is the percentage of words correctly transcribed by listeners in a write-down task. This approach eliminates the problem of having listeners reflect inaccurately on their own comprehension, and concerns about listener biases are partly alleviated because responses from many listeners are pooled for any particular speech sample. Therefore, this type of intelligibility score is not simply the idiosyncratic evaluation of a single listener. Another word-counting approach relies on cloze tests (e.g., Rubin, 1992), in which listeners fill in missing words in a partially transcribed text as they listen to the speaker.

Despite their convenience and apparent objectivity, word-counting approaches sometimes present a misleading picture of intelligibility. For example, missing one critical word in some utterance might obscure the overall interpretation of the message, while missing

several words in some other utterance might still permit a clear understanding. Yet the “words correct” score in the first case would be higher than in the second. Alternative approaches to intelligibility assessment evaluate comprehension at a broader level than individual words. True or false sentence verifications by listeners (e.g., “grass is green”) have been used for both natural and synthetic speech (Munro & Derwing, 1995; Pisoni, 1997). Comprehension questions based on speakers’ narratives have also been employed, and listeners sometimes provide a summary of speakers’ utterances (Perlmutter, 1989).

Applications

Pronunciation Teaching

It is not known when intelligibility was first raised as an issue in L2 pedagogy. In his textbook for language learners and teachers, *The Practical Study of Languages*, Sweet (1900) identified it as a central goal in pronunciation teaching. That view has been echoed throughout the 20th and 21st centuries (Morley, 1991; Derwing & Munro, 2005) and serves as the basis for the “intelligibility principle” (Levis, 2005, p. 370). It contrasts with the “nativeness principle” according to which L2 learners are encouraged to aim for native-like speech production. Even in 1949, Abercrombie argued that the latter goal is not only unnecessary for successful L2 acquisition, but in many cases unachievable, pointing out that effective English pronunciation teaching requires that language specialists determine the phonological factors that most affect intelligibility. Important theoretical discussions of the issue have appeared in the literature since that time. Some of these, such as Catford (1987) and King (1967), have focused on the functional load of segmental distinctions, a frequency-based approach which recognizes that not all minimal contrasts in English are of equal importance. In particular, high functional load contrasts are assumed to be the most critical distinctions for speech intelligibility, and should therefore receive more attention in the classroom. Other discussion concerns the relative significance of segmental and suprasegmental phenomena, with many scholars, including Abercrombie (1949) arguing that suprasegmental factors may be especially important.

Although theoretical approaches to intelligibility provide a helpful framework for understanding the concept, the question of how best to address intelligibility in language teaching must be resolved through empirical testing, which as yet has yielded only modest results. Two lines of empirical work can be identified. The first concerns phonetic influences on intelligibility. Both correlational (Derwing & Munro, 1997) and quasi-experimental (Tajima, Port, & Dalby, 1997) designs are used to identify patterns in L2 speech production that underlie misunderstandings by listeners. A second line of work comprises pedagogical studies in which language learners are tested before and after instruction to determine whether pedagogical interventions lead to a significant improvement in intelligibility (e.g., Perlmutter, 1989). The small number of studies of this type have tended to confirm that a general program of pronunciation instruction can indeed be effective and that a focus on suprasegmentals can also be beneficial. However, care must be taken when applying research findings in the pronunciation classroom because few studies have actually examined intelligibility as a dependent variable. A more common focus in the literature has been accentedness, sometimes on the expectation that matters that affect strength of accent should also affect intelligibility. However, the accentedness construct is of doubtful value in language pedagogy, because it is only partially correlated with intelligibility (Derwing & Munro, 1997, 2005). Therefore, a reduction in accentedness does not necessarily entail an improvement in intelligibility.

World Englishes

For several decades, studies of World Englishes have examined the mutual intelligibility of diverse English varieties (see Nelson, 2008, for an overview). The growing use of English around the world has raised the importance of this issue for international communication and English-language teaching. In one early investigation, Smith and Rafiqzad (1979) presented over 1,300 listeners with speech samples representing US English and English from several regions in Asia, including Hong Kong, India, Japan, and Korea. The listeners, also from various Asian regions, found a US English speaker to be the least intelligible of all. That outcome underscores the fact that inner circle English varieties are not inherently more intelligible than any others, and that expecting international learners of English to emulate native English pronunciation models may sometimes undermine mutual understanding (see Jenkins, 2002). Rather, a pragmatic orientation on English-language teaching requires that learners strive for pronunciation patterns that are intelligible to whatever audience they normally interact with. Studies of English as a lingua franca inevitably regard intelligibility as a central issue as English continues to evolve in different ways around the world.

Aviation

Air traffic control systems depend on radio communications in which noise and distortion are common. Intelligibility is further complicated by the fact that English is the lingua franca of aviation, so that pilots and air traffic controllers speak with a variety of native and non-native accents. Because of these complexities, and the inevitability of human error, American aviation authorities have documented thousands of cases of communication breakdowns, some resulting in major air disasters (Cushing, 1995). Specific miscommunications can be traced to multiple sources including message ambiguity, listener distraction, and equipment malfunction. In some cases, phonetic similarity has compromised intelligibility. Cushing (1995), for example, cites two cases in which ‘to’ and ‘two’ were confused. In one instance, a controller uttered the phrase “cleared two seven,” meaning that runway 27 was cleared for landing. However, the pilot understood the phrase as “cleared to seven” and descended to 7,000 feet. In the other case, the phrase “two four zero zero” was misunderstood as “to four zero zero,” and the pilot descended to 400 feet rather than 2,400 feet. Four deaths resulted from the ensuing crash. These cases point to the need for phonetic analyses of air traffic communications so that appropriate strategies can be developed to prevent their recurrence.

Speech Technology

Technological innovations have led to dramatic growth in the number of human–computer interfaces employing computer-generated (synthetic) speech and digitally manipulated natural speech. The intelligibility of these systems is critical for disabled users who cannot speak—and therefore use a computer to “speak” for them—and for those who require computers to “read” electronic documents to them. It is also important for businesses, libraries, and other organizations that use automated telephone systems to serve their clients. Not surprisingly, much research has focused on assessing listeners’ comprehension of synthetic speech under various listening conditions (see Pisoni, 1997). Intelligibility is assessed using the same protocols described above, so that systems can be adjusted to achieve optimal effectiveness. On a related matter, the growing use of automatic speech recognition (ASR) raises special issues for L2 speakers because ASR software tends to perform poorly on foreign-accented speech. These systems require further refinement if they are to be successfully used with speakers from linguistically diverse backgrounds.

Forensic Linguistics

Forensic investigations sometimes require specialists to determine the linguistic content of poor-quality recordings made with hidden microphones or wiretaps. Intelligibility can also be an issue in the analysis of cockpit voice recordings following an air disaster, particularly if high levels of background noise occurred. Recovering messages in these situations requires a combination of technical expertise to enhance the acoustic properties of the message and knowledge about language to help establish the most likely message content.

Conclusion

Intelligibility is an interdisciplinary topic with important ramifications for all fields of study that entail spoken communication. Many of the theoretical constructs and research protocols now used to investigate intelligibility in applied linguistics are rooted in acoustical engineering and studies of speech and hearing disorders. Despite the very different goals that motivate intelligibility research across disciplines, the vast, still-expanding literature reflects the fact that intelligibility ranks above other concerns in successful human interaction. Without intelligibility, all other aspects of speech become irrelevant because communication—the transmission of a message from one person to another—has already failed.

Intelligibility in World Englishes

CECIL L. NELSON

Intelligibility comes into English ultimately from the Latin verb *intelligere*, “to perceive.” As the “state or quality” of being intelligible, it is commonly and naturally glossed as language that “makes sense” or “is understandable.” Since the purposes of language use (outside any purely aesthetic goals) involve communication, degree of intelligibility must be the primary criterion of success in linguistic exchanges. Making sense comprises such components as transmission of speakers’ or writers’ attitudes toward topics and participants and the category of speech act that given productions represent. For example, an utterance may be intended straightforwardly or ironically, and all participants must share common perceptions of the situation as well as of language use for that production to be perceived as intended. For example, saying “Nice day out” to an acquaintance will be intended and probably received differently if both participants know that the day is sunny and pleasantly warm or that it is rainy and cold.

Thus, intelligibility in a general use may be equated, or nearly so, with “meaning.” However, as the distinctions between semantics and pragmatics show, “meaning” is a broad construct which may depend on elements ranging from linguistic knowledge (e.g., sound inventories and grammaticality) to world awareness (e.g., the current state of the weather or the results of a recent political election).

Putting the right sounds (letters or other symbols, in the case of writing) together in the right order to make recognizable or plausible words, arranging words to create well-formed syntactic phrases, and so on may individually and collectively affect intelligibility. Thus, overemphasizing one or another component in teaching language may be a disservice to learners.

The current situation of English in its diasporas across the world as a primary, principal, secondary, or just additional language, depending on its context, has motivated considerable discussion of intelligibility in the literatures of sociolinguistic research and language pedagogy. Since varieties of English are noticeably—if unsurprisingly—different from one another, the question immediately arises: “Is my English going to be intelligible in a given context, with participants whose variety of English and proficiency in it may be unknown to me in advance?”

One category of proposals to address this concern has involved adoption of a standard English to be promulgated everywhere. Such suggestions naturally call up questions of the model of English that is to fill this role. An often-cited presentation of this view is that of Quirk:

The relatively narrow range of purposes for which the non-native needs to use English (even in ESL countries) is arguably well catered for by a single monochrome standard form that looks as good on paper as it sounds in speech. (1985, p. 6)

Jenkins (e.g., 2007) argues for adoption (by “non-native” English users) of a “Lingua Franca Core” of phonological features. But such proposals leave it unclear who is to teach any single standard variety or how its wide acceptance will be achieved.

Smith (e.g., 1992) is a proponent of a natural development view which accords with the “sociolinguistic realism” of the World Englishes school of thought (e.g., B. B. Kachru, 1985, 1997). In one succinct passage, Smith (1992, p. 75) points out that variety, even to the point of mutual unintelligibility, has always been a part of English, as of any language so globally dispersed. Echoing Catford (1950), Smith asserts that open-minded exposure to as many varieties of English as possible is the way to increase the likelihood and level of intelligibility in new situations and contexts.

Further, Smith has spoken convincingly to components of intelligibility alluded to above (for a summary explication, see Y. Kachru, 2008, pp. 309–11). *Intelligibility* in a narrow, technical application of the word refers to phonological criteria up to the level of producing and apprehending plausible words and collocations. *Comprehensibility* operates over the kinds and scope of variables typically associated with comprehension of or assigning meaning to text. *Interpretability* involves successful transmission and apprehension of motive for a linguistic production.

Thus, the “Nice day out” example is *intelligible* to a recipient who hears the sounds in their component and overall sequences and from them perceives the words and the overall utterance as a valid English sentence (grammatically incomplete, but an assertion nonetheless). It is so intelligible as written on this page, *mutatis mutandis*. The message is *comprehensible* if it conveys its component and overall meanings to the recipient: this is a comment on the current acceptable state of the weather. Considering the hearer’s awareness and appreciation of existing conditions, it may be taken as positive, neutral, or negative (ironic). The recipient’s *interpretation* is perhaps the least under the control of the producer. The utterance may have been intended, and may or may not be regarded as, for example, a mere phatic time-filler, a genial greeting, or a complaint with an implied desire for commiseration.

Degree of intelligibility may be checked, for example, by dictation or repetition tasks (e.g., Smith & Rafiqzad, 1979; Munro, Derwing, & Morton, 2006); comprehensibility by information questions or restatements (Smith & Bisazza, 1982; Kirkpatrick, Deterding, & Wong, 2008); interpretability by means of more detailed investigation of hearers’ or readers’ affective responses (Smith, 1992, pp. 83–4).

Literature on “intelligibility” must be read with attention to given writers’ definitions of the term (and also of “comprehensibility,” etc.). Kirkpatrick, Deterding, and Wong (2008, p. 361), for example, refer explicitly to “the occasional switch [in their text] between the technical and general definitions of [intelligibility],” and “comprehensibility” is defined by Munro, Derwing, and Morton (2006, p. 112) as “the listener’s estimation of difficulty in understanding an utterance.”

Interaction Approach in Second Language Acquisition

ALISON MACKEY AND JAEMYUNG GOO

The interaction approach to second language acquisition posits that learners can benefit from taking part in interaction because of a variety of developmentally helpful opportunities, conditions, and processes which interaction can expose them to. These include input, negotiation, output, feedback, and attention.

Input

Input, as an essential component in the language acquisition process, refers to the language or linguistic data to which learners are exposed in their environment, usually through listening and reading (or in the case of sign languages, from visual/spatial language). L2 (second language) learners develop linguistic knowledge and formulate hypotheses about the language being learned based on input. Because input performs this fundamental and critical function in second language acquisition (SLA), SLA researchers have attempted to describe linguistic patterns and characteristics in the input and investigate how these relate to second language learning. One type of input was originally known as “foreigner talk,” a term coined by Ferguson (1971), who defined it as a “register of simplified speech . . . used by speakers of a language to outsiders who are felt to have a very limited command of the language or no knowledge of it at all” (p. 143). Based on his “foreigner talk” data, Ferguson found that native speakers made numerous adjustments in almost all linguistic areas (e.g., lexicon, phonology, and syntax) in an effort to avoid communication breakdowns and make input more comprehensible to learners. More specifically, foreigner talk is characterized by a slow speech rate with clear articulation, fewer idioms, high-frequency vocabulary, fewer pronoun forms, many definitions, short simple sentences, repetitions and elaborations, and the movement of topics to the front of the sentence, to name just a few (see Hatch, 1983; Ellis, 2008; Gass & Selinker, 2008 for overviews). Another type of input that learners can receive is interlanguage talk defined as speech (as input) addressed to learners by other learners (see Ellis, 2008, for an overview). Interlanguage talk is often less grammatical than foreigner talk, but involves helpful processes like negotiation for meaning, which is widely assumed to be beneficial for L2 learning because learners typically face more communication problems in learner–learner interaction, although negotiation is possible in all conversations regardless of the interlocutor. This sort of input is often studied in a pedagogical L2 classroom context, since L2 learners’ fluency can be enhanced through increased opportunities for language practice (see, for example, Long & Porter, 1985).

Reflecting the important role of input and input modifications to enhance comprehension during interaction, SLA researchers have investigated whether and how different kinds of input affect learner performance in comprehension and production (e.g., Long, 1985; Pica, Young, & Doughty, 1987; Ellis, Tanaka, & Yamazaki, 1994; Gass & Varonis, 1994; Loschky, 1994). For example, researchers have studied a range of input types, including simplified input (premodified input made less complex and more comprehensible), interactionally modified input (modified input through interaction with an interlocutor), and baseline

input (unmodified input). Long (1985) conducted two consecutive experiments of the same kind using two versions of a taped lecture on the topic of Mexico. One was targeted at native speakers, which he called the NS version (baseline version); the other was targeted at non-native speakers, which he called the FT (foreigner talk) version. The FT version was premodified. He observed the benefits to comprehension, comparing the linguistically premodified version and the baseline input version, and found that the NNS (non-native speaker) comprehension was better when the input was premodified than when it was unmodified. However, other research has shown that providing premodified input alone, without negotiation opportunities, may be insufficient for language learning to occur (Pica et al., 1987; Ellis et al., 1994; Gass & Varonis, 1994; Mackey, 1999).

In a related line of work, Pica et al. (1987) examined the impact of interaction on comprehension by comparing two input conditions: interactionally modified input (without premodification, but with opportunities for interaction with a NS), and premodified input (a simplified version using more frequent words and simple structures). Their participants, 16 learners of English as a second language, were asked to pick 15 items and place them on a board based on directions read by the NS. They found that interactional modification resulted in better comprehension than premodified input, and also argued that it was not the reduction of complexity, but the repetition and rephrasing of input content during interaction that facilitated comprehension. Similarly, Loschky (1994) compared three conditions to examine the role of input and interaction in production: (a) unmodified input with no interaction, (b) premodified input with no interaction, and (c) unmodified input with interaction. His results showed that negotiated interaction facilitated L2 comprehension in vocabulary learning compared to non-interaction, and that premodified input did not always guarantee better comprehension. He also suggested that unmodified input with interaction may better serve learners' needs than premodified or unmodified input with no interaction. Gass and Varonis (1994) also found that subjects who had received premodified input were less able in terms of L2 production than subjects who had received unmodified input. Ellis et al. (1994) also argued for the superiority of interactionally modified input in comprehension and vocabulary acquisition, compared to premodified input. Building on this work, Mackey (1999) explored the benefits of interactionally modified input in terms of actual learning, measured as the acquisition of English question forms. She found that the groups that actively engaged in conversational interaction were more likely to show sustained development than the groups that did not. Swain (1985) agreed, arguing that "it is not input per se that is important to second language acquisition but input that occurs in interaction where meaning is negotiated" (p. 246). Next, we turn to how negotiation for meaning during interaction benefits L2 learning.

Negotiation for Meaning in Interaction

As briefly illustrated above, research has shown that negotiation for meaning during interaction results in better learning outcomes than input without interaction opportunities. Negotiation for meaning is important in L2 learning because it provides L2 learners with feedback, comprehensible input and opportunities to produce output, and thus helps to maintain the flow of communication. Long (1996) defines negotiation as "the process in which, in an effort to communicate, learners and competent speakers provide and interpret signals of their own and their interlocutor's perceived comprehension, thus provoking adjustments to linguistic form, conversational structure, message content, or all three, until an acceptable level of understanding is achieved" (p. 418). He suggests that "negotiation for meaning, and especially negotiation work that triggers interactional adjustments by the NS or more competent interlocutor, facilitates acquisition because it connects input, internal learner capacities, particularly selective attention, and output in productive ways"

(pp. 451–2). Not only does negotiation enhance the comprehensibility of the message, but it also makes certain linguistic features of form–meaning relationships salient so that they become more available for acquisition (see also Pica, 1994; Gass, 1997). These potential benefits of negotiation were also emphasized by Pica (1994) who argues that “the twofold potential of negotiation—to assist L2 comprehension and draw attention to L2 form—affords it a more powerful role in L2 learning than has been claimed so far” (p. 508).

Negotiation for meaning involving interactional adjustments or conversational modifications can be initiated by either learners or their interlocutors, whether native speakers or fellow learners. Second language learners can benefit from both types of interactions. Learner-initiated negotiation can lead them to receive interactionally modified input, and interlocutor-initiated negotiation via negotiation moves (or corrective feedback) can lead them to produce modified output. Negotiation for meaning begins with clarification requests designed to elicit clarification of the interlocutor’s preceding utterance (e.g., *What do you mean?*, *What?*, *Pardon me?*), confirmation checks designed to elicit confirmation that the preceding utterance has been correctly understood by the speaker (e.g., *Do you mean X?*, *X, right?*), or comprehension checks intended to check whether the hearer has understood the preceding utterance made by the speaker (e.g., *Do you understand?*, *OK?*). Below is an example of negotiation for meaning that occurs in a NS–NNS dyad in Korean in a foreign language context. In this episode, the NNS initiates a negotiation by making a clarification request (*Cemcangi mwe eyyo?* ‘What is a fortune teller?’) because she does not understand what the NS means by the word *cemcangi* (“fortune teller”), but later obtains a definition of the word by receiving modified output by the NS:

(1) Negotiation for meaning

- NS: *Cemcangi-nun eti isseyo?*
 Fortuneteller-TOP where be-Q?
 ‘Where is a fortune teller?’
- NNS: *Cemcang?*
- NS: *Cemcangi.*
 ‘Fortuneteller.’
- NNS: *Cemcangi mwe-eyyo?* ← Clarification request
 Fortuneteller what-Q?
 “What is a fortune teller?”
- NS: *Cemcangi nun milay-lul malhyecwu-nun salam i-eyyo.*
 Fortuneteller TOP future-ACC tell-give-REL person-be-DEC.
 ‘Cemcangi is the person who tells you the future.’ (Jeon, 2007, pp. 390–1)

As mentioned earlier, negotiation during interaction also provides opportunities for learners to produce modified output, which can lead them to engage in additional cognitive processes, based on feedback that they receive on their problematic production. We now turn to the role of output in SLA within the interaction approach.

Output in Interaction

Output generally refers to the language that L2 learners produce. In a seminal piece of research, Swain (1985) delineated the limitations of input and emphasized the importance of output as evidenced in her analysis of data collected in French immersion classrooms. She pointed out that even after several years of receiving comprehensible input, Canadian French immersion students still failed to accomplish a full capacity in the target system, attributing the failure to the lack of opportunities to produce output and limited interaction. She suggested that second language learners be pushed to produce output, further arguing

4 INTERACTION APPROACH IN SECOND LANGUAGE ACQUISITION

that they need to be “pushed toward the delivery of a message that is not only conveyed, but that is conveyed precisely, coherently, and appropriately” (p. 249). She also added that “being pushed in output, it seems to me, is a concept parallel to that of the $i + 1$ of comprehensible input. Indeed, one might call this the comprehensible output hypothesis” (p. 249). In line with this, Swain, Pica, Holliday, Lewis, and Morgenthaler (1989) suggested that comprehensible output is an outcome of linguistic demands on the part of learners when NSs signal comprehension difficulty. Swain’s (1985, 1995, 2005) comprehensible output (sometimes known as pushed output) changed the conceptual paradigm with respect to output. From a traditional view, output was conceived as a way of practicing what has previously been learned and as a way of eliciting additional input, but Swain extended its role to representing a fundamental part of language learning (Gass & Selinker, 2008). The concept of pushed output is demonstrated in the NS–NNS interaction shown in (2) below, taken from Mackey (2002). The NNS was pushed by the NS to come up with the appropriate expression. This can be seen both in the example, and in the learner’s own words during an interview which took place where the learner saw and heard herself interacting, and was asked what she was thinking at the time of the interaction:

(2) Pushed output

NNS: And in hand in hand have a bigger glass to see.

NS: It’s err. You mean, something in his hand?

NNS: Like spectacle. For older person.

NS: Mmm, sorry I don’t follow, it’s what?

NNS: In hand have he have had a glass for looking through for make the print bigger to see, to see the print, for magnify.

NS: He has some glasses?

NNS: Magnify glasses he has magnifying glass.

NS: Oh aha I see a magnifying glass, right that’s a good one, ok.

Stimulated recall:

In this example I see I have to manage my err err expression because he does not understand me and I cannot think of exact word right then. I am thinking thinking it is nearly in my mind, thinking bigger and magnificate and eventually magnify. I know I see this word before but so I am sort of talking around around this word but he is forcing me to think harder, think harder for the correct word to give him so he can understand and so I was trying, I carry on talking until finally I get it, and when I say it, then he understand it, me. (Mackey, 2002, pp. 389–90)

The excerpt clearly epitomizes Swain’s suggestion that “learners need to be pushed to make use of their resources; they need to have their linguistic abilities stretched to their fullest; they need to reflect on their output and consider ways of modifying it to enhance comprehensibility, appropriateness, and accuracy” (1993, pp. 160–1).

Working from the perspective of output as a learning mechanism, Swain (1995, 2005) proposed three functions of output in SLA, in addition to its obvious role in enhancing fluency (and automatization): noticing, hypothesis testing, and metalinguistic functions. First, for the noticing function, while attempting to produce output learners may notice that they do not know how to accurately say or write what they intend to convey in the target language. Second, the hypothesis testing function indicates that learners test their hypotheses of some forms of the target language by using their output. Lastly, the metalinguistic function enables learners to become aware of their own language as well as their interlocutor’s language use in the output.

Swain and Lapkin (1995) provided empirical evidence of these functions in their study with French immersion students in a writing context using a think-aloud task. While analyzing the think-aloud protocols, they identified units called “language-related episodes” (LREs) to research the benefits of the role of output. A language-related episode was defined as any part of interaction in which learners talked about their language use, including questioning and correcting their language as well as their interlocutors’ language. The results revealed that the three aforementioned functions occurred in this type of output-generating task, and the communicative needs in the task led learners to focus on the form and the accuracy of their output.

Research testing the output hypothesis has been somewhat mixed to date. Izumi, Bigelow, Fujiwara, and Fearnow (1999) found evidence for a beneficial role of output in SLA, providing partial support for its noticing function. However, no empirical support for the output hypothesis in SLA was evidenced in Izumi and Izumi (2004); although there is also some solid empirical support, for example, in McDonough (2005). Example (3) shows modified output in process:

- (3) Modified output
 Learner: what happen for the boat?
 NS: what?
 Learner: what’s wrong with the boat? (McDonough, 2005, p. 89)

In the study from which this example was taken, McDonough (2005) examined the effects of opportunities for modified output on English question development. Clarification requests were selected as a means of eliciting modified output opportunities. Four interactional groups were compared: the enhanced opportunity to modify, opportunity to modify, feedback without opportunity to modify, and no feedback groups. The results showed that modified output following clarification requests was the only significant predictor of English question development.

Feedback in Interaction

Interactional feedback is another crucial feature of interaction. In particular, negative feedback, information involving indication of a learner’s incorrect use of the target language, has received a great deal of attention in interaction research. Negative feedback has been claimed to serve as an effective tool for drawing learners’ attention to L2 forms, helping them to notice their linguistic gaps and focus on specific L2 forms in the subsequent input, which may promote accuracy in their future use and L2 development as a whole (Schmidt, 1990, 1995, 2001; Pica, 1994; Swain, 1995, 2005; Swain & Lapkin, 1995; Long, 1996, 2007; Gass, 1997, 2003).

Recognizing the potential of negative feedback in SLA, White (1987) has argued that the provision of negative feedback can be a useful way of informing French-speaking learners of English that an adverb cannot be placed between a verb and an object in English, which is possible in their L1, French. Because positive evidence or input does not provide any information on the grammatical constraint as to English adverb placement, unless they specifically notice the absence of the word order (subject + verb + adverb + object) in the input that they receive, it is unlikely that they will discover the English constraint on their own. Even though they receive explicit instruction on this constraint, negative feedback functions as an important reminder to learners. In addition, although it is still possible for learners to detect the difference between the French and English adverb placement rules through positive input in their linguistic environment, negative feedback leads learners to

“narrow the range of possible hypotheses that can account for the data,” in the words of Carroll & Swain (1993, p. 358).

Negative feedback can be provided in several different forms with varying degrees of explicitness/implicitness. Explicit feedback clearly indicates that the learner’s utterance or some part of it is ungrammatical (e.g., explicit correction as in *You said X, but it’s ungrammatical, you shouldn’t include Y in it*). Depending upon the type of explicit feedback, the corrected version may or may not be provided; for instance, explicit correction includes the corrected form(s), but metalinguistic feedback does not, so learners need to modify their original utterance, as shown in (4):

- (4) Metalinguistic feedback
 Student: Men are clever than women.
 Researcher: You need a comparative adjective.
 Student: Men are cleverer. (Ellis, 2007, p. 349)

Feedback during interaction can also be delivered in more or less implicit forms, including negotiation moves (i.e., clarification requests, confirmation checks, comprehension checks) and recasts. Implicit forms of feedback are of particular interest within the interaction approach because their interruption of the communicative flow is kept at a minimal level, and thus meaningful interaction is maintained. As in the case of explicit feedback, the corrected form may or may not be included in implicit forms of feedback. Thus, the absence of the corrected form leads learners to self-correct their utterances. For instance, a clarification request does not include the corrected version, but does require learners to modify their original utterance:

- (5) Clarification request and modified output
 NNS: Here and then the left.
 NS: Sorry? ← Clarification request
 NNS: Ah here and one ah where one ah one of them on the left. ← Modified output
 NS: Yeah one’s behind the table and then the other’s on the left of the table. (Mackey & Philp, 1998, p. 339)

Two instances of confirmation checks are observed in example (6). The NS’s confirmation checks signaling lack of clear understanding make the NNS suspect that there was a problem with her utterance. Thus, the NNS produces modified output in an attempt to make her utterance more comprehensible to the NS:

- (6) Confirmation checks
 NNS: There’s a [besən] of flowers on the bookshelf
 NS: a basin?
 NNS: base
 NS: a base?
 NNS: a base
 NS: oh, a vase
 NNS: vase (Mackey, Gass, & McDonough, 2000, p. 473)

Another form of implicit feedback with the corrected form is a recast. Recasts are defined as

reformulation of all or part of a learner’s immediately preceding utterance in which one or more nontargetlike (lexical, grammatical, etc.) items is/are replaced by the corresponding

target language form(s), and where, throughout the exchange, the focus of the interlocutors is on meaning, not language as object. (Long, 2007, p. 77)

In (7), the NS provides a recast by reformulating the NNS's preceding ungrammatical utterance. Then, the NNS modifies some part of her original utterance:

(7) Recast

NNS: Your picture how many how many cat your picture?

NS: How many cats are there in my picture? ← Recast

NNS: Yeah how many cats? (Mackey, 1999, p. 561)

In part because recasts are provided immediately following a learner's ungrammatical utterance, the intended meaning of which has already been understood, they are considered to create optimal conditions for the promotion of L2 learning during interaction (Long, 1996, 2007). Despite ample evidence for a facilitative role of recasts (see Long, 2007, for a review and Mackey & Goo, 2007, for a meta-analysis where they found large mean effect sizes on all three posttests), the role of recasts in L2 learning has been contested in interaction research. Skeptics cast doubt on the effectiveness of recasts in L2 learning on account of relatively fewer instances of immediate learner response to recasts compared to other forms of feedback, such as clarification requests (e.g., Lyster & Ranta, 1997; but see Long, 2007, and Mackey & Philp, 1998, for counterarguments). These skeptics have pointed out that a recast may be interpreted as responding to the content of an utterance, but not the relevant L2 form, or as an alternative way of saying the same thing because reformulations are also provided following grammatical utterances. These properties of recasts may result in relatively fewer instances of learner responses, compared to other types of implicit feedback, which prompt learners to self-repair. Learners may be less able to perceive recasts as corrective feedback in certain linguistic areas not related to meaning such as morpho-syntax (Mackey et al., 2000). However, as recasts do not require learners to modify their output by repeating the recasts they receive or acknowledge, relatively few instances of repetitions of recasts or acknowledgments may be present. And, this lack of immediate response cannot be equated with a lack of L2 learning (Mackey & Philp, 1998; Long, 2007). In fact, without the participatory (response) demands on learners, there may be fewer cognitive demands on them when they receive recasts, giving them additional time to process and learn from them. And indeed, some research has found that immediate responses and learning are not equated, and a great deal of research has found that recasts are associated with L2 learning (see Mackey & Goo, 2007, for a meta-analysis).

In addition to an increasing amount of research on input, output, and corrective feedback, interaction researchers have also investigated L2 learners' cognitive capacities and relevant processes (e.g., noticing) because any benefits of interaction almost certainly depend on L2 learners' cognitive capacities. For instance, learners who are able to notice the corrective nature of feedback may benefit from feedback more than those who are not. This line of research has recently gained much popularity.

Noticing, Attention, and Working Memory in Interaction Research

It has been argued that attention and awareness involved in learners' cognitive processes have significant implications in learning a second or foreign language (e.g., Schmidt, 1990, 1995, 2001; Robinson, 2003). Ideally, learners need to be able to attend to linguistic stimuli in the target language and be aware of input and their own output in any learning context

for subsequent learning to occur. In his noticing hypothesis, Schmidt (1990, 1995) claimed that in order to learn a certain aspect of their L2, learners need to notice the relevant material that they encounter in their linguistic environment, and that awareness at the level of noticing may be a sufficient condition for input to become intake. He further noted that awareness at the level of understanding, which refers to the ability to analyze, compare, and test hypotheses about linguistic input, is helpful, but not necessary. In his later work, Schmidt (2001) softened his stance on noticing, stating that the more learners notice, the more they learn, because it is difficult to prove absence of noticing and to distinguish zero noticing from inability to remember and report what learners have noticed. Schmidt suggested that “intentionally focused attention may be a practical (though not theoretical) necessity for successful language learning” (Schmidt, 2001, p. 23).

In a similar endeavor, Robinson (2003) suggested that attention plays a crucial role in selecting information for processing, dealing with attention-demanding tasks, and maintaining energetic states and performance on a task. He claimed that “noticing involves that subset of detected information that receives focal attention, enters short-term working memory, and is rehearsed” (2003, p. 655). Noticing (and higher levels of awareness), according to Robinson, is the result of rehearsal mechanisms (maintenance or elaborative rehearsal) that send information captured in short-term working memory to long-term memory. He also pointed out that task demands and individual differences in memory and attentional capacities may affect noticing and higher levels of awareness.

Given the possibility that cognitive capacities may determine the level of noticing (e.g., the noticing of input and feedback) during interaction, and because working memory (WM), among other cognitive variables, mirrors the ability to control attentional resources to maintain information while processing, it can be assumed that individual differences in WM may impact the extent to which L2 learners benefit from interaction. Accordingly, L2 interaction researchers have recently begun to investigate this potential relationship between WM and interactional benefits (e.g., Trofimovich, Ammar, & Gatbonton, 2007; Mackey, Adams, Stafford, & Winke, 2010; Mackey & Sachs, in press). In Mackey et al. (2010), learners with higher working-memory capacity (WMC) showed a tendency to produce more modified output than those with lower WMC. Mackey and Sachs (in press) recently conducted a study with nine elderly Spanish-speaking learners of English (mean age: 72) and found a significant association between WM (L1 listening span) and the development of English question forms. Interestingly, Trofimovich et al. (2007) found WM did not play any significant role in L2 learning, nor was it associated with noticing. Obviously, such mixed findings indicate that more research, preferably with larger samples, needs to be conducted in order to confirm or disconfirm the validity of the findings observed in the above-mentioned studies and further examine the interrelationship among WMC, noticing, modified output, and L2 development.

Interactional Sociolinguistics as a Research Perspective

YULING PAN

Introduction

Interactional sociolinguistics (IS) refers to an integrated approach to discourse and language use in interaction. It originated from a scientific inquiry of how to account for linguistic and cultural diversity in everyday communication, how to uncover systematically communicative practices that are shaped by cultural schemas and macrosocial conditions (Gumperz, 1999). "Its theoretical foundation is the notion that expectations and conventions regarding ways of signaling meaning are automatic and culturally relative" (Tannen, 2005a, p. 205) and the primary goal is therefore "to understand how language works to create meaning in interaction" (p. 205). Before discussing the details of interactional sociolinguistics, let us consider an example from a survey interview interaction, in which a Chinese–English bilingual US Census Bureau enumerator is asking for information from a Chinese-speaking immigrant. The enumerator is trying to ascertain if the respondent lived at a specific address on a specific date:

Example: English translation of an interaction in Chinese between a census enumerator (E) and a Chinese-speaking respondent (R).

E: *Did you live here on April 1st?*

R: *This is the situation: we just . . . we just bought this house. Just moved in.*

E: *Ah, you just moved in.*

R: *It hasn't even been ten days.*

E: *Ah, it hasn't even been ten days? Based on what you just said, what about April 1st? Where were you living on April 1st?*

R: *Not here, on April 1st I was in a different place, I was . . .*

E: *Ah, on April 1st you were in a different place.*

R: *We . . . we just moved here on May 1st.*

E: *Ah, you just moved here on May 1st.*

R: *Correct. Correct.*

In this interaction, the enumerator repeated the respondent's answer in almost every turn. Repetition was used as a rhetorical device in order to probe deeper, a means to extract information, or a means of transitioning to another question. At the same time, the enumerator managed to engage the respondent, so repetition also functioned as a means to maintain rapport. This shows that repetition plays an important role in this exchange and is an effective device for communication between two Chinese speakers.

When addressing native English-speaking respondents, Chinese–English bilingual enumerators continued to rely on this repetitive rhetorical pattern, which often led to frustration, exasperation, and passive-aggressive anger on the part of some respondents. They appeared to perceive this literal repetition of their responses as a sign of language incompetency on the part of enumerators.

This example shows that “tiny” linguistic features (such as repetition) have an important role in constructing meaning (Tannen, 2005a, p. 207). However, interlocutors’ interpretations of such linguistic features are affected by their communicative practices which are shaped by cultural schemas, upon which inferences are drawn. In the case of Chinese interviews, repetition is perceived positively. When the same feature is used by a Chinese–English bilingual to English speakers, it leads to misunderstanding and negative stereotypes of the speaker, and it has a negative impact on the interaction.

Interactional sociolinguistics is concerned with issues exactly like these. It seeks to uncover how language functions to evoke the contextual presuppositions that affect interpretation, and what presuppositions are at work in a particular talk exchange (Gumperz, 2001). IS also seeks to provide “replicable methods of qualitative sociolinguistic analysis that can provide insights into the linguistic and cultural diversity characteristic of today’s communicative environments, and document its impact on individuals’ lives” (Gumperz, 1999, p. 453). In the example of the interaction between two Chinese speakers, repetition evokes the presupposition that the speaker is being polite and engaging, as shown by evidence (Pan & Kádár, 2011) that contemporary Chinese politeness is conventionally expressed through discursive strategies, including repetition. The two Chinese participants shared this cultural knowledge of the politeness practice and the norms of interpretation of this linguistic feature. However, in the interaction between an English speaker and a Chinese bilingual, repetition evokes the interpretation that the Chinese bilingual is incompetent or inefficient in English. The shared knowledge needed to interpret repetition is missing and the cultural schemas for interpreting repetition are different.

In the following sections, discussions will center on key concepts in interactional sociolinguistics, its origin and development, its research methodology, and how interactional sociolinguistics can be used as a research tool for studying language interaction in various settings.

Origin and Development

Interactional sociolinguistics has its origin in three disciplines: anthropology, sociology, and linguistics, and is rooted in a deep concern with the interaction between language, culture, and society. Looking at communication from the perspective of linguistic anthropology, John J. Gumperz demonstrated in his influential work *Discourse Strategies* (1982) that speakers can share grammatical knowledge but contextualize utterances differently (based on “contextualization cues”) due to differences in cultural backgrounds. His work makes the following main arguments. First, the meaning, structure, and use of language are socially and culturally relative. This means the interpretation of meaning and language use depends on sociocultural contexts in which the communication takes place, as well as on the sociocultural knowledge of the interlocutors. Second, cognition and language are affected by social and cultural forces; to understand these effects, a theory of communication is needed, integrating grammar, culture, and interactive conventions into a framework of concepts and analytical procedures. Third, what we perceive in an interaction is determined by culture, so communication difficulties can ensue when people from different cultures speak to each other (even if they speak the same language). Finally, these difficulties lead to misunderstandings, stereotypes, and inequalities among individuals. Gumperz’s work laid the foundation for analysis of miscommunication, communication styles, and cross-cultural communication in later IS work.

IS also draws on sociological theories from the work of Erving Goffman on how language is situated in social life, and how it reflects or adds to particular social circumstances (Goffman, 1959, 1981). Goffman’s work on self and society provided two important concepts

for IS: (a) the relationship between interpersonal meanings and social structure are balanced by careful attention to symbolic value of what is said and done, as well as abstract forms of social life; (b) the concept of face, that is, the positive social value a person takes for him- or herself, which needs to be maintained through social interaction. Maintaining face is achieved in avoidance rituals and presentation rituals. For instance, in our opening example, the enumerator was successfully using repetition in order to appeal to the respondent's positive face or his desire to be valued and respected by others; but unfortunately, this contextualization cue did not function in the same positive way in the interaction with the native English speaker.

Gumperz's and Goffman's ideas were incorporated into linguistics by Brown and Levinson (1987), Schiffrin (1987), and Tannen (1989, 2005b) in three distinct areas: linguistic politeness theory, coherence in discourse, and conversational style. Brown and Levinson incorporated Goffman's notion of face and attempted to develop a universal model for linguistic politeness. Their seminal work generated great interest among linguists to study politeness phenomena across cultures. Many linguists, in particular those who have studied politeness phenomena in East Asian cultures (e.g., Ide, 1989; Gu, 1990; Pan, 2000), have contested and modified their politeness model. This has led to the establishment of politeness research as an independent research area (e.g., Watts, 2003; Mills, 2003).

Schiffrin's (1987) work on discourse markers and how coherence is created not only through language but also through aspects of interaction is anchored in an IS perspective. She sees context as the ground motivation for inference and interpretation of ongoing speech activity and that "both the meaning and the motivation of an utterance are contextualized" (Schiffrin, 1994, p. 132).

Tannen's (1989, 2005b) work on conversational style incorporated Gumperz's notion of contextualization cues and exemplified to great detail how conversational styles (e.g., high-involvement styles, in which rapid-fire questioning shows interest and involvement, not intrusion or impatience) were created through linguistic strategies and contextualization cues and the impact that conversational styles had on spoken genres.

Key Concepts

Diversity: Interactional sociolinguistics acknowledges inherent linguistic and cultural diversity in communicative environments and takes diversity as its main research interest and research focus. It aims to pinpoint communication breakdowns or misinterpretations due to different interpretative assumptions that are shaped by cultural differences.

Context: IS takes context as its analytical focal point, asking how language is used to reflect macrolevel and microlevel social meanings. IS focuses on "context and culturally specific situated inferences that members rely on to convey communicative intent" because IS "assumes that the interpretative assessment always builds on locally or context specific background knowledge that takes the form of presuppositions that shift in the course of an encounter" (Gumperz, 1999, p. 458).

Contextualization cues: In Gumperz's terms, "a contextualization cue is any feature of linguistic form that contributes to the signaling of contextual presupposition" (Gumperz, 1982, p. 131). Contextualization cues are aspects of language and behavior that relate what is said to the contextual knowledge that contributes to the presuppositions necessary to the accurate inferencing of what is meant. They include "signaling mechanisms such as intonation, speech rhythm, the choice among lexical, phonetic, and syntactic options . . . said to affect the expressive quality of a message but not its basic meaning" (Gumperz, 1982, p. 16). In this way, contextualization cues inform social interaction and cognitive processes;

they allow interlocutors to “rely on indirect inferences which build on background assumptions about context, interactive goals and interpersonal relations” to interpret what is happening (Gumperz, 1982, p. 2). When speakers share contextualization cues, interaction proceeds smoothly.

Frame: Goffman’s concept of frame is an important tool for IS, used to analyze moment-to-moment interaction. IS focuses analysis on how contextualization cues indicate which frame the interlocutors are in, such as “I’m joking” or “I’m serious,” and whether contextualization cues for the frame at a particular moment are shared by interlocutors. Oftentimes, communication breakdowns or misinterpretations occur due to the misperception of a frame.

Footing: Goffman (1974, 1981) describes footing as “the alignments we take up to ourselves and the others present as expressed in the way we manage the production or reception of an utterance. A change in our footing is another way of talking about a change in our frame of events, . . . participants over the course of their speaking constantly change their footing, these changes being a persistent feature of natural talk” (Goffman, 1981, p. 128). Contextualization cues are important strategies to signal a change in footing.

Face: Goffman’s notion of face (1955, 1967), that is, the positive social value a person takes for him- or herself, which needs to be maintained through social interaction, was incorporated into IS through Brown and Levinson’s (1987) work on linguistic politeness. Brown and Levinson further separated face into “positive” versus “negative” face needs. “Positive face” denotes the wish to be appreciated by others, and “positive politeness” is the fulfillment of this wish. “Negative face” means the wish not to be imposed upon by others, and its accomplishment is “negative politeness.” Politeness is employed when a certain act threatens “face,” that is, it has a redressive (conflict-avoiding) function. Setting out from the claim that politeness is a redressive act, Brown and Levinson argue that in order to describe politeness in a certain culture researchers need to look into “local” strategies of redressing because “cultural differences . . . exist and work down into the linguistic details of the particular face-redressive strategies preferred in a given society or group” (p. 15).

Conversational style: The notion of conversational style originates from Tannen’s (2005b) work analyzing conversation among friends. In Tannen’s view “individual stylistic choices are not random but constrained by overriding stylistic strategies that are conventionalized ways of serving identifiable universal human needs” (p. 17). Conversational style broadly refers to linguistic (lexical or syntactic forms) as well as paralinguistic (speed, pause, or pitch) devices that signal two aspects of universal human needs: connection and distance. Linguistic devices employed to signal the need for connection are called “involvement strategies,” such as claiming commonality, or closeness. Linguistic devices signaling the need for distance are called “independence strategies,” including lexical or syntactic forms of deference or honorifics. Miscommunications arise when participants do not share the same interpretation or perception of the strategies for signaling involvement or independence. For example, Tannen (2005b) showed that, in her study, New Yorkers tended to speak quickly and used high-involvement style, such as asking a series of questions and overlapping with other speakers, while Californians spoke at a much slower pace, and participated minimally in the conversation. What is intriguing is that the differences in conversation style can easily lend themselves to misperception of the speakers.

Research Methodology of Interactional Sociolinguistics

Interactional sociolinguistics draws on naturally occurring talk as data. This includes conversations in various social settings, interviews, or any face-to-face interaction. The analysis depends on transcribed data and looks for breakdowns in communication and then tries to understand the sources for breakdowns. Similar to conversation analysis, IS analyzes turn-by-turn exchanges to understand how participants form inferences based on an utterance. But while CA focuses on uncovering structural or organizational mechanisms (e.g., adjacency pairs, turn-taking practices) in conversations, IS focuses on whether participants share the same conversation mechanisms or the same interpretation for these mechanisms. For example, members of different cultural groups may have different expectations for turn-taking practices (e.g., how long a speaker can hold the speaking turn), or different speeds in talking, or different levels of tolerance for silence in conversation.

IS takes language use in context as its central theme, but its methodology is different from that used in pragmatics. Pragmatics traditionally uses constructed language data to derive a theory about language use. IS departs from this tradition and uses naturally occurring talk as its primary data for investigation, relying on transcribed talk to conduct the analysis and to draw interpretations of communicative practices. But there is one important step in the analysis that IS offers which is different from other methods. That is, an IS analyst would use another set of data to triangulate his/her interpretation of the analysis. For example, Tannen (2005b) played back recorded conversations to the original participants to see if her interpretations or assumptions matched what the participants thought was going on in the conversation. Pan, Scollon, and Scollon (2002) used focus group discussions with participants of recorded telephone conversations to understand their reasons behind an observed practice and behavior.

Gumperz (2001) summarized the IS analysis procedure as consisting of two stages. First, ethnographic research is needed at the initial stage to: (a) provide insight into the local communicative environment, (b) discover recurrent encounter types most likely to yield communicative data relevant to the research problem, and (c) find out through observation, interviewing key participants, and checking one's own interpretations with them how local actors handle the problems they encounter and what their expectations and presuppositions are. In the second stage, the following activities should be conducted: (a) select events that reflect representative sets of interactions for recording, (b) scan recorded materials at two levels of organization: content (lexical, syntactic, etc.) and pronunciation/prosodic information, and (c) produce a transcript including verbal and nonverbal perceptual clues that interlocutors may rely on as part of the inferential process. "This procedure enables us not only to gain insights into situated understandings, but also to isolate recurrent form-context relationships and show how they contribute to interpretation" (Gumperz, 2001, p. 224).

IS research methods make use of ethnographic and linguistic methods to investigate language use in interaction. Scollon and Scollon (2001) summarize it well: after identifying people from different cultural groups who are in social interactions with each other, and through a close analysis of the discourse actually produced,

the analyst would first identify breakdowns in communication, then try to find the sources of the breakdowns in the language used as well as in the misinterpretation of the contextualization cues. Differences between the participants would most likely be understood as arising from a history of socialization to different groups and therefore a misunderstanding of contextualization cues in the actual situation of communicating with each other. (Scollon & Scollon, 2001, p. 545)

Interactional Sociolinguistics: Bridging Theory and Practice

IS has become a widely used method in investigating linguistic interaction in various social settings. The fields that have benefited from IS research are varied, ranging from interpersonal communication and intercultural communication to professional and institutional discourse. In the forefront of interpersonal communication is Tannen's work on gender differences in conversational style (1990, 1994), talk between different generations (2006) and among sisters (2009). The central theme in her work is that human interaction always tries to strike a balance between the needs for connection and independence. Her work offers insights into these dual human needs, and shows how mismatches in conversational style lead to misinterpretation of the exhibited need, and as a result, there is a misperception of individuals using certain conversational styles. Tannen's work has impacted not only the field of sociolinguistics, but also the general population. Through her work, linguistic analysis is seen as something useful and accessible to people who want to know how to improve communication with their family members and coworkers.

IS's contribution to discourse analysis in professional and institutional domains has far-reaching and significant influence on many disciplines, such as medical contexts (e.g., Ainsworth-Vaughn, 1992, 2001; Hamilton, 1994, 2004; Hengst, Frame, Neuman-Stritzel, & Gannaway, 2005; Hamilton, Gordon, Nelson, & Kerbleski, 2006; Ramanathan-Abbott, 2009), court cases (e.g., Shuy, 1982, 2001), and classroom interaction and cultural practices in the educational domain (e.g., Adger, 2001). Discourse analysts have been able to pinpoint the mismatch in expectations or interpretations between interactants which can lead to serious consequences, including social inequality, discrimination, or mutual stereotyping.

Conclusion

Since the establishment of interactional sociolinguistics as a research perspective, discourse analysts have adopted this theoretical stance and analytical framework to analyze discourse and interaction in various social settings and professional domains. Oftentimes their analyses have resulted in practical solutions for real-life problems in human interaction and communication. Scholars in this field are motivated to identify communication problems due to linguistic and cultural diversity and address social issues through examination of language use.

Intercultural Communication

JOCHEN REHBEIN

“Intercultural communication” is the mediation of cultural differences between social groups through verbal or nonverbal interaction. This kind of bridgeover requires specific techniques necessary for creating the participants’ mutual understanding, as will be shown.

Empirical Research on Intercultural Communication

Intercultural communication (IC) as a topic of empirical linguistic research did not arise before the 1960s. Though ethnology and comparative anthropology discussed the concept of culture, structural linguistics described languages in relation to cultures, and the young political sciences dealt with international communication, it was the article of ethnolinguist Hans Wolff on “interlingual communication” in closely related African languages (1964) which opened the view on untranslated cross-cultural verbal exchanges.

Still, culture and language remained abstract addenda to each other; their interwovenness was not the object of consideration. The turn to empirical fieldwork evolved with sociolinguist John Gumperz studying multilingual communities in India and interethnic communication in the USA. Gumperz grounded his research on tape recordings of multilingual talk, using mainly ethnomethodological, conversation-analytic, and communicative-dialectological concepts for a qualitative analysis of the data (Gumperz, 1982, 1992; Gumperz & Roberts, 1991).

From the late 1960s on, due not only to science-internal but also to social developments—as awareness of racism in the USA and, in Europe, of the suppression of linguistic and social minorities and traditional peoples as well as of growing migration from poor to rich, industrial societies—the domain of intercultural communication expanded to a discipline with a vast production of literature. Nowadays, globalization with its worldwide trade and commerce and the flux of capital increases migration and mixes languages and cultures. Questions of IC now extend to nearly all national and international domains of life, generating publications in all academic disciplines. In the view of applied linguistics, one can classify the various strands of IC under the subdivisions of *language politics*, *species of discourses and texts*, *community interpreting and translation*, and *institutional talk* including learners’ discourse.

Main approaches to IC partially overlap, partially complement each other in methods and objects: a semantic-conceptual, mainly comparative approach including semantics of speech acts (Wierzbicka, 1991), an ethnomethodological, conversation-analytic approach including interactional stylistics and rapport theory (Di Luzio, Günthner, & Orletti, 2000; House, Kasper, & Ross, 2003; and many others), and functional-pragmatic discourse analysis (Rehbein, 1985; Knapp, Enninger, & Knapp-Potthoff, 1987; Koole & ten Thije, 1994; and many others). Thanks to these diverse approaches, IC has deployed into a field which combines basic and applied research and in which conceptions about language(s), society, communicative structure, culture, and the role of mental processes are in contest and in argument. (See Risager, 2006 for various approaches to “language” and “culture”; Straub, Weidemann, & Weidemann, 2007 and Spencer-Oatey & Franklin, 2009 for interdisciplinary studies on intercultural competence and communication.)

Misunderstandings

A striking example from John Gumperz illustrates the impact of cultural facets: A black graduate student is sent out after an initial phone contact to interview a black housewife in a low-income quarter. The husband opens the door with a smile:

Husband: So y're gonna check out ma ol lady, hah?

Interviewer: Ah, no. I only came to get some information. They called from the office.
(Husband, dropping his smile, disappears without a word and calls his wife.) (Gumperz, 1982, p. 133)

According to Gumperz, the husband's communicative withdrawal was a reaction to the interviewer's failure to give a formulaic reply (e.g., "Yea, I'ma git some info" (~ I'm going to get some information)) to his own (typically black) formula "check out." Instead, the black interviewer's answering style showed that he was not "on the husband's wave length," proving that the black interviewer and the black interviewee(s) belong to the same ethnic group but to two distinct social groups. Therefore, they lacked a common basis of trust and confidence. Following Gumperz, verbal routines are identifiable according to their phonological, morphological, and lexical forms of expression which are learned "by interacting with others in institutionally defined networks of relationships" (1982, p. 134). Furthermore, the example shows that the communicative difference is due to the difference in the linguistic varieties of the social groups. Therefore, in theorizing IC, "culture" has to be conceptualized as an interactional process instead of opposing alien cultural blocks.

The discourse dependence of understanding and misunderstanding was also illustrated by Bremer, Roberts, Vasseur, Simonot, and Broeder (1996) who deal with transcribed communication between native speakers of a Western European language and immigrant adult second language learners. In House et al. (2003) several taxonomies of misunderstandings are discussed; in most of them, the category "topic" plays an important role, because specific cultural knowledge is projected into the commonality versus noncommonality of discourse topics.

Social Groups and Their Rapports

In intercultural communication, "social group" is the minimal melting pot of *common* knowledge, *common* language, and *common* social strata of social actors (see Straub et al., 2007 drawing on Bourdieu's theory of social classes and groups). In short, groups are constituted by their common stock of *presuppositions* mostly tied to a common linguistic variety, and create, through common verbal and nonverbal forms, *action systems* (Ehlich & Rehbein, 1972).

Individual actors belong to a variety of action systems, for example a group of educators, immigrants, a family, patients, special readerships, linguistic minority groups within a social majority, and so forth, switching action systems if necessary. Thus, action presuppositions do not form a static repertoire of knowledge, but play an active *standardizing* role in individual action.

Action systems have limits which determine the range within which communication occurs. Limits to communication and memberships are difficult to address due to their presuppositional character, of which the individual actors are barely aware, since presuppositions are givens which transcend the individual person. Not until cultural action comes into play is there any reflection on presuppositions, their range and limits (see below).

Several studies by Spencer-Oatey consider the "rapport" between social groups as a principal topic of IC (e.g., Spencer-Oatey & Franklin, 2009). Rapports between social groups

can roughly be subclassified into *cross-societal rapports* (in sojourns in a foreign country, in cross-border communication, with asylum seekers and refugees); *intrasocietal rapports* (majority–minority groups); *institutional rapports* (agent–agent, agent–client relationships); *inter-/intra-generational rapports*. In analyzing IC, each subclass of rapport needs to be made explicit.

Patterns, Institutions, Discourse Types/Genres

Prefabricated structures of communication as patterns of action, institutions, and various types of discourse are often realized by routinized actions as well as connected with expectations of a relatively fixed sequential order. For example, in asking, a person expects to be answered, just as the responding person expects the asking person to appreciate his or her answering—these expectations are constituted as a discourse structure *avant la lettre*.

Early studies of Japanese and other foreigners *making a complaint* in German retail shops prove that, owing to their divergent communicative traditions, actors have divergent expectations regarding both linguistic form and sequences of the complaint. Misunderstandings arise, for instance, when, due to their presuppositions, actors introduce differing *pattern knowledge* into the same constellation of the action. Still, such problems of communication cannot be categorized as merely a “failure,” because actors can build bridges between their divergent knowledge structures on the basis of a common institutional purpose.

Clyne (1994) examined intercultural communication at work in Australian companies executed in English by workers for whom this was not their first language. In coping with the power structures of the workplace, each group of immigrants used their own discourse patterns in order to save their face in terms of their own cultural values. Apologies predominated among Europeans, directives among European men, commissives among Southeast Asian women. Fundamentally, discourse patterns and expectations can be attributed to cultural value systems, more particularly to “sociocultural interactional parameters” (e.g., truth, harmony, uncertainty avoidance, individuality, etc.) and “discourse-cultural parameters” (e.g., content orientation, directionality). This applies to both spoken and written communication.

“Institutions” are functional complexes of varied scope such as medical care, administration, law, school and university, the family, the church, the (public) media, and economic facilities such as production (in companies) and circulation (in trade), and so on. Communication in institutions is prestructured as regards the sequences within the more comprehensive communicative units. The actors inside institutions can be divided into two main social groups: the representatives or *agents*, and the users or *clients* of the institution (see Ehlich & Rehbein, 1994). The particular forms institutions assume are defined by differing social traditions. This affects how institutional sequences are prestructured in the knowledge of agents and clients from different cultural backgrounds, and necessitates cultural bridging particularly in institutional talk (see Rehbein, 1985; Griesshaber, 1987; Clyne, 1994; Pauwels, 1994; Di Luzio et al., 2000; House et al., 2003 among others). Since in many countries trouble-free communication between agents and clients who speak a different language is in the public interest, interpreters and translators are often employed to bridge the communicative gap.

Emotion as Ingredient of Intercultural Communication

Emotions are processes of the mind which may be universal, but their expression often turns out to be culture-specific as well. The reason lies in the *action systems* discussed above, and also in the fact that, linguistically speaking, emotions originate from speech actions

4 INTERCULTURAL COMMUNICATION

like threatening, refuting, insisting, insinuating, and so forth. Take, for example, the typical eastern Mediterranean facial expression of denying by raising one's eyebrows or tilting one's head backwards, or a sojourner's cry for help when in jeopardy that may be incomprehensible for onlookers, that is, possible helpers. In general, this is what happens with the signals of understanding/nonunderstanding in IC: if they are not comprehended, negative emotions tend to be the consequence.

Beside repertoires of nonverbal communication (see Ekman et al., 2009), there are three *linguistic fields* which pragmatics has identified as being salient for the expression of emotion:

- the *incitement field* as interjections of disgust, apprehension, pleasure, surprise, grief, and so forth, including silence;
- the *tinge field* as the mysterious prosody of fairy tales, or the imitating intonation in ironic mimicry; many languages contain a large number of mimetic words, which vividly depict sounds, states of mind, manners of action, and so on—all of them expressive procedures of emotions;
- the *symbol field* (lexicon): emotion has a linguo-conceptual basis (Wierzbicka, 1999) which guides the interpretation of constellations laden with feelings; in IC, frictions due to the interlocutors' distinctive symbol fields of emotion can arise.

Emotions are quasi-automatically called forth, but, nevertheless, are based on interpretations of a constellation (the *gestalt* of a bear is interpreted as danger; see Chafe, 2007). An essential of IC, then, is that, because of difficulties in mutual understanding, the gap of the intercultural differences in the appraisal of emotion becomes sensitive—to one of the participants at least.

For Matsumoto, Yoo, and LeRoux, adjusting one's emotions is important for a successful IC of sojourners and immigrants. This requires thinking "critically about situations, events, and people" and "openness of mind and flexibility to adopt alternative positions to what one is familiar with and accustomed to" (2007, p. 82).

As a consequence, the intercultural gap between the social groups can be bridged by reflexive procedures of discourse which realize aspects of the "cultural apparatus" (see below). Such reflexive procedures could help to downgrade destructive emotions in otherwise conflagratory intrasocietal rapports originated by whatever kind of presuppositions (whether racial, ideological, denominational, etc.). This is best illustrated by the cultural impact of *verbal politeness*, whose linguistic action patterns (e.g., greeting, asking, apologizing, to name just a few) as deep structures of communication are produced in a manner specific to a language.

Beyond Misunderstanding: Discursive Interculture

When the interactants try to build communicative bridges by developing common action systems, this leads to an intercultural discourse or even to a *discursive interculture* (Koole & ten Thije, 1994, p. 200). In their book *The Construction of Intercultural Discourse*, Koole and ten Thije transcend the narrow concept of IC seen as misunderstanding, failure, problems, and deficit. In contrast, they perceive it as the common construction of new forms of understanding. Analyzing transcribed team discussions of Dutch advisers with immigrant teachers of Surinamese, Moroccan, Turkish, and other backgrounds they found that the interactants developed new patterns and discourse forms. This new approach has been thoroughly expanded in Bührig and ten Thije (2006) under the trend-setting title "beyond misunderstanding."

Intercultural bridging of an institutional type was observed in medical discourse in which German doctors gave non-German patients instructions. Perplexingly, actions which ought to have taken place as a result of the doctors' speech actions were often blocked by the patients due to mental reservations in their sequential action position. Eventually, this led to a *cooperative opposition*, which did not erupt into an open quarrel but was not resolved either. The ambivalence inherent in this type of discourse is perhaps best described by the French word *rencontre* (meeting in a friendly or hostile sense). Instead of being a failure of communication, a *rencontre* activates communicative structures which steer the discourse over long stretches (see articles in Pauwels, 1994).

Last but not least, *negotiations* are institutional discourse forms taken up by groups or their representatives with the aim of initiating a process of intercultural communication. They occur in economic, administrative, political, and international institutions (diplomacy) (Ehlich & Wagner, 1995).

Cultural Apparatus: Intercultural Mediation by Reflection

In the above example of an encounter of black persons from distinct social classes, no bridging of the gap ensued because both clung to their presuppositions as routinized forms of speaking and acting. But IC *could* have succeeded if one of the interactants had *reflected* their verbal routines and signaled awareness of the social distance, perhaps by a smile, a gesture, a quip or, even, by a switch into the other's linguistic variety. Thus, standardized forms of acting and speaking which lead to the actors' getting entangled in aporetic ways of communication are *deconstructed through reflection*. At the same time, reflection *construes* means of true understanding by making recourse to a higher level of *mediation*, creating innovative forms of communication. This complex mediation which is an ensemble of specific techniques is to be understood as "cultural action." Successful cultural action may involve a switch of languages or varieties.

On the basis of authentic scenarios, the model of cultural action has been presented in Rehbein (2006) under the term "cultural apparatus." The term "apparatus" refers to Gramsci and to Baudry's "l'appareil de base," meaning a device for—intercultural—mediation by means of restructuring mental processes through *reflexive procedures*. The application of the cultural apparatus is based on a "cultural load" which emerges when routinized forms of interaction are employed. If cultural action is suppressed at these points, because there is no restructuring of the mental processes involved, the cultural load of these forms leads to a process of reifying which insulates the action systems even more strongly against reflection.

Using in-depth analyses of German doctors' inquiring if Turkish and Portuguese patients have questions concerning their upcoming operation, Bührig (2009) found that these patients never had any questions, and draws the conclusion that this has to do with routinized *action practices* presupposed by the doctors themselves. If the doctors had applied the cultural apparatus by means of a comment or another kind of interactional add-on, this could have enabled the patients to voice their own medical interests against predominant institutional routines.

Prejudices are based on the repetitive usage of unquestioned systems of presuppositions which, themselves, stem from previous cultural action and become unreflected knowledge by being repetitively used with everyday familiarity, and so will intersperse IC as a "cultural filter" (House, 1997). The cultural apparatus induces techniques which help to reflect the cultural filter so that, in IC, prejudices are possibly deconstructed.

In a nutshell, the cultural apparatus is a cross-culturally operating device which consists of specific techniques meant to bring about a *reorganization* of underlying mental processes

(as fixed forms of thinking, quasi-automatic emotions, etc.), with the result that the actors suspend the standardized sequence of action and thematize the problems in a process termed “negating action.”

Aspects of Further Research

A principal sector of research is to elaborate empirically based intercultural techniques for *intercultural training* in diverse societal institutions (Spencer-Oatey & Franklin, 2009). A long-term objective of research, therefore, is to *promote multilinguality in intercultural communication* in order to better meet the needs of agents and clients and to improve institutional talk in monolingual settings, too. Especially, the scandalous lack of IC in bureaucracies, asylum-granting institutions, and courtrooms should be focused upon. Important research topics are ideological barriers and clashes between minorities and majorities as well as between groups and societies of different religions. Diverse modes of communication beside the verbal ones, for example nonverbal modes and prosody, should be looked into. Intercultural in the sense of interlingual communication in large, “global” cities with growing immigrant populations is a rising topic of research, in particular multilingual models of living, working, and laughing together should be outlined on the basis of quantitative and qualitative research.

In designing concepts of intercultural learning and formation, one should make use of Byram’s comprehensive model of intercultural competence. Byram shapes a framework of five basic parameters—that is, *savoirs*—against which linguistic, sociolinguistic, and discursive objectives of teaching and learning of intercultural competences can be counter-checked and assessed: *attitudes (savoir être)*, *dispositions/orientations to act (savoir s’engager)*, *knowledge (savoirs)*, and *skills as savoir comprendre and savoir apprendre/faire* (Byram, 1997, chap. 5).

Last but not least, and beyond communication in the well-known lingua francas, the worldwide potential to converse multilingually in closely related languages by means of receptive multilingualism should be sounded (Rehbein, ten Thije, & Verschik, in press). Applying the cultural apparatus seems to be especially necessary in confrontations in economic and political settings (based on cross-societal, intrasocietal, or institutional rapports). Empirical linguistic studies of IC in educational settings yield deeper insight into the intertwining of multilingualism and the cultural apparatus. As we know from the careers of “thirdculture kids” in international schools, the acquisition of several languages does not only increase the sensitivity for a diversity of cultures, but fosters skills in adjusting better and more quickly to unfamiliar environments. Multilingualism enhances the individual’s command of the cultural apparatus.

Intercultural Competence

MICHAEL BYRAM

Competence

“Intercultural competence” has become a sufficiently established phrase to justify the publication of a handbook (Deardorff, 2009). “Intercultural” as a term in language teaching emerged in the 1980s as a development of the concept of “communicative competence,” which was by then widely agreed to be the aim of foreign-language teaching and learning (Byram, 1997, p. 3).

As Fleming (2009) shows, however, the notion of “competence” and competence statements in language teaching is more complex than their unquestioned use in many publications and curricular documents would imply. The use of “competence” ranges from general statements describing an undifferentiated global ability in the formulation of teaching and learning purposes, to the precise descriptors of specific observable behaviors, often referred to as “can-do” statements. Yet none of these uses is precise until contextualized and exemplified. “Intercultural competence” is a phrase best used when describing a person’s abilities in context.

Models of Intercultural Competence

Models of intercultural competence (IC) are thus only a first stage of clarification. They begin to describe different aspects of IC for a variety of purposes. Models themselves have different functions and often hide a normative purpose behind a descriptive appearance. What Spitzberg and Changnon (2009) call “adaptational models” may describe what happens to people in a new environment but may equally imply a moral obligation that they should adjust or adapt to that environment.

Models of IC can be differentiated in terms of their disciplinary origins. Many are psychological. They attempt to describe or prescribe the psychological stages of response to a new environment. One influential stage model of “intercultural sensitivity” (Bennett, 1986) defines a continuum of responses and implies that moving from stages of ethnocentricity to stages of ethnorelativity is a matter of progress, and is highly desirable. Another influential model (Byram, 1997) has different, pedagogical purposes, and emphasizes the notion of competence as a means of offering teachers an approach to planning and assessing. It too has a normative intention: to clarify what teachers and learners should set as their general aim, and to prescribe the components of IC which can be taught and learned within the traditions and realities of foreign-language teaching. A third group of models is that which describes or prescribes social interactions and the competences not only of “the stranger” but also of “the host.” In language-learning terms this could include what might be expected of the mother-tongue learner of the “host language and culture” as well as the foreign-language learner of the “target language and culture.” However, this is seldom if ever formulated as a pedagogical aim and reflects the assumption that it is the newcomer who should make efforts to overcome linguistic and all other demands of interaction. The commonly cited “When in Rome, do as the Romans do,” though apparently

2 INTERCULTURAL COMPETENCE

harmless, implies that the onus for change is on the newcomer, that Romans themselves need not change nor welcome newcomers and what they might bring to the enrichment of the life of Rome.

Models are useful to identify the elements which make up the complexity of IC, although models also inevitably simplify in order to do this. There are many elements, which have differing significance in differing contexts and applications, and there is a danger that lists of the kind presented by Spitzberg and Changnon (2009, pp. 36–43) simply include everything which is desirable in any human interaction, thus becoming useless in practice. Models emphasize some elements over others according to their disciplinary origins and purposes. Some focus on psychological traits necessary for a successful sojourn and how these might be managed by the individual or those who are in some sense in charge of them. Others focus on capturing the factors in the environment which impact on the sojourner and the host and how these might be reconciled. Others again specify the competences a sojourner needs to acquire in order to cope with a new environment. Few, surprisingly, include linguistic competence even though many implicitly refer to the need for successful communication skills, but, as Kramsch and Whiteside (2008) have argued, people need not only communicative competence in a language but symbolic competence and an understanding of the power relations involved in linguistic communication.

Contexts and Applications

A need for IC may arise in many situations. It is normally assumed that another “culture” is involved, that an individual will need to conduct business, study, or simply live for a shorter or longer period—perhaps for the rest of their life—in an environment which is “strange.” Furthermore it is usually assumed that this new experience will include an unfamiliar language. Such situations can arise within a foreign country or one’s own. Even though the former case is the usual focus, mobility within one’s own country can involve all the dimensions of mobility to another country, including experiencing a new language.

Mobility to another country often brings the additional factor of a significantly different set of values. Most important among these because they are fundamental to any kind of adjustment or adaptation are the understandings of the relationships of the individual to social groups and to other individuals. Models and approaches to IC have hitherto largely been constructed on the values, relationships and behaviors considered normal and taken for granted in a European tradition, whether in Europe itself or in North America. This ignores the variations between, say, social relationships in the south of Italy and the north of Norway—or even the north of Italy—but greater differences are identified when the traditions of other continents are examined (e.g., Nwosu, 2009). Models of IC in other continents remain to be developed and the consequences for modeling intercultural interactions across continents—thus far modeled only in a European framework—will have radical effects on the field.

Although a different language is expected to be a central dimension of mobility, the inclusion of language experience of a new environment is not often thematized in models of IC, whatever their origin. This is notably the case in psychological and sociological models where the time and effort required for language learning are not appreciated, but it is also problematic in pedagogical models. In pedagogy, Risager (2007) has documented the long tradition of the role of culture in language teaching, but she also shows that the relationship between “language” and “culture,” between “language” and “thought,” has been left obscure. The essential factor in teaching and learning which can clarify these relationships for pedagogical purposes is the notion of “awareness,” both cultural awareness and language awareness. Reflection on language and culture as part of the learning

process will allow learners to see the complexity of the language–culture nexus as summarized most effectively by Risager (2006).

Although psychological and sociological models have arisen from the need to analyze and prepare people for mobility, pedagogical models may include other purposes too. Teaching for intercultural competence in the institutions of a society's education system should include general educational aims: the development of the individual's values, personality, and capacity for social relations. Curricular aims for language teaching focus on understanding of otherness irrespective of the present or future usefulness of IC for mobility. This can be seen for example in the English-language curriculum for China 2001 or in proposals for "intercultural communicative language teaching" in New Zealand.

Assessment or Measuring of Intercultural Competence

The assessment of an individual's actual or potential IC may be crucial in a number of contexts. In business and commerce, the IC of managers in international companies is crucial, whether they are working in their home environment with people from other countries, or sent by their company to work in a branch in another country. In such cases batteries of tests and activities can be used (e.g., INCA, www.incaproject.org).

In pedagogical contexts, if IC is posited as an outcome of foreign-language teaching, there is a need to assess that outcome in individuals' learning or in the evaluation of the teaching program as a whole. Assessment and evaluation can be carried out with the use of psychological tests in pedagogical as in business contexts and lists of such tests are available (e.g., Fantini, 2009). The use of such tests in pedagogical contexts for examination purposes is, however, an underdeveloped research area, where questions of feasibility and ethics are likely to be crucial (Nold, 2009).

Self-assessment is another option which may also encourage autonomous learning but must be tailored to the psychological development of learners as exemplified in the "Autobiography of Intercultural Encounters," a suite of materials for teachers and learners (see www.coe.int/lang).

Intercultural Discourse

SUZIE WONG SCOLLON

Guy has ordered a goose for the Thanksgiving dinner we agreed to share. He and Cecilia enjoyed a roast goose at our home some years ago and he had asked for and followed our recipe with great success. He sends an e-mail asking whether I can eat mashed potatoes and gravy. I reply that since we never served that with goose, which was roasted Cantonese style, it would never occur to me. To which he replied that he had been filling in the menu according to his North American habits and assumptions.

The presence of Cantonese style roast goose in a Thanksgiving dinner is a bit of intercultural discourse. My husband Ron and I served it several times, first in Fairbanks, Alaska, then in Haines, then in Washington, DC where Guy and Cecilia live. In their experience, the savor of roast goose was most salient. When they obtained the recipe by phone years later, they simply put it in the slot formerly filled by roast turkey.

Key notions in this entry are discourse analysis, mediated discourse analysis, semiotic aggregate, and nexus analysis. To explicate the text of a simple e-mail exchange, reduced here to the essence, I will need nexus analysis, the methodological arm of mediated discourse analysis, which examines the role of discourse in taking action.

In an article "Intercultural Communication as Nexus Analysis," Ron analyzed a breakfast we once made of tea and bannocks (Scollon, 2002). He argued that only by opening the circumference of the making of breakfast could anything intercultural be uncovered. I will treat intercultural discourse as semiotic aggregates or actors taking action using discourses as means for mediating action. In taking action, some elements of a semiotic aggregate are foregrounded or attended to, while others are backgrounded or ignored. In replying to Guy's e-mail, I ignored everything around me, focusing on the words on the screen.

Guy: I bought the goose. Can you eat mashed potatoes and gravy?

Suzie: I can eat mashed potatoes but have never had them with roast goose.

The exchange does not meet any of the three assumptions Ron contended saturates most 20th-century thinking about intercultural communication (Scollon, 2002, p. 3):

Interculturality is to be found in spoken discourse.

Miscommunications are the test.

A priori definitions such as race are made.

To find spoken discourse, we must expand the circumference of the analysis in time and space. A relevant phone conversation with Guy and Cecilia took place some six months before, when we agreed to spend Thanksgiving together and roast a goose for dinner. There was no miscommunication as we were able to reconcile our different underlying assumptions embodied in our historical bodies. Race is not salient in the interaction, though Guy is Anglo-American, Cecilia is Mexican, and I am Chinese American.

Discourse Analysis

Intercultural discourse analysis evolved out of early work in discourse analysis focusing on the analysis and interpretation of texts on one hand and critical sociocultural, sociological, or historical analysis of orders of discourse or discursive formations on the other (Scollon & Scollon, 2001). An early use of the phrase was concerned with the construction of identity in intercultural discourse (R. Scollon, 1995). The author suggests that traditional objections to plagiarism reflect an ideological position, established during the European Enlightenment, which privileges a concept of the autonomous individual person distinct to that period of history but uncritically accepted in contemporary legal and educational circles.

A textbook *Intercultural Communication: A Discourse Approach* had the title "Interdiscourse Communication" in the contract but was unilaterally retitled by the publisher. The use of "interdiscourse" was intended to highlight the distinct discourse systems of gender and profession which can be more systematically specified than "culture."

Similarly, an earlier paper "Sex Differences in Intercultural Discourse: An Empirical Analysis" was classified as "intercultural communication" (Schneider & Jordan, 1980) for want of a general category called "Intercultural Discourse."

The word "culture" is problematic in that we tend to see culture as the description of exotic behavior by distant people, while what *we* do is regarded as normal. Thus plagiarism is regarded as something *they* do out of ignorance or perversity. Intercultural discourse analysis looks at what occurs when participants from different cultural backgrounds join together to accomplish a task, whether short-term such as having a meal or boarding a ferry or working on a team that meets monthly over the course of a year to make recommendations for educational policy. Koole and ten Thije (2001) examined how a team of Dutch and Surinamese educational specialists, all speaking Dutch, constructed a common ground of word meanings.

The concept of "discourse systems" works as a strong antidote to the tendency to reify cultures and engage in overgeneralization and oversimplification, which is evident in so much that goes under the rubric of "intercultural communication." Rather than a set of reified categories, culture is seen as an ongoing process of construction and negotiation among individuals. The notion of "interdiscourse communication" allows more inclusive focus on an entire range of communication across boundaries of groups or discourse systems.

As Silverstein (2005) observes, the ethnography of speaking highlighting the pragmatics of language in use constituted an anthropology of praxis in which "cultures" and discourse can be seen as the process of names of particular languages and cultures being appropriated and assimilated into global, transnational, "nation-statist," regional, and local projects.

Mediated Discourse Analysis

Mediated discourse analysis grew out of anthropological linguistics, new literacy studies, critical discourse analysis, sociocultural psychology, all fields which dealt with "culture" in one form or another. The fundamental principle of mediated discourse analysis is that actions such as obtaining a boarding pass or serving a meal are more central than discourse whether spoken or written. Specimens of discourse such as passports, tickets, recipes, e-mail exchanges, or conversation are treated as means with which to mediate action. The unit of analysis is the actor and means together.

Nexus analysis is the historical and ethnographic aspect of mediated discourse analysis (Scollon, 2008, p. 22). It can "make visible the sociocultural, political, historical, or

ideological sources of action in the present for both the participants and the analyst" (Scollon, 2002, p. 15).

Semiotic Aggregates

Semiotic aggregates are "very complex systems of the interaction of multiple semiotic systems" which enable human action (Scollon & Scollon, 2003, p. xii). As an example of nexus analysis (Scollon & Scollon, 2004), I will extend the timescale as well as the places on earth by which this dinner is viewed, and then show how these distant elements form and interact with historical bodies. The dishes assembled for this dinner were placed there as a result of the interaction of the primary semiotic system of Thanksgiving Day which began in the autumn of 1621 with various historical and contemporary systems of food distribution, preparation, and consumption with origins in Europe, America, and south China.

A Thanksgiving dinner is part of a semiotic aggregate of which roast turkey has been central since the mid-19th century in New England. Cranberry sauce, stuffing, gravy, mashed potatoes, rolls, and pumpkin pie have been included since the 20th century. Ron's family, the Scollons, included rutabaga puree and spiced butternut squash.

Though there now exist diverse aggregates of Thanksgiving dinner, for our purposes we can simply say that we reconciled two and enjoyed a meal none of us had eaten before but all found delectable. In the planning of the menu for this Thanksgiving dinner, while the roast goose recipe has been in the Wong family for generations, the fact that Cecilia is Mexican is not relevant.

The discourse relevant to the preparation of the meal begins with a recipe first published by Gail Wong in 1953, in the second edition of *From Hawaii: Authentic—Original Chinese Recipes*, printed in 1966 and presented to me by my father. We first used the recipe in 1980. Some two decades later we prepared roast goose and served it to Cecilia and Guy. In late 2008, the recipe was relayed to Guy over the phone and they served a goose on Christmas Eve.

Then there was the e-mail exchange, followed by Guy and myself shopping together for the constituents of the meal, discussing as we shopped. I told him about Ron's sister Dorothy's butternut squash and selected sour apples for the Alsatian apple tart I fixed. We prepared kale according to a method learned from a colleague from Dalmatia. Guy found a recipe for butternut squash on the Internet. Asparagus was on the menu, and while I do not recall having had asparagus on Thanksgiving, it was part of the meal served to the Civilian Conservation Corps in 1935 (Wikipedia). With these vegetables we also served a mixture of basmati and wild rice.

The roast goose recipe traveled with us from Honolulu to Alaska to Washington, DC, back to Alaska then to Seattle. The recipe for Alsatian apple tart started in a book we ordered when we ran a bookstore in Haines, went to Hong Kong, DC, back to Haines then to Seattle. I have e-mailed it here and there and know it by heart. The recipes for Dalmatian kale and Dorothy's butternut squash are also part of my historical body. A thoroughly American meal prepared with one imported sauce was a semiotic aggregate assembled from materials grown in North America, from methods originating in southern China and Europe, carrying among its components a history of immigration.

Social interactions on my part involved dozens of people over the course of more than half a century beginning when I fed geese in the back yard and first ate roast goose on a New Year's Eve. As a semiotic aggregate, the meal integrated semiotic systems of dining, shopping, cooking, telephone conversation, e-mail, published recipes, transportation, and agriculture, to mention a few. By extending the timescale by which we view this one meal,

we see complex discourses carried across time and space in texts, material practices, and historical bodies of participants.

Intercultural Discourse as Nexus Analysis

Several days after Thanksgiving I sit down to lunch with the mother and sister of a friend who has gone to work. Lunch is leftover turkey soup, a dish of sautéed greens, rice for me and Chinese bread for the others. The sister has never eaten turkey before and remarks that it is “*nan chi*,” ‘difficult to eat’. The mother complains it has no flavor. When a dollop of ketchup fails to make it palatable, she complains that it still has no taste.

What makes this an instance of intercultural discourse? I was not addressed but was a bystander who agreed completely with their assessment of the delectability of the turkey. We were all guests who felt obliged not to waste food that was not spoiled but simply tasteless. I think we all wished the turkey had not been purchased and roasted then boiled in unsalted water and left in large quantities for a small household, a family of five including the visitors from Guangdong, China.

The members of the family were all born in China. They speak to each other in Putonghua. They eat similar food, but the homeowners who have lived in Virginia for three decades have adopted some American practices. They add very little salt to their food for health reasons. The mother and sister who live in China, on the other hand, continue to eat food with comparatively heavy doses of salt.

Differences in food habits developed during three decades in which the hosts earned advanced degrees and worked for the US government in Virginia. Their habitus or historical bodies diverged from the ones who stayed in China. Yet it is not a simple matter of American versus Chinese, as the hosts still identify as Chinese, speak Putonghua and cook Chinese food for the most part, albeit with less salt than is used in China.

The meal of turkey, greens, rice, and bread can be seen as a semiotic aggregate in which semiotic systems of Chinese and North American prandial practices interact to enable three women to eat lunch. It was intercultural largely in its constituents. The spoken discourse was largely comprehensible to me and there was no significant difference in language, culture, race, or ethnicity. Though I am American and they are Chinese, I spoke little and there was no apparent misunderstanding. Only by extending the timescale do we consider differences between American and Chinese ways of eating illuminated by trajectories of different participants and foods.

A nexus analysis would point up the ideological nature of inquiry motivated by activist interest in change. Its goal is to discover points of change and transformation that will allow new and more effective nexus of practice. Turkeys bred for copious amounts of breast meat, artificially inseminated so they can reproduce, cooped up in environmentally polluting concrete boxes, are hardly expected to be flavorful. As a nexus analyst I would hope to bring about change in the production and consumption of such denatured fowl.

As we have seen, with a wide enough perspective, intercultural discourse is as widespread among family members who share language and “culture” as anywhere else. Two sisters grow up with the same parents, brothers, sisters, aunts, and uncles, living in a boat, speaking Tlingit until they go to school, and live on land in a tent and later a house. As octogenarians they live on the family property, each with her own house and husband. They speak to each other in a mixture of Tlingit and English.

Their father played Hawaiian music on a slack key guitar and learned to count in Cantonese and eat soy sauce and rice, a legacy of life on the Pacific Rim the sisters continue to enjoy. They both teach Tlingit at the nearby university. Yet, religious differences that have intensified in the latter half of their lives constitute cultural barriers that make traditional

ceremonies uncomfortable. The birthday party of the sisters' mother was a semiotic aggregate of fundamentalist Christian testimony and prayer, Hawaiian music and dance, Tlingit food, and contemporary American pop music, desserts, and soda pop.

Opening up the circumference of a family celebration of birth or death would make visible the trajectory of the sisters' parents through residential school thousands of kilometers away, forced use of English, alcoholism, poverty, compulsory schooling for the sisters and their siblings, and conversion to Christian fundamentalism. In short, the whole history of Russian and American colonization of their homeland would come into the picture.

Bureaucratic Security

Mina and Suzie are at a ferry terminal on Haida Gwaai intending to board a ferry to Prince Rupert, British Columbia, scheduled to depart in a few hours. Suzie presents her passport and obtains a boarding pass. Mina, seated some ten meters from the ticket counter and too drunk to walk, gets Suzie to take her passport to the ticket agent.

TA: You have to bring your passport yourself.

M gets up and staggers to the counter.

TA: For your own safety I cannot let you board.

M (outraged): I have to catch a plane back to India tomorrow!

TA: We cannot allow you to board.

M: Can I talk to your supervisor?

TA: I AM the supervisor. You can get on the ferry tomorrow night and get the train the next morning. If we tell them you're on board they'll wait for you.

M: I'm going tonight. Can you call the captain?

TA: He's busy. If you try to board I'll have to call the RCMP.

S to M: I'll wait for you at the train terminal.

At a very superficial level, we can guess from this abbreviated transcript that Mina is Indian and that *prima facie* makes this an instance of intercultural discourse. However, the supervisor who is a First Nations Canadian probably does not see herself as discriminating against an Asian Indian. From her perspective, a drunk is a drunk, Indian or not. Mina herself, though she vociferously protested being denied passage, realized the next day how outrageous her behavior had been and apologized.

Of the three assumptions regarding intercultural communication, there is spoken discourse and racial difference, but there is no overt miscommunication. Rather, the communication is very clear. It becomes a matter of who has the authority to enforce her action. With the weight of the RCMP against her, Mina has no recourse but to protest.

The ferry terminal is a semiotic aggregate of semiotic systems of homeland security as well as safety and accountability interacting with semiotic systems of ticketing and monitoring of alcohol consumption as well as selling food and beverages.

Stepping back in time and across the globe in space, we can see that many drunk passengers have boarded ferries and the great majority have arrived without mishap at their destination, though many ferries have sunk and many passengers drowned. A nexus analysis might uncover a recent ferry sinking and stricter identification of passengers following terrorist attacks in 2001. Across the Pacific in Asia, however, ferries sink from overloading. An activist might wish to change what might seem like the over-bureaucratization of public transport.

Mina may have been displaying an attitude of personal freedom developed during her days as a college student during the hippie era. Also at play might be a practice of

interdependence, with servants and family at home in India. In fact, I was instrumental in maintaining her codependency, having provided the rum. Drunk or not, it might seem natural to her to have someone else take her passport to the ticket counter. She may have been counting on me to get her safely on board, and on the ferry to arrive without mishap while she slept it off. In India, she said, ferries were often crowded to overflowing with inebriated passengers. However, the ticket agent uncritically acting as an enlightened modern person assumed that each passenger should be able to walk unaided, though there were passengers in wheelchairs, and would not consider two of us as a unit capable of safely boarding.

Conclusion

Two of the above examples have shown that intercultural discourse is as widespread among family members as anywhere else, even when they speak the same languages. With an MDA focus on concrete actions taken by social actors in real time, intercultural discourse can sometimes be detected only with nexus analysis, widening the circumference in time and space, with the goal of disrupting and making visible a priori settings such as Mexican, Chinese, or Indian.

Central to nexus analysis are the historical body, discourses in place, and interaction order, at the nexus of which is a social action. Also important is the semiotic aggregate, an interaction of complex systems which by foregrounding and backgrounding enable human action.

An MDA would shift the focus from the discourse to the action being taken. Then a nexus analysis would examine those actions for the role of discourse in their production. As a kind of discourse analysis it can make visible the sociocultural, political, historical, or ideological sources of action in the present for both participants and analyst.

Intercultural Learning

ADELHEID HU

Intercultural Learning and Intercultural Competence

Along with the important objective of communicative competence in foreign-language learning, intercultural learning has been emphasized, especially since the 1980s, as a main objective of foreign and second language pedagogy (Bredella & Christ, 1995; Hu & Byram, 2009a). Some approaches consider the two as complementary—Byram (1997) refers to “intercultural communicative competence” when he stresses the meaning of complementarity, and refers to Hymes’s early ways of describing the notion of communicative competence. The strong link between language and culture has often been stressed (e.g., Kramsch, 1998). Affective aspects like prejudices, the importance of willingness to engage with others (Byram, 1997), and the role of preexisting linguistic and cultural knowledge, on the basis of which learners acquire new knowledge—often conceptualized in terms of schema and script theories (Schank & Abelson, 1977)—have become increasingly important for research on language and cultural learning. Relativization and decentring from an often unconscious cultural imprint and understanding cultural otherness have been conceptualized as learning goals and objectives. Zarate’s notion of “le regard croisé” (Zarate, 2003) or “to see ourselves as others see us” also helped to implement the concept of decentration. Intercultural understanding and empathy in particular have been thoroughly discussed in the context of foreign-language learning (Bredella, 1992; Hu, 1998; Harden & Witte, 2000).

Concurrently, competence orientation in education systems in general and language teaching and learning in particular became one of the most important developments in Europe. In this respect, the Common European Framework of Reference is a milestone for the development of foreign-language teaching (Council of Europe, 2001). The impact of this document throughout Europe was attested by survey and it has been widely translated both in Europe and beyond. A particularly relevant point was the formulation of levels of partial competences and the general orientation of foreign-language teaching toward output and outcomes instead of, as in the past, toward input and content. In this new context, the earlier theoretical work on intercultural learning and understanding shifted more to the question of intercultural *competence*—a term that in the Anglophone context as well as in the field of business communication had already been widely used for a while (Byram, 1997; Glaser, Guilherme, Mendez Garcia, & Mughan, 2007). In this development, the concept of intercultural competence becomes—on the curricular and normative level—an important goal. Nonetheless the concept remains as fuzzy as ever and is at risk of not being realized in concrete ways in curricula or having a substantial role in language teaching because of the simultaneously developing pressure for visible and measurable realizations of competences. Zydatiss describes the dilemma as follows:

The question is, whether language teaching as a whole should fundamentally reject this outcomes-orientated thinking, at least in certain parts—for example in the teaching of literature or in the content dimension of intercultural learning—or whether, in its own interest, it would better be actively involved in this process (for example in order not to be completely ejected from the curriculum). . . . If literature teaching and the teaching of

2 INTERCULTURAL LEARNING

intercultural learning want to link their aims to foreign language teaching, they must engage actively with the conceptualization and validation of test tasks or at least make their demands clear vis-à-vis the education policy in this respect. (2006, pp. 258–9, my translation)

The pressure is tremendous, and schools, teachers, and theorists are well advised to find practical operationalizations for teaching and learning as quickly as possible and to present applicable models—especially for the assessment of intercultural competence. In fact, this has already led to significant attempts to develop exercises in intercultural competence (see for example Huber-Kriegler, Lázár, & Strange, 2003) and to propose levels of intercultural competence (Béacco, 2004; see INCA Project at www.incaproject.org). Nonetheless, the problem remains that the assumed developmental stages of intercultural competence are not empirically founded and that they are presented in universalist terms, in other words independently of context and age of learners. Furthermore, these approaches use existing concepts of “culture,” “difference,” “identity,” and “interculturality,” which from a cultural studies perspective are questionable. What is presented under the key word “intercultural competence”—not least in education policy position papers—is often an agglomeration of everyday concepts and attitudes which are put aside in scientific research on these issues. There is a mismatch and, in part, a contradiction between theory building in cultural studies on the one hand and intercultural positions focused on practical applications on the other. At the same time it is evident that cultural theory seldom provides concrete starting points for empirical research design or the development of teaching in practice. The challenge in the development of empirical research designs and exercises for teaching and learning is therefore not to fall short of the established theoretical and empirical knowledge base.

Despite these current tendencies (for a thorough discussion of the assessment of intercultural competence, see Hu & Byram, 2009b), this entry will focus on some hermeneutical aspects of intercultural learning, namely the problem of understanding cultural otherness (“Fremdverstehen”; “savoir comprendre”) and the concept of culture itself with its epistemological consequences for intercultural learning. The entry will conclude with some remarks about the current challenges for research, in the field of both intercultural learning and intercultural competence.

Understanding Cultural Otherness: An Essential Part of Intercultural Learning

In the context of intercultural learning, understanding plays an important role. The circle of researchers around Herbert Christ and Lothar Bredella in particular has reflected on intercultural understanding in the context of foreign-language learning, namely the problem of the oversimplification of foreign-language learning in the course of the communicative turn in foreign-language teaching:

Lately, communicative teaching has repeatedly been accused of oversimplifying the meaning of communication. The accusation is justified in view of the fact that the communication targeted in foreign language teaching barely encouraged the learner to query what the other intended and meant by his utterance. Thus, it did not trigger any interpretation process through which the learner could activate and jeopardize his world knowledge and his moral concept. It is only when the act of interpretation is centered that it becomes evident that understanding is a dynamic and risky educational process that has repercussions on self-understanding and one’s own world-view. (Bredella & Christ, 1995, p. 10, my translation)

Thus, understanding is not perceived as mere “rule-governed decoding” (p. 10), but rather as a creative act which can lead to identity changes.

However, the core problem of intercultural understanding remains the following: How can one understand otherness without reducing it to one’s own understanding? To what extent is understanding linked to the preconception of the understanding person and, in that sense, not capable of allowing unconditional understanding of the other? To what extent is understanding even a mere act of projection that amplifies ethnocentric views instead of overcoming them? (See Bredella, 1994, pp. 21–3; for a very fundamental debate on this issue from a hermeneutical–philosophical perspective, see Kögler, 1992). While some questioned understanding as a didactical concept (see, e.g., Hunfeld, 1993), others, Bredella in particular, advocated until recently (see Bredella, 2007) a concept of understanding that goes beyond such an appropriation. From their point of view, understanding otherness is an interplay between an inside and an outside perspective as a “dynamic and infinite educational process that has repercussions on self-understanding and one’s own worldview” (“dynamischen unabschließbaren Bildungsprozess mit Rückwirkung auf das eigene Selbst- und Weltverständnis”; Bredella, 2007, p. 11).

Intercultural Learning as a Change of Perspectives

One basic assumption is that the understanding process oscillates between two perspectives: an embraced “emic (inner) perspective” and an “etic (outside) perspective.” Emic perspective means that the other’s culture should be understood from the inside. In other words, it is an attempt to see the other’s culture through the eyes of the members of that same culture. This involves temporarily suspending one’s own values, norms, and behavior patterns and practically “immersing” oneself in the other culture. By contrast, adopting an outside perspective means that the other’s culture is always seen through one’s own eyes and understood based on one’s unavoidable preconceptions. This implies that one does not absolutely assimilate the other culture but learns to interpret the phenomena from a critical and distant attitude. According to Bredella and Christ, the interplay and the interlocking of those perspectives generate a productive understanding of otherness that is characterized by empathy as well as by critical reflection.

In his 2007 article, Bredella differentiates the idea of outside perspective even more by distinguishing between outside perspective I and II. Outside perspective I refers to the understanding of phenomena pertaining to a foreign culture on the basis of one’s own preconception. Outside perspective II occurs when outside perspective I is modified by the attempt to adopt the inside perspective:

Then [by adopting the outside perspective I], we however find out that we have to learn to suspend our perceptions and opinions and develop an inside perspective that will allow us to see the otherness as being different from oneself. That way we learn that the foreign language and the foreign culture not only constitute a distorted form of our own language and culture but that they also follow their own laws of logic. That does not mean that our perceptions and opinions have disappeared, they come back into play on a reflected level that hence comprehends also the other’s opinions and views, I shall call it the outside perspective II. (Bredella, 2007, p. 24, my translation)

When one adopts the outside perspective II, this means not only that an alignment with one’s own preconception has occurred but, even more, that a third space can develop that transcends otherness and oneself. The outside perspective II expresses the idea that the understanding process always starts from one’s own reference point—even when adopting the inside perspective—but that one’s horizon can be expanded and a third space can even emerge.

Intercultural Learning and the Concept of Culture

Since the 1990s, a deconstruction of essentialist concepts of culture has been observed in culture studies and cognate disciplines. There is a broad consensus that cultures are never independent of the observer's perspective. Even though it still prevails in regular theories today, the longtime prevalent concept of cultures as being coherent and delimitable entities is considered obsolete. Instead, a discursive reflexive concept of culture that has the property of creating meaning is now being embraced: "Culture seems to be a process of progressive reflexive semantization through which resources for meaning are constantly being created and distributed but at the same time can be subverted and destroyed" (Böhme, 2000, p. 356, my translation). Thus, culture and language are indivisible. Göller relates this explicitly to the phenomenon of intercultural communication:

Human creation of meaning, intracultural and intercultural communication and interaction as well as reference to self, to the other and to the world—in other words, the human cultural assignment of meaning per se—is primarily bound to language, it is conveyed through language. This is valid for all forms of intracultural and intercultural exchange. . . . Language and culture are very closely entwined. (Göller, 2000, pp. 330–3, my translation)

Simultaneously, beside this epistemological change of perspective, the accent is not laid on the collective consensus anymore; instead, disparities, antagonism, syncretism, hybridity, idiosyncratic patterns of meaning and processing take center stage. Culture is not considered anymore as the "integrative adhesive" ("integrativer Kitt") of society (Hörning & Winter, 1999, p. 8). On the contrary, the objective of reflexive critical work is now to debunk cultural homogeneity as an orchestration (for more on new metaphors in the description of cultural phenomena, see Hu, 2005). Eventually, the "category of power" has also gained in importance for cultural issues. Wägenbaur for example refers to objectifying and essentializing culture concepts in particular as "metaphorical-metonymical means of enforcing power interests" (Wägenbaur, 1995, p. 23).

This new view of culture also has an impact on intercultural learning and intercultural communication: it is a challenge for traditional positions, which seem to prevail unquestioned especially in foreign-language didactics (see Risager, 1998). The discourse taking place in the interaction becomes more important than the "category of origin": intercultural communication and intercultural learning occur when interlocutors have exchanges about cultural plans, demarcations, values, or norms, when they argue, or when they position themselves within one of those norms. Hence, in that sense, intercultural communication can definitely also occur between speakers of the same language or the same country. It is understandable—but not self-evident—that interlocutors who hail from different and distant world regions and who speak different native languages would rather come to speak about cultural themes as mentioned above (see Hu, 1999, pp. 297–8).

For intercultural learning, these developments in culture theory definitely represent a challenge. The issue of interculturality and the concept of foreign culture have been deprived of their matter-of-factness and, in the course of time, examined more closely (see for example, the recent discussion on "transcultural learning" and "intercultural learning" in Bredella, 2010, pp. 126–45).

Current Challenges for Research on Intercultural Learning and Intercultural Competence in Language Pedagogy

Current research focuses particularly on the following matters: how to empirically reconstruct intercultural learning processes in the context of foreign-language teaching, how

developments in this context can be represented, and which tools allow the measurement of intercultural competences. Currently, there are different approaches: While researchers of the DESI study group have actually tried to evaluate intercultural competences by means of pedagogical psychology (see Hesse, Göbel, & Jude, 2008), others have been opposing that procedure and advocate “softer” evaluation forms such as self-reflexion (see Byram, 2009, and the “Autobiography of Intercultural Encounters” presented there). The current state of research is marked by a trend toward interdisciplinarity and an internationalization of the matter. By way of example, Hu and Byram (2009a) have reflected on the different approaches of cultural studies, pedagogical psychology, and developmental psychology. Unresolved questions are, for instance:

- How does subjective knowledge about the cultural basis of traditions, norms, and modes of behavior develop?
- When and how do children learn that culture affects human thinking and behavior, and what role does the learning of another language play in this?
- How does children’s and young people’s understanding of ethnic and national belonging develop and how do stereotypes and prejudices develop?
- What types of studies of intercultural competence can learners undertake at specific ages and stages of cognitive development?
- Which research approaches can enable the reconstruction of cultural learning processes (interviews, discourse analysis, video recording of lessons, etc.)?
- What is characteristic of “cultural learning processes” (changes of patterns of interpretation, self-relativization, capacity for empathy, attempts at change of perspective)?
- What is the relationship between cultural and foreign-language learning?
- Which curricular aims are appropriate for which age groups?
- Which scientifically validated methods can allow the measurement and evaluation of intercultural competence?

In spite of varying premises of research, interdisciplinarity is indispensable for further development within this field. At the same time, it is important for the practice of teaching to develop exercises that systematically foster intercultural competences and make them evaluable (see Caspari & Schinschke, 2009).

Intercultural Rhetoric in Language for Specific Purposes

ANA I. MORENO

Introduction

Intercultural rhetoric (IR) is a research field that seeks to identify and explain some of the rhetorical and stylistic accommodations that multilingual writers need to make in order to achieve their communication goals *interculturally*. It is this concern with rhetorical and stylistic accommodations that distinguishes IR studies from other contrastive studies more concerned with potential transfer at lexicogrammatical levels. IR in language for specific purposes (LSP) is a branch of IR which restricts its research concern to texts written by academic and professional writers. It offers a framework for investigating hypotheses about cross-cultural differences in LSP rhetoric and style, that is, contrastive rhetoric (CR) hypotheses, which may explain some of the revisions that multilingual writers need to make in order for their texts to be successful across cultures. Most IR research has focused on multilingual writers communicating in English, mainly because of the special attention given to writing instruction in US universities over the past half-century and of the dominance of English as an international code of communication (Atkinson & Connor, 2008). IR in LSP rests on the premise that when multilingual writers produce texts in English they are likely to transfer rhetorical and stylistic features typical of related LSP texts written in the language and writing culture into which they have been socialized.

These types of hypotheses have been substantiated since the late 1980s by empirical observations of differences in the preferred rhetorical patterns and stylistic features of specialized texts written in English as a first language (L1) and in languages other than English as L1s as well (e.g., Spanish, Chinese, French, Polish, Portuguese, Italian, Ukrainian, Russian, German, Bulgarian, Japanese, Arabic, Slovene, Czech; see “Suggested Readings” for some examples). Given its ultimate aim to apply results to language teaching and learning in ESP classrooms, IR research in LSP is not so much interested in comparing individual writing styles as in comparing recurrent tendencies in rhetoric and style, as well as in writing processes and practices across cultures (e.g., Alvarez Angulo & García Parejo, 2010). As is often claimed, being aware of such differences in rhetoric and style may be helpful to multilingual writers in ESP because making nonstandard choices in these respects may create effects of rhetorical and interpersonal inefficiency with important practical consequences for them, such as the greater need to revise their texts.

From CR to IR

The contrastive rhetoric (CR) hypothesis was first launched by Robert Kaplan in his 1966 seminal paper, based on the analysis of a large sample of essays written in English as a second language (L2) by multilingual students at an American university. Since then, various developments have taken place, helping IR to consolidate as a research field in its own right within applied linguistics (AL). On the one hand, the field has expanded its

scope by studying a larger variety of features and genres in LSP as used by expert writers (see below), as well as student writers. It has also broadened its framework by incorporating the study of hypotheses about the accommodation that takes place in settings where English is used as a lingua franca, where none of the participants are native speakers of English (Connor, 1999). On the other hand, it has improved and expanded its methods by employing increasingly rigorous and sophisticated research designs (see below) and by paying greater attention to the sociocultural contexts of the genres and the writing practices in the cultures under comparison (see below) in order to research the CR hypothesis. Given the present broader scope of CR, Ulla Connor, a leader in the field, has suggested adopting the term “IR” to highlight its current state (Connor, 2004). This term has been accepted and is now being built upon.

Influences and Recent Developments

As with many other fields in applied linguistics, IR research in LSP has developed in parallel with advances in many related research traditions and methods, such as genre analysis, (critical) discourse analysis, pragmatics, contrastive analysis, translation, composition studies, corpus linguistics, statistics and ethnographic methods. For instance, scholars’ inspiration has often been drawn from genre analytic frameworks employed in describing written LSP texts as exemplars of situated genres, or classes of communicative events (Swales, 2004). The field has also developed in parallel with advances in ESP pedagogy, such as those involved in task-based and genre-based language teaching approaches.

Rhetorical and Stylistic Features Compared

IR research in LSP has continued investigating writers’ preferred ways of organizing ideational meaning. Thus many studies have focused on rhetorical structures, paragraph organization, placement of topic sentences, sentence and paragraph length and complexity (coordination/subordination), thematic development, and textual metadiscourse. It has also considered the text resources involved in signaling writers’ authoritativeness, or tentativeness, and their attitude toward the ideas referenced in the text, as well as the type of relationship established with their readers. Thus more recent IR studies have focused on interpersonal metadiscourse (e.g., engagement markers, hedging and boosting devices, writers’ visibility and invisibility strategies, attribution, and other evaluation resources). A few studies have also uncovered differences in the type of ideational meaning included in LSP texts, such as the relative absence/presence of certain language functions or the type of comments that it is appropriate to make on comparable things in comparable genres.

Toward Greater Validity and Comparability

One important improvement incorporated in the field has derived from scholars’ concern with establishing increasingly valid comparisons (Connor & Moreno, 2005). To that aim, various measures have been taken in recent studies. On the one hand, cross-cultural preferences in LSP rhetoric and style have been uncovered by directly analyzing texts written by successful writers in their respective L1s. As has often been emphasized, in order to verify whether or not multilingual writers’ need for accommodation when writing in English as an international language may be related to differing writing expectations and practices in their L1s, it is essential to know exactly what these are in texts written by expert writers. The importance of matching comparable writers by considering their level of expertise, among other things, has been emphasized on various fronts (e.g., Neff, Ballesteros, Dafouz, Martínez, & Rica, 2004).

On the other hand, studies have tried to define their population of texts more carefully in order to improve the comparability of the corpora employed in analyses (Moreno, 2008). As a result, they have focused their comparisons on particular genres (e.g., research articles [RAs], RA and conference abstracts, academic book reviews, editorials and letters to the editor, grant proposals, business request letters, newspaper articles, editorials, and so on) and part-genres (e.g., the RA introduction, the method or the discussion section). For instance, in his study of 160 RA abstracts in experimental social sciences, Martín-Martín (2003, p. 25) shows that, while the English abstracts in his corpus largely follow the Anglo-American practices prevalent in international journals, consisting of Introduction, Methods, Results, and Conclusion, the Spanish abstracts show a lower tendency to include a Results unit, and to justify their work in their research field as a way of establishing a niche in their Introductions.

Some scholars have also raised the importance of comparing comparable textual concepts, such as metadiscourse or evaluation (Connor & Moreno, 2005; Moreno & Suárez, 2008), and of obtaining increasingly meaningful cross-cultural results transferable to possible ESP teaching applications. To this end, studies have started to focus their comparisons on more restricted functional text units and meaning systems within a given genre. For instance, in their intercultural study of writers' visibility and invisibility strategies, Moreno and Suárez (2011) restrict their comparison to text fragments functioning as praise and criticism of a book under review (i.e., two given language functions), construing what the books are worth (i.e., by means of the appraisal system of appreciation) in a given genre (academic book reviews) across (British and American) English and Castilian Spanish. Their results show how writers from these two groups tend to choose similar rhetorical options, but they do so to very different degrees. In particular, the preferred choice by British and American scholars is to create a textual voice for themselves that presents itself as speaking on behalf of other readers, thus creating a perspectivizing face-saving effect. By contrast, Castilian Spanish literary scholars prefer to create an objectivizing face-saving effect by speaking on behalf of an impersonal entity.

Toward Greater Representativeness and Reliability

Recent IR studies into LSP have also incorporated developments from corpus linguistics and have used statistics to achieve greater representativeness and reliability. Thus, they have tended to analyze larger samples of specialized texts. Also, in collecting comparable corpora, most studies have variously taken into account other contextual features that may also affect the content and shape of discourses (e.g., the (sub)discipline, the historical time, the specific language variety, and the specific purpose of the genre). Furthermore, a few scholars have applied statistical tests to show whether the identified differences are statistically significant or not (e.g., Salager-Meyer, Alcaraz Ariza, & Zambrano, 2003; Moreno & Suárez, 2011); and a few others have taken measures to guarantee the reliability of researchers' interpretations, for instance, by applying inter-rater reliability tests that show the degree of agreement among raters (e.g., Burgess, 2002).

Going Beyond Texts Into Contexts and Cultures

Ever-changing conceptualizations of writing as a socially constructed activity and process have also led a few researchers to employ qualitative methods in order to look beyond the texts themselves into their contexts of production and interpretation, as suggested in Connor (2004). Their main aim has been to obtain sociocultural information that may help them to explain the uncovered quantitative contrastive results, thus leaving behind the speculative suggestions made by earlier quantitative studies. For instance, Burgess, Fumero Pérez, and Díaz Galán (2006) carried out a study of successive manuscripts submitted

internationally by an established Spanish scholar in the field of educational psychology, and examined the responses given by the journal editor and peer reviewers to these drafts during a six-month revision period. They discovered that the reason why this researcher would omit establishing a niche in his RA introduction was reticence on his part to criticize earlier work in the field and to foreground his own contribution. For their part, in their study of the frequency and type of critical comments (positive/negative) in academic book reviews of literature, Moreno and Suárez (2009) interviewed the reviewers in their sample via e-mail. This study concludes that the differences identified are motivated by a different understanding about the purpose of the genre, difference in the size of the academic communities, and different editorial practices.

Conclusions

IR has become an interdisciplinary, applied, and dynamic research field. It provides validity, comparability, representativeness, reliability, explanatory power, and transferability of research findings to current ESP pedagogy. Application of cross-cultural insights into ESP in intercultural settings is expected to be seen in future ESP teaching applications. As Moreno (2010) suggests, bringing in explanatory cross-cultural results is especially suitable for pedagogical approaches with critical pragmatic orientations, that is, those that “synthesise the preoccupation with difference inherent in critical pedagogy and the preoccupation with access inherent in pragmatic pedagogy” (Harwood & Hadley, 2004, p. 366). After all, raising multilingual writers’ awareness of cross-cultural differences in LSP rhetoric and style according to audience type, as well as in writing practices and processes, will bring in more complex explanations for textual differences (see Canagarajah, 1996) and encourage more active negotiation of multiple rhetorics (see Kubota & Lehner, 2004).

Intercultural Understanding With Literary Texts and Feature Films

LOTHAR BREDELLA

Is it possible to promote intercultural understanding with literary texts and feature films? What has to be considered in answering this question? In the first section I shall outline the structure of intercultural understanding (*Fremdverstehen*). In the next section I shall discuss the ontological status of literary texts and feature films in order to decide whether they can make a claim to knowledge. Formalists assert that they are unable to do so because they are self-referential and do not refer to the outside world. I shall refute the formalist concept of art by pointing out that literary texts and feature films create models of reality and “magical mirrors” (Turner, 1988, p. 42) which allow us to see the world in a new light. Then I shall consider the process of reception since it influences the knowledge that literary texts and feature films convey. On the basis of the insights gained I shall show in the concluding section how reading literary texts and watching feature films can promote intercultural understanding.

Intercultural Understanding (*Fremdverstehen*): Taking an Inner and Outer Perspective

If we want to understand the members, values, and institutions of a foreign culture, we must step out of our own frame of reference and reconstruct that of the foreign culture with its own rules, conventions, attitudes, and values. Is such a transition from one culture to another possible? Radical relativists argue that it is not because there are no transcultural concepts which enable us to evaluate the differences without an ethnocentric bias. On the one hand, the relativists are right: there are no pre-given transcultural concepts and standards. But on the other hand, they are wrong: we can invent these in negotiations and also learn to develop empathy, which enables us to take the other's perspective. Empathy, however, does not mean that we become identical with the other. If this were the case, we would not know that we understand him or her. Nussbaum (2006, pp. 32–3) writes: “if one really had the experience of feeling the pain in one's own body, then one would precisely have failed to comprehend the pain of another *as other*.”

In understanding others we transpose ourselves into them in order to find out what it is like to see the world from their perspective. This demands that we gain a certain distance from our views, attitudes, feelings, and values, but we cannot bracket them completely because then we would no longer understand others as fellow humans. Hence Vetlesen (1994, p. 204) can write with reference to Gadamer: “Empathy thus entails a *Sichmitbringen*, not a *Sichaufgeben*” [We must *bring ourselves* and must not *disregard ourselves*]. Empathetic understanding differs from the third-person perspective which directs our attention to objective features without considering their significance for the experiencing subject in order to establish law-like connections between them (for the significance of empathy for the moral and aesthetic experience see Bredella, 2010, pp. 149–62).

The understanding of others has been explored by the Giessen postgraduate center Didaktik des Fremdverstehens (Didactics of Understanding the Foreign). Two different

perspectives are involved in *Fremdverstehen* or intercultural understanding: an inner and an outer perspective. Taking the inner perspective means that we transpose ourselves into others and attempt to see the world through their eyes because we want to understand how they see the world. Understanding also means that we take an outer perspective and see their world through our own eyes. The second-person perspective makes us respond to the others' words and actions and brings our own views and values into play. Understanding is dialogical, for understanding others cannot be separated from understanding ourselves (for the interplay of the two perspectives see Bredella, Meißner, Nünning, & Rösler, 2000; Bredella & Christ 2007; for different goals in intercultural understanding see Bredella, 2010, pp. 89–108).

When we reconstruct the frame of reference of a foreign culture we must take into account the fact that cultures are not homogeneous but heterogeneous and that they are characterized by disputes among their members regarding what is right and wrong. This implies that the others are not only shaped by their culture but also shape it in turn, and that they are creative and reflexive human beings whose individual perspectives have to be taken into account. Hence intercultural understanding presupposes not only inner and outer perspectives but also collective and individual perspectives (see Bredella, 2010, pp. 93–95, 103–5). Literary texts and feature films are well suited for making us aware of how people differ in a foreign culture. But before we can consider their significance for intercultural understanding we must deal with the objection that they cannot be relevant for intercultural understanding.

The Ontological Status of Literary Texts and Feature Films

According to formalists, poets cannot lie since literary texts are self-referential; they cannot raise a claim to knowledge nor can they tell us something about the world we live in. The formalists recognize a division of labor in modern cultures: sciences provide us with reliable knowledge; ethics explores how we should act; and aesthetics and art liberate us from the world of knowledge and ethics, enabling us to enjoy forms for their own sake. This formal concept of aesthetics makes us aware that religion, politics, and morality in modern cultures can no longer prescribe the functions art has to fulfill but it is unable to illuminate the various functions art fulfills for its recipients. And the formal concept is wrong if it assumes that it is the main function of art to make us forget the world we live in (for a discussion of the different functions of art and a critique of formalism see Bredella, 2010, pp. 33–6).

If we want to understand why the reception of literary texts and feature films is educationally significant, it is helpful to regard them as models of reality and as “magical mirrors” (Turner). Models simplify reality and direct our attention to certain features while neglecting others. Thus they enable us to become aware of new connections, which allow us to see things in a new light. This concept of art makes clear that works of art do raise a claim to knowledge although they are not obliged to adhere to documentary fidelity. Writers and directors can invent characters and actions in order to reveal something about reality. Aristotle maintained that poetry was more philosophical and more serious than history because it presented human possibilities. Two and a half thousand years later, the novelist Milan Kundera (1990, p. 42) made a similar claim: “A historian tells us about events that have taken place. By contrast, Raskolnikov’s crime never saw the light of day. . . . Novelists draw up the map of existence by discovering this or that human possibility.” Presenting possibilities and models of reality are forms of knowledge. Hence Kundera (pp. 5–6) can say: “A novel that does not discover a hitherto unknown segment of existence is immoral. Knowledge is the novel’s only morality.”

According to Turner, works of art hold a mirror up to us. They can fulfill this function because they are magical mirrors: “they exaggerate, invert, re-form, magnify, minimize, dis-color, re-color, even deliberately falsify, chronicled events” (Turner, 1988, p. 42). For example, postcolonial literary texts and feature films explore the effects of colonization on colonizers and those colonized. We would depreciate their value by saying that they are merely self-referential and are unable to reveal something about colonization and make us see it from a new perspective. We might not agree with the presented perspectives but this indicates that our views and values are addressed and that our self-concept is at stake in responding to the literary texts and feature films about colonization. Their intention is not to make us forget reality but to get involved with it. Yet this involvement is shaped by the process of reception.

The Process of Reception

What is characteristic of the situation of reception? In watching films it becomes obvious that we as spectators cannot enter the rooms on the screen and change the course of events. We can only enter them imaginatively in order to experience the significance of these events for our understanding of the world. In a similar way we create the world of literary texts in which we are only observers. For instance, we cannot tell Othello that his wife is innocent. How do we evaluate this situation of reception? In the well-known essay “The Role of the Onlooker,” Harding points out that onlookers, although they make no direct operative response, are able

to assess the event in the light of all the interests, desires, sentiments and ideals that they can relate it to; and that they feel it to be noteworthy, commonplace, agreeable or disagreeable, tragic, funny, contemptible, heroic – to mention a few of the cruder responses. (1937, p. 250)

This indicates that observing is an important activity. According to Shusterman (2002), art as dramatization means that events and actions are taken out of their ordinary contexts and presented in such a way that we as engaged onlookers can respond intensely and freely to them: “Because art’s experience is framed in a realm alleged to be apart from the wearisome stakes of what we call real life, we feel much more free and secure in giving ourselves up to the most intense and vital feelings” (Shusterman, 2002, p. 237). For Nussbaum (1990, p. 48), spectators are more circumspect: “Since the story is not ours we do not find ourselves caught up in the ‘vulgar heat’ of our personal jealousies or our angers or in the sometimes blinding violences of our loves.” For Bakhtin the literary text is not a linguistic object whose stylistic and structural features we register, but an utterance which encourages us to respond intensely with our emotions and values:

So long as we simply see or hear something, we do not yet apprehend artistic form; one must make what is seen or heard or pronounced an expression of one’s active, axiological relationship, one must enter as a creator into what is seen, heard, or pronounced. (Bakhtin, 1990, p. 305)

The situation of reception makes it possible that we are involved *and* are able to observe being involved. According to Rosenblatt, aesthetic reading means that

the reader’s selective attention is focused on *what he is living through during the reading event*. He is attending *both* to what the verbal signs designate *and* to the qualitative overtones of the ideas, feelings, images, situations, characters that he is working out under the guidance of the text. (Rosenblatt, 1981, pp. 21–2)

4 INTERCULTURAL UNDERSTANDING WITH LITERARY TEXTS

Turner stresses that spectators are in a privileged situation “where [they] are allowed to think about how they think, about the terms in which they conduct their thinking, or to feel about how they feel in daily life” (Turner, 1988, p. 102). Literary texts and feature films are important for a culture because they encourage their recipients to negotiate their self-descriptions:

No society is without some mode of metacommentary – Geertz’ illuminating phrase for a ‘story a group tells itself about itself’ or in the case of theatre, a play a society acts about itself – not only a reading of its experiences but an interpretative enactment of its experience. (1982, p. 104)

The aesthetic experience does not liberate us from the world we live in but makes us reflect on our experience of it. Hence it is educationally significant.

The formalists see an unbridgeable gulf between aesthetics and ethics. Yet the analysis of the process of reception shows that the two realms are interdependent. Ethics needs aesthetics for the development of an ethical sensibility, and aesthetics needs ethics because without it literary texts and feature films could not challenge our views and values. According to Wayne Booth, we should regard a literary text as a good friend who wants to convince us of a certain worldview. Nussbaum takes up this metaphor and develops its implications for the process of reception:

What does this new friend ask me to notice, to desire, to care about? How does he or she invite me to view my fellow human beings? Some novels, he [Booth in *The Company We Keep: An Ethics of Fiction*] argues, promote a cheap cynicism about human beings and lead us to see our fellow human beings with disdain. (1998, p. 100)

This indicates that we are ethically involved in understanding literary texts and feature films.

The Significance of Literary Texts and Feature Films for Intercultural Understanding

I pointed out in the opening section that empathy is important for intercultural understanding because it helps us to understand what it is like to be in the other’s situation and to recognize the other’s self-descriptions. It is an essential aim of literary texts and feature films to encourage us to transpose ourselves into others. We can say that there is an inherent connection between intercultural understanding and the reception of literary texts and feature films. Nussbaum (1998, p. 88) directs our attention to this inherent connection when she writes: “Narrative art has the power to make us see the lives of the different with more than a casual tourist’s interest—with involvement and sympathetic understanding.” In understanding stories we learn more about the thoughts, emotions, attitudes, and values of others than in personal encounters because writers, directors, and actors are experts in articulating these: “it is for this reason that literature is so urgently important for the citizen, as an expansion of sympathies that real life cannot cultivate sufficiently. It is the political promise of literature that it can transport us, while remaining ourselves, into the life of another, revealing similarities but also profound differences between the life and thought of that other and myself and making them comprehensible, or at least more nearly comprehensible” (Nussbaum, 1998, p. 111). Literary texts and feature films can promote intercultural understanding because they enable us to see forms of life beyond our own range.

In the essay "Redemption from Egoism" (and one could add "Redemption from Ethnocentrism") Rorty (2003, p. 9) points out that novels can make us see what appears meaningless or appalling from the outer perspective as meaningful and attractive from the inner perspective. Even if we do not approve of the others' self-descriptions, our knowledge about them makes it possible to "have a more educated, developed and sophisticated moral outlook."

We often regard members of foreign cultures as inferior and as enemies we intend to destroy because we believe that otherwise they will destroy us. In "Human Rights, Rationality, and Sentimentality," Rorty (1993) asks how we can overcome this vicious circle and bring people to see in others not enemies but fellow human beings. In his opinion, we will not succeed by pointing out to them that reason tells us that we have to respect the dignity of every human being. They will reject this argument because they cannot imagine that "membership in a biological species is supposed to suffice for membership in a moral community." They will even be

morally offended by the suggestion that they should treat someone who is not kin as if he were a brother, or a nigger as if he were white, or a queer as if he were normal, or an infidel as if she were a believer. (Rorty, 1993, p. 125)

Hence it is necessary to make them see in the other whom they despise a fellow human being. According to Rorty, stories might bring about such a change because they make their recipients transpose themselves into others so that they see the world through their eyes and experience that others suffer as they do when their children die or when they are driven out of their homes (Rorty, 1993, p. 129). Stories promote our ability "to see the similarities between ourselves and people very unlike us outweighing the differences" (p. 129). Of course, these effects will only come about if we do not regard stories as self-referential linguistic objects but as utterances "that engage us behaviorally or ideologically" (Bakhtin, in Morris, 1994, p. 33).

Interlanguage

ELAINE TARONE

Interlanguage (IL) refers to the linguistic system of learner language produced by adults when they attempt meaningful communication using a language they are in the process of learning. The construct of interlanguage was proposed by Larry Selinker in 1972, and stimulated the first research studies in the new field of second language acquisition. It continues, in modified form, to provide a useful general framework for research in that field. Here we will summarize the original formulation of the hypothesis in 1972, and then review subsequent modifications and expansions of the hypothesis.

The most fundamental claim of the interlanguage hypothesis is that the language produced by the adult learner when he or she attempts meaningful communication in a foreign language is systematic at every level: phonology, morphology, syntax, semantics, and pragmatics. The interlanguage system is fundamentally autonomous and patterned. It is not a random hodgepodge collection of unsystematic errors, but clearly, it is neither native language (NL) nor target language (TL); it is a separate transitional linguistic system that can be described in terms of evolving linguistic patterns and rules, and explained in terms of specific cognitive and sociolinguistic processes that shape it.

Another important claim is that the processes of interlanguage acquisition and use are typically unconscious and not open to introspective analysis by the learner. Indeed, the learner is typically not aware of the linguistic characteristics of the language he or she is unconsciously using, often perceiving the linguistic forms being used in IL to be “the same” as forms in both NL and TL. If learners are asked about interlanguage rules that they use in their own unrehearsed, meaningful communication, they will not be able to give an accurate account of those rules. Rather they may describe TL rules they have consciously learned in the classroom, but these are not the interlanguage rules they actually use when focused on meaning.

One of Selinker’s most controversial claims is that interlanguage always “fossilizes”—it stops developing at some point before it becomes identical with the target language system. In other words, adult second language learners never reach their goal—they can never produce the target language as accurately as someone who acquired it natively.

Origins of the Concept of Interlanguage

The general idea that the language of second language learners is an autonomous linguistic system, distinct from both NL and TL, was developed at about the same time by three scholars (see Selinker, 1992, for a detailed account). Nemser (1971) referred to learner language as an “approximative system,” and Corder (1967, 1981) called it “transitional competence.” Eventually, the term “interlanguage” (Selinker, 1972) was the one that caught on. The construct was developed in reaction to generally accepted claims by contrastive analysts such as Lado (1957) that the second language learner’s language was shaped entirely and only by the transfer of linguistic patterns from the native language. Lado had argued that because of learners’ reliance on their NL rules, a good contrastive analysis of the NL and the TL could accurately predict all the difficulties that learners would encounter in trying to learn the TL. However, there was little if any empirical evidence to support

this claim. In the late 1950s and the 1960s, there were virtually no systematic attempts to observe learner language and document the way in which learner language developed, and no data were reported which could independently and objectively verify the strong claims of the contrastive analysis hypothesis that language transfer was the sole process shaping learner language.

The chair of the Department of Applied Linguistics at Edinburgh University S. P. Corder (1967) was the first to publish the alternative hypothesis that second language learners may not begin with their system of NL rules and gradually modify those in the direction of TL. Rather, he argued that second language learners are more like first language learners, beginning with an essential, simple, probably universal grammar. In Corder's view, second language learners had a "built-in syllabus"—different from the teacher's syllabus—which could guide them in the systematic development of their own linguistic system, or "transitional competence." Calling for the empirical study of learners' errors, Corder hypothesized that researchers would find evidence—not of the wholesale transfer of NL rules but of the idiosyncratic linguistic system that learners were building. Errors would become a source of valuable data for research into the nature of the second language learner's "built-in syllabus." Applied linguists began to carry out "error-analysis" studies.

During a 1968–9 Fulbright stay at Edinburgh University where he worked with Corder and other scholars, Larry Selinker developed the construct of "interlanguage" to flesh out the view of learner language as an autonomous linguistic system, and not just a collection of errors. Published in 1972, his paper "Interlanguage" was intended to stimulate research into the structure and development of the linguistic system evidenced in the learner language spontaneously produced by adult second language learners.

Defining Interlanguage

"Interlanguage" was defined by Selinker (1972) as the separate linguistic system evidenced when adult second language learners spontaneously express meaning using a language they are in the process of learning. The linguistic system of interlanguage encompasses not just phonology, morphology, and syntax, but also lexis, pragmatics, and discourse. Interlanguage (IL) differs systematically from both the learner's native language (NL) and the target language (TL) being learned. The IL is not just a relexification of the NL morphosyntactic system—NL rules with TL vocabulary; in other words, NL transfer is not the only process that shapes IL. Just as clearly, what the learner is producing is not the TL morphosyntactic system—the IL has a distinctive and systematic set of rules that differs in describable ways from the TL rule system.

Central to the notion of interlanguage is fossilization—the tendency of the learner's interlanguage to stop developing short of the learner's goal. Fossilization was initially claimed to occur only when adults acquire a second language after puberty. Children acquiring second languages were thought to have the ability to reengage their innate capacity for language-specific acquisition (or universal grammar, UG) and thus to avoid the error pattern and ultimate fossilization which characterize the interlanguages of adult second language learners.

Selinker felt that fossilization results because adults acquiring second languages use more general cognitive processes, which he referred to as "latent psychological structure," rather than an innate language-specific UG, which he referred to as "latent language structure" (Lenneberg, 1967). He identified five cognitive processes that constitute the latent psychological structure and shape interlanguage linguistic systems: (a) native language transfer, (b) overgeneralization of target language rules, (c) transfer of training, (d) strategies of communication, and (e) strategies of learning.

Native language transfer plays a role in shaping interlanguage rules. While it is not the *only* cognitive process involved (as contrastive analysts like Lado claimed), there is ample research evidence that crosslinguistic interference does influence the development of interlanguage rules. Selinker (1972, 1992, following Weinreich, 1968, p. 7) suggests that the cognitive process underlying transfer is that learners make *interlingual identifications*: they perceive certain units as *the same* in their NL, IL, and TL. So, for example, they may perceive NL *table* as exactly the same as TL *mesa*, and develop an interlanguage in which *mesa* can (erroneously in terms of the TL) be used in expressions like “table of contents,” “table the motion,” and so on. Selinker followed Weinreich in pointing out an interesting paradox in second language acquisition: in traditional structural linguistics, units are defined in relation to the linguistic system in which they occur, and have no meaning outside that system. However, in making interlingual identifications, second language learners typically “stretch” linguistic units by perceiving them as the same in meaning across three systems. An interesting research question is, how do they do this? And what sorts of units are used in this way: linguistic units like the taxonomic phoneme or the allophone, or syllables, for example? Selinker raises questions about the ability of traditional linguistic frameworks, based as they are on assumptions of monolingualism, to handle interlanguage data in which interlingual identifications across three linguistic systems play a central role.

A second cognitive process is overgeneralization of target language rules. This is a process which is also widely observed in child language acquisition and is sometimes called a *developmental* process: the learner shows evidence of having mastered a general rule, but does not yet know all the exceptions to that rule. So, for example, the learner may use the past tense marker *-ed* for all verbs, regular and irregular alike: *walked, wanted, hugged, laughed, *drinked, *hitted, *goed*. The overgeneralization error is clear evidence of progress, in that it shows that the learner has learned the general language rule; the next step is to learn the exceptions to the rule. To the extent that second language learners make overgeneralization errors, one might argue that they are using the same process as that employed by first language learners. Many of the early stages of development in SLA, such as early stages in the acquisition of English questions, can involve the cognitive process of overgeneralization, as when learners overgeneralize SVO statement word order, thus producing stage 3 questions.

Transfer of training occurs when the second language learner applies rules learned from instructors or textbooks. Sometimes this rule application is successful, but sometimes the resulting interlanguage rule is erroneous. For example, a lesson plan or textbook that refers to the English past perfect tense as the “past past” can lead the second language learner to erroneously use the past perfect for events in the absolute distant past (all events which occurred long ago) without relating these to any more recent past event or time frame, as in the isolated statement, “My relatives had come from Italy in the 1800s.” Another example is the use of overly formal classroom expressions in conversations with peers outside the classroom. Such errors resulting from transfer of training have been called “induced errors.”

Strategies of communication are used by the learner to get meaning across when the interlanguage system does not yet provide the requisite forms to do so in a native-like way. In the attempt to communicate meaning (for example, to refer to an electrical cord in English) when the IL does not contain the exact lexical item needed, learners can use a variety of strategies of communication. So, for example, they can use an approximate term (*a tube*); describe its function (*a kind of corder that you use for electric thing I don't exactly the name*); or describe its appearance (*a wire with eh two plugs in each side*). Sometimes the linguistic forms and patterns used in such attempts, if they prove successful in communicating with the interlocutor, persist for a time in the learner's interlanguage.

Strategies of learning are the learner's conscious attempts to master the target language. Examples of such strategies are the use of mnemonics to remember target vocabulary, the memorizing of verb declensions or textbook dialogues, the use of flash cards, and so on. Clearly, such strategies are often successful, but they can also result in error. For example, the mnemonic mediator word may become confused with the TL word. An example of the latter might be that an English-speaking learner of Spanish might use a mediator word *pot* in order to remember that the Spanish word for *duck* is *pato*—but might end up using the English word *pot* in interlanguage productions.

Selinker's five hypothesized cognitive processes have in fact been shown in empirical studies to affect the construction of interlanguages.

The Relevant Data for the Study of Interlanguage

What data should be used to study interlanguage rules? According to Selinker (1972), the relevant data are utterances produced by second language learners when they are trying to communicate meaning in the target language in unrehearsed situations. Other data are irrelevant—learner utterances produced in response to classroom drills and exercises, and learner introspections and intuitions about what is grammatical in the target language. In such activities, the learner's attention is focused on grammar rules or target language forms. Such data, according to Selinker, do not provide information about the interlanguage system that underlies spontaneous unrehearsed speech production. Rather, it tells you what the learner has consciously learned about the target language system, and not what the learner actually uses to generate IL utterances in meaning-focused communication.

From the beginning, other scholars disagreed with Selinker about what data should be used to study interlanguage. Corder argued that researchers ought to draw upon a wide range of data sources—including learner intuitions of grammaticality—in exploring learners' language. Others, particularly those investigating the role of universal grammar in SLA, shared Corder's perspective. But Selinker argued that when one uses these different data elicitation techniques, they provide information about different linguistic systems. There are, after all, three linguistic systems involved in the mind of the learner: NL, IL, and TL. If one asks a learner whether a given sentence is grammatical, one cannot be sure whether that learner's response is based upon the NL norm, the IL norm, or the learner's perception of the TL norm. All these responses may be different from the IL norm revealed in that learner's utterances produced in the attempt to communicate meaning. In essence, the most basic research-design question involved in the study of interlanguages—what data shall we use to study interlanguage?—raises very complex issues concerning the relationship between intuitions of grammaticality, language production, and language perception, very similar to issues raised by Labov (1970) in sociolinguistic work. This issue is still unresolved in SLA research, and in fact is complicated by research cited below that shows systematic style-shifting in interlanguage accuracy depending on the learner's attention to speech, which in turn is affected by interlocutor and other contextual features.

The Revised Interlanguage Hypothesis

There have been some modifications and expansions to the interlanguage hypothesis since it was proposed in print in 1972. Some of these have been hinted at and will be expanded upon below.

The original interlanguage hypothesis was restricted to apply only to adults acquiring second languages. However, subsequent studies in French immersion programs in Canada showed that children produced interlanguages that were apparently fossilized, and had

substantial influence from native-language transfer. There appeared to be sociolinguistic reasons for this phenomenon; the children received native-speaker input only from their teacher and gave each other substantial non-native input. They had not usually been given enough opportunity and incentive to produce what Swain (1995) called “comprehensible output”—attempts to produce the interlanguage in meaningful communication with others.

A second expansion of the IL hypothesis occurred in response to the growing interest in the influence of universal grammar on the development of interlanguage. Universal grammar is assumed to be central to the development of natural languages; but is interlanguage a natural language? Selinker’s initial hypothesis argued that IL is not, following this reasoning: (a) Natural languages are produced by universal grammar (UG); (b) but interlanguages, unlike native languages, fossilize and evidence native language transfer; (c) interlanguages therefore must be produced by cognitive processes other than UG; (d) therefore ILs do not have to obey language universals. Adjemian (1976) took the opposing position, arguing that interlanguages *are* natural languages (although, unlike other natural languages, IL rule systems are “permeable” to invasion from NL and TL rules systems). In this view, interlanguages are products of the same universal grammar (UG) that produces native languages. As natural languages, interlanguages have to obey language universals. Unlike other natural languages, ILs fossilize because of complex changes in cases where parameters have already been set for the NL, and a TL with different parameter settings must be learned. Debate on this issue has certainly been ongoing and lively (White, 1990).

A third change to the interlanguage hypothesis has been a growing interest in the way interlanguage forms shift and change in different social contexts (Tarone, 1979, 1988). Increasing research evidence shows that learners can produce a significantly more fluent, grammatical, and transfer-free interlanguage in some social contexts than in others, and even that social contexts can change developmental sequences in SLA (Tarone & Liu, 1995). International teaching assistants, for example, may be more fluent and grammatical in lecturing on their academic field than when talking about an everyday topic like favorite foods or bicycling (Selinker & Douglas, 1985). Key processes such as fossilization may be more prominent for a given learner in one context than in another. Bayley and Tarone (in press) review variationist SLA studies and conclude that these show that much of the variation that we see in learner language is systematic. Variation in interlanguage production, documented in dozens of variationist studies, certainly has profound implications for data elicitation and analysis in research (Preston, 1989, 2002; Tarone, 2007; Geeslin & Gudmestad, 2010). Variationist researchers argue that because production of given interlanguage forms varies systematically in relation to accompanying linguistic variables, task, topic, focus on form, interlocutor, and so on, then researchers need document the contextual factors in play in each elicitation, and use sophisticated statistical tools to model interlanguage. Conceptually, the chameleon-like character of ILs raises serious questions about whether and how traditional linguistic notions that were developed to account only for monolinguals in fact apply to the bilingual mind. This is a complex problem for SLA researchers to resolve.

A fourth issue is the phenomenon of fossilization itself. How inevitable is fossilization? What are the forces that lead to the cessation of learning? Scovel proposed the Joseph Conrad Phenomenon, to draw attention to the very common case where an adult learner’s phonological system may fossilize, but the morphology, syntax, and lexicon may not, continuing to develop into full identity with the target language. Scovel (1988), like Selinker, argues that the causes of phonological fossilization are neurolinguistic in nature, and related to the process of cerebral lateralization, which is completed at puberty. But there is certainly disagreement among interlanguage researchers as to both the inevitability of fossilization, and (relatedly) the causes of fossilization (Han, 2004). Typically, those who

argue that fossilization is caused by sociolinguistic forces (such as group pressure to conform to NL norms) also argue that fossilization is not an inevitable process. Such researchers suggest that if learners can identify with the TL social group, or if their need is great enough, they will be able to continue learning the second language until their production/perception is indistinguishable from that of native speakers. This issue also is far from settled.

There has been some change in the way some of the psycholinguistic processes shaping interlanguage are viewed. For example, native language transfer is now viewed as operating selectively: some things transfer from the NL to influence IL, and some things do not. A crucial question at present, therefore, is: what gets transferred? Can we predict in advance which NL characteristics will influence an IL and which ones will not? One promising notion is that of multiple effects: when NL transfer combines with other influences, such as markedness factors, learning strategies or transfer of training, then there will be greater likelihood of fossilization. So, for example, an early stage of verbal negation common among all second language learners involves putting a negator (like *no*) before the verb. Spanish does negate verbs this way (as in *Juan no habla* for *John doesn't talk*) and Spanish speakers acquiring English L2 are more likely to fossilize at this stage (producing *John no talk*). Thus, negative NL transfer has the effect of amplifying the possibilities for fossilization when it interacts with other influences, such as stages of L2 acquisition. The psycholinguistic process of learning strategies first identified by Selinker (1972) has become a focus of considerable research (Cohen and Macaro, 2008). This research has led to many educational applications, such as the establishment of workshops and handbooks to train students to use language learning strategies (e.g., Mikk, Cohen, & Paige, 2009).

Finally, research on interlanguage has expanded far beyond its original focus on phonology, morphology, syntax, and lexis, to include the sociolinguistic component of communicative competence. Research on interlanguage pragmatics now includes comparative work on the way learners execute speech acts across three linguistic systems (Kasper & Rose, 2003).

The interlanguage hypothesis provided the initial spark that ignited a field of research on second language acquisition/learning, and it continues to provide a broad and productive framework for research across multiple theoretical orientations. The research questions it originally raised continue to be among the most central and interesting research questions in the field.

Interlanguage Pragmatics

J. CÉSAR FÉLIX-BRASDEFER

Interlanguage pragmatics (ILP), or second language (L2) pragmatics, is the study of how learners, whether adults or children, acquire the ability to produce and understand communicative action in an L2, such as refusing an offer for food, asking a professor to write a letter of recommendation, complaining about an unfair grade on the final exam, or knowing when it is appropriate to remain silent in conversation. Pragmatic knowledge, one aspect of learners' communicative competence, is comprised of two components necessary to communicate effectively in an L2: The first, pragmalinguistic knowledge, refers to the linguistic resources that are available in a particular language and that are necessary to express a specific communicative effect. This includes knowledge of different forms and their meanings. For example, the form *I can't* (literal form) can be used in English to express a refusal to an invitation. But when refusing an invitation to a birthday party a speaker can select from a variety of other linguistic forms to convey the refusal; for example, *Thanks, but I really can't; I'm sorry, but I have plans; I don't know, I have to think about it*. The second component, sociopragmatic knowledge, refers to knowledge of social conventions at the perception level, such as an awareness of the differences in social distance or social power among interlocutors. For instance, it includes knowledge of what expressions are appropriate (or are not appropriate) to use in an L2 when refusing a professor's advice to take a class or apologizing to a friend for crashing his or her car over the weekend.

Overall, ILP is concerned with how L2 learners learn how to *do things with words* over time in the learner's own country (foreign language settings) or in natural contexts where the target language (TL) being learned is spoken by native speakers (NSs) of the learners' TL (L2 settings) (see also Leech, 1983, and Kasper & Rose, 2002, chap. 1).

This entry is organized as follows. First, I present the scope of ILP, which includes its definition as an interdisciplinary field, two perspectives on pragmatics with implications for ILP research, and the role of pragmatic transfer. The next section highlights the role of pragmatic development in an L2 from three views, and finally, I present the conclusion.

Defining the Scope of Interlanguage Pragmatics

ILP lies at the intersection of the study of second language acquisition (SLA) and pragmatics. ILP, like SLA and pragmatics, is an interdisciplinary field that has been studied from various theoretical, analytical, and methodological perspectives.

SLA

The field of SLA examines how learners, whether children or adults, of an L2 (or third or subsequent languages), with (limited) exposure to that L2, sequentially learn or do not learn its linguistic system, namely, the sound system (phonology), vocabulary and word formation (morphology), how meaning is expressed in words or sentences (semantics), and how sentences are formed (syntax); SLA investigates the degree of proficiency that learners achieve in an L2. In addition, SLA examines the extent to which learning is conditioned by individual differences such as age, gender, motivation, aptitude, proficiency in the native language, or cognitive styles (e.g., learning with visual or auditory input),

2 INTERLANGUAGE PRAGMATICS

among others (for more information on the scope of SLA see Gass & Selinker, 2001; Long, 2007; Ellis, 2008). When analyzing the production and comprehension of L2 learners, SLA researchers often refer to three linguistic systems: (a) the language produced by L2 learners, referred to as the interlanguage (IL); (b) the learner's native language (NL), also called the mother tongue, or the first language (L1); and (c) the TL or the language being learned (Selinker, 1972).

Perspectives on Pragmatics

Pragmatics dates back to philosophical thinking of the early 19th century and was introduced by the American philosopher Charles W. Morris (1901–79) as one of the three components of semiotics, the science of signs. Specifically, Morris defined pragmatics as “the study of the relation of signs to interpreters” (1938, p. 6). In modern linguistics, pragmatics is broadly defined as the study of language use in context. Pragmatics can be analyzed from two perspectives: the cognitive-philosophical view (or Anglo-American pragmatics) and the sociocultural-interactional view (or European-Continental pragmatics) (Huang, 2007; Haugh, 2008).

Under the first view, pragmatics is considered to be one of the components of the mental grammar (similar to phonology, morphology, semantics, or syntax) and includes concepts such as deixis, speech acts, and conversational implicature. Deixis has to do with reference, specifically the various ways in which languages encode the features of the context of the utterance (e.g., “Move *this* book *here* and *that* one *over there*”). The study of speech acts or speech act theory, introduced by British philosopher John L. Austin (1911–60) in *How to Do Things With Words* (1962) and later revised and expanded by American philosopher John R. Searle (1932–), represents one of the most frequently studied topics in ILP. The focus of analysis in ILP has been on what Searle called the “illocutionary force” of the speech act (i.e., the communicative force of an act such as requesting or promising), indirect speech acts (Searle, 1975) (e.g., “*I was wondering* whether you would have time to write me a letter of recommendation”), and Searle's five-way classification of speech acts (1969, 1976): representatives (informing, stating), directives (asking, requesting), commissives (promising, refusing), expressives (complimenting, congratulating), and declarations (appointing, declaring).

The concept of conversational implicature was introduced by British philosopher Paul Grice (1913–88) to show how meaning expressed by the speaker (speaker meaning), not directly encoded in the words, can be inferred (recognized) by the hearer (Grice, 1975). For example, if speaker A says “Has John arrived?”, and speaker B responds “There is a blue car in the driveway,” one can infer, under the appropriate circumstances and based on shared assumptions between the interlocutors, that John has arrived. The ability to interpret implicature in an L2 was initially investigated by Bouton (1994). He examined the ability of advanced non-native speakers of English living in the United States to interpret various types of implicatures in English (e.g., irony and indirect criticism) using a cross-sectional design (i.e., with data collected from learners at various proficiency levels). It was found that the learners' ability to interpret implicatures in American English seemed to have been achieved during the first 17-month period. After 17 months in the L2 culture, the learners' ability to interpret most implicatures stabilized, and progress was slow. While the acquisition of L2 implicature may take time, it has also been shown that pedagogical intervention seems to facilitate learning (Rose & Kasper, 2001; Rose, 2005).

Regarding the second view, the sociocultural-interactional perspective, pragmatics is concerned with social interaction and takes into account both the speaker's message and the interlocutor's response to that message. The field of ILP has adopted the methodology and theoretical frameworks initially proposed in the field of cross-cultural pragmatics for

contrasting two or more languages in the analysis of requests, apologies, refusals, suggestions, and so forth. First, with respect to methodology, the methods commonly used to collect speech act data include written questionnaires, role plays, scaled-response questionnaires, and multiple-choice questions. The study of speech acts also includes the analysis of authentic discourse (natural conversation or institutional discourse such as service encounters), elicited conversation, interviews, diaries, and verbal reports (learners' verbalizations of linguistic action). Second, regarding the theoretical frameworks utilized, ILP has mainly employed Brown and Levinson's 1978 universal model of linguistic politeness (Brown & Levinson, 1987) to examine whether NSs of a given culture or L2 learners employ linguistic strategies that are oriented toward satisfying the hearer's positive face through positive politeness strategies (e.g., agreeing with the interlocutor; use of in-group identity markers such as *come here*, *honey*) or negative face realized through negative politeness strategies (e.g., being conventionally indirect, as in *Can you please pass the salt?* or use of hedges such as *I think that John is coming too*).

Learners' ability to express politeness in an L2 is a frequent topic of study in ILP research. For example, one of the earliest cross-sectional studies on the development of L2 requests is Scarcella's (1979) analysis of the emergence of polite features when performing English (role-play) requests in two learner groups: one group of beginners and one advanced group. The author found that the learners' use of internal modifiers to express politeness in their requests (e.g., *please*, *maybe*, *kind of*, *I think*) improved with increasing proficiency. Using role-play data, other studies have shown that direct requests decrease and a preference for conventional indirectness (using higher levels of polite requests) emerges with higher proficiency (Achiba, 2003; Hassall, 2003; Félix-Brasdefer, 2007).

The notion of pragmatic transfer plays an important role in ILP research. In ILP, transfer occurs at both the pragmlinguistic and the sociopragmatic level. First, pragmlinguistic transfer may occur when learners transfer specific expressions from their L1 to communicate linguistic action and these features coincide in form and function with those forms used by NSs of the TL (positive transfer). On the other hand, negative transfer (or interference from the L1) occurs when pragmatic features from the L1 are transferred inappropriately to the L2; for example, when US learners of Spanish use the conventionalized form in English *I'm sorry* to express an apology in Spanish (L2) (e.g., *lo siento*). This represents an instance of negative pragmatic transfer (or an instance of pragmlinguistic failure), as *lo siento* does not occur among NSs of Spanish with the same frequency, in the same contexts, and with the same function as in the TL (Márquez Reiter, 2000, pp. 151–2). Second, sociopragmatic transfer occurs when learners transfer the sociocultural norms or perceptions with regard to their understanding of social distance or social power from their L1 to the L2, although there may be differences between the L1 and L2. For instance, an insistence after an offer or following a refusal to an invitation represents a sociocultural expectation in many cultures (e.g., Peru, Mexico, China), while in other societies an insistence may be viewed as an imposition or inappropriate behavior (e.g., United States).

Nevertheless, before making generalizations with respect to pragmatic transfer, one must also consider the role that universal pragmatic competence plays in learners' production and comprehension of linguistic action. That is, adult learners come to the classroom equipped with different types of implicit (pragmatic) knowledge and ability to do the following: knowledge of the rules of politeness; knowledge of the form and use of communicative acts (e.g., refusing, requesting); knowledge of the sequential structure of conversation (e.g., turn taking, repair, openings and closings); and knowledge of formal and informal registers (e.g., talking to a professor vs. talking to a close friend) (see also Kasper & Rose, 2002).

In general, regardless of the unit of analysis or the method selected to examine communicative action, the ultimate goal of ILP is not only to analyze learners' ability to produce

and comprehend linguistic action in formal and informal situations in an L2, but also to determine how learners acquire the pragmatic system of the TL through social interaction over time. As a result, ILP examines learner language from two angles: how L2 learners produce and comprehend linguistic action (requesting, refusing, apologizing; L2 *use*) and how they develop the ability to produce and understand action over time in an L2 (L2 *learning*). In particular, in ILP the focus is on making associations between the form, function, and communicative effect of a particular action (requesting, refusing) in the context in which L2 production or comprehension takes place (Beebe, Takahashi, & Uliss-Weltz, 1990; Kasper, 1992, 1998).

Pragmatic Development in a Second Language

A central topic in ILP concerns how learners of second (or third, fourth, or subsequent) languages develop the ability to produce and comprehend linguistic action over time. Pragmatic development has been examined in at least three ways: pragmatic development in naturalistic settings, pragmatic development in study-abroad contexts, and pragmatic development as a result of classroom instruction. Each of these will be examined below.

Pragmatic Development in Naturalistic Settings

Research on pragmatic development as a result of exposure to input in naturalistic settings began in the early 1980s and has examined learners' ability to perform and comprehend different speech acts (e.g., requests, refusals, suggestions) and different conversational practices (e.g., greetings, farewells) in different contexts, namely, everyday encounters, classroom settings, and institutional settings (e.g., in student-advising sessions). For example, research has shown that over time some adult learners of English develop the ability to make appropriate rejections (e.g., *Can I think about it?*) and suggestions (e.g., initiated suggestions) when negotiating their class schedule with their advisers (Bardovi-Harlig & Hartford, 1993). With respect to the acquisition of requests, five stages of development have been identified: The first stage begins with minimal linguistic forms expressing an intention to request (e.g., *Me no pencil*); in the second stage learners start using routine formulas (e.g., *Let's play the game*) and rely on imperatives (e.g., *Open the door*); in the third stage there is the presence of conventional indirectness and other language forms (e.g., *Can you pass book?*); in the fourth stage learners become creative with language and use different forms and tenses (e.g., *Could I have another chocolate for my friend?*). Finally, in the fifth stage learners use a wide range of requests in a variety of contexts. (See Achiba, 2003, and Kasper & Rose, 2002, chap. 4, for a detailed analysis of L2 pragmatic development.) In general, it should be noted that each of the stages that account for pragmatic development may vary from learner to learner, according to the age and gender of the learner as well as to individual differences such as motivation, the topic of the conversation, the context of learning, foreign language (FL) versus second language (SL) contexts, and so forth.

Pragmatic Development in Study-Abroad Contexts

Pragmatic development has also been documented among learners who study abroad for different periods. Unlike learners who study an L2 in the FL classroom with limited access to natural input, learners in study-abroad (SA) contexts may improve their pragmatic knowledge as a result of exposure to authentic input from NSs of the TL and frequent participation and varied opportunities in the target culture. To observe pragmatic development in SA contexts, researchers often compare the development of learners who receive

instruction at home (AH) in the FL classroom with that of learners in SA contexts. The learner data are usually collected at various times (prior to departure, during, and at the end) to examine whether learners who are exposed to the TL during an SA experience improve their knowledge in various aspects of pragmatics at both the production and (and to a lesser degree) comprehension levels in communicative acts such as requesting, apologizing, advising, and conversational activities, namely, greetings, repetition, self-repairs, and accuracy checks.

Pragmatic Development as a Result of Classroom Instruction

Although learners who are exposed to pragmatic input in naturalistic settings acquire certain aspects of pragmatics over long periods, adding an instructional component facilitates the learners' ability to produce and interpret linguistic action. That is, learners who receive instruction in pragmatics, through explicit or implicit teaching, and participate in activities which raise their awareness of communicative actions, outperform those who do not receive instruction (Bardovi-Harlig, 2001). Many aspects of pragmatics can be taught in the classroom, but teachers need to incorporate elements that are appropriate to the level of proficiency of the student. For instance, certain aspects of linguistic action that are not linguistically complex (e.g., greetings, compliments, openings and closings) can be taught at the beginning levels of instruction in the classroom by means of making input salient (e.g., bolding certain elements necessary to make a request), followed by communicative activities that help the learner notice both the form and function of particular expressions used in a specific context. Other concepts in pragmatics that require sophisticated linguistic knowledge can be taught at more advanced levels of proficiency at the discourse level, such as issuing and declining invitations, which require negotiation of these actions across multiple turns. (Studies that examined the effects of instruction in L2 pragmatics include Bardovi-Harlig, 2001; Rose & Kasper, 2001; Rose, 2005.)

Conclusion

ILP studies how learners of L2s at various proficiency levels acquire linguistic and nonverbal action over time as a result of exposure to input alone in the classroom (FL contexts), through exposure to natural input in the host environment and in everyday interaction with NSs of the TL (SL contexts), or as a result of pedagogical intervention in the classroom. Learning an L2 requires not only knowledge of the linguistic system of the TL (sounds, word formation, sentence structure, and meaning), but also knowledge of the linguistic and nonverbal resources necessary to perform and understand communicative action according to the sociocultural expectations, rules of (im)politeness, perceptions of social distance and power, and the various mechanisms of social interaction, such as opening, closing, and repairing conversation (for an in-depth discussion of these topics see Gass & Houck, 1999; Kasper & Rose, 2002; Ishihara & Cohen, 2010; Tatsuki & Houck, 2010). Thus, ILP should go beyond speech acts as single units of analysis, and instead focus on the analysis of communicative action at the discourse level using theoretically and pedagogically informed models. In this way, we will advance our understanding of both the learning process and the pedagogical value of L2 pragmatics in the classroom.

Internalization in Second Language Acquisition: Social Perspectives

EDUARDO NEGUERUELA-AZAROLA

A social perspective to teaching and learning a second language in the field of second language acquisition (SLA) utilizes the notion of internalization to capture both the social origin of learning—even in private settings—and the non-mechanistic or simplistic quality of the processes involved in learning and communicating in new languages (Lantolf & Thorne, 2006; Lantolf & Poehner, 2008).

Research on internalization explains how the social plane is the starting point to construct new meanings when we learn a second language. When learning a new language, our social communicative activity is the origin for noticing and understanding words and phrases. These words and phrases, which we encounter in oral and written discourse, are then transformed into personal meanings; and at the same time, our personal meanings are again transformed into social communication. This continuous transformation of social meanings into private meanings and private meanings into social ones partly explains the richness and complexity of the second language learning processes.

Describing and understanding the specific connection between our social speech and our inner order and its critical role in learning a second language is the goal of research on internalization in SLA. This connection is not direct or simple. As learners of new languages, many of us have experienced how the social context provides a rich source of experiences for communicating with others. We hear new words, notice new sounds, and try using phrases that we just heard or read. However, we also experience that it is not only about noticing language features and using them to communicate in a social setting. Some features of languages are not easily noticed and used. Second language teachers, and sometimes even friends who communicate in the second language better than we do, often give us feedback about language features that we keep using incorrectly, mistakes we make with pronunciation, and phrases we keep forgetting when we write. The connection between what we learn in social settings and what we take away and use in different contexts, what we internalize and take with us, is not simple and direct.

From a pedagogical point of view, in second language teaching, research on the internalization of second languages is thought to be the key to understanding learning processes from a sociocultural perspective. Consequently, understanding and promoting internalization is the key to properly organizing adequate teaching efforts in classroom settings (Lantolf, 2003). This is the basis for a conceptual approach to teaching languages (Negueruela, 2003).

The category of internalization reaches the field of SLA from the field of social psychology, specifically sociocultural theory (Wertsch, 1985; Lantolf, 2000). Internalization is a psychological construct that articulates the connection between the world outside us—our external bodily experiences in the contexts in which we live—and the world inside us—our internal experiences, that is, our self-conscious awareness.

According to Vygotsky (1930/1978), internalization processes originate socially in concrete human activities and are culturally mediated by semiotic tools, primordially language. Internalization is not immediate and mechanical but mediated and transformative. When

internalization takes place, an external activity performed in the world becomes imitated, appropriated, transformed, and performed as an internal one in one's thinking world (Vygotsky, 1930/1978). Internalization is the origin of mediated thinking, and it is always connected to externalization: the communicative act of making visible our conceptualizations.

From a psychological point of view, the development of mediated thinking is nonlinear and non-incremental. Mediated thinking through conceptual categories does not proceed from simple to complicated. Conceptual categories as tools for thinking are not internalized by adding a few meanings or features to a word definition. Conceptual categories as tools for thinking are created, internalized, and transformed when used for thinking in communication with the self (Vygotsky, 1934/1986).

Each transformation changes the relationships between concepts, and the connection between concepts and referents. It is not only about the meaning of concepts, but also how they are used and applied for thinking. More sophisticated and theoretical concepts are different tools with different qualities when compared to simple unsystematic everyday conceptual meanings (Kozulin, 1998).

Systematic concepts, as tools for mediated thinking, allow us to look at the world differently. It is not the same to look at the world through sunglasses, binoculars, a photo camera, a video camera, or even a kaleidoscope. And to push the metaphor, video cameras are not simply constructed or used as more complicated eyeglasses. There needs to be a transformation in the form, the use, and the function of the tool.

Mediated thinking is also distributed and situated, always social even in private settings. From a sociocultural perspective, all contexts are social: Our social history accompanies us even when we are alone. And all contexts are private: We are always private beings making sense of the world even in social settings (Vygotsky, 1971). Consequently, internalization does not equate internalized thinking with thinking inside our heads. According to Salomon (1991), internalization is a process of internally developing orienting tools for thinking through them about the world in the world (repetition intended). Social and private planes merge in internalization processes. Internalized psychological cultural tools are only meaningful in human activity, be that in a primarily social or primarily private context.

The notion of internalization was articulated by Lev S. Vygotsky within the fields of psychology and pedagogy in the 1920s. Based on the work of Vygotsky, a contemporary social view on internalization is articulated through sociocultural theory (SCT; see Daniels, Cole & Wertsch, 2007; Valsiner & Rosa, 2007). For SCT, contemporary social ways of acting are fundamentally cultural. Culture is, directly put, history in the present (Cole, 1996). Based on proposals emerging from social views on human thinking in the late 19th and early 20th centuries (see Valsiner and van der Veer, 2000), Vygotsky (1930/1978) argues that internalization is the reconstruction of an external operation into an internal one. This reconstruction is not direct. The concrete and material circumstances and reality of the outside world cannot be directly reconstructed inside our immaterial minds. The doing in the world, acting, is different from the doing in our minds, thinking. The materiality of doing in concrete contexts is different from the immateriality of thinking in our minds.

The question is then: How does the social outer world enter the inner world of thinking if both worlds are different in quality, that is, one is material and the other is immaterial? The issue is that there cannot be a direct unmediated connection between the two worlds. The lack of direct connection between our outer and inner life is the basis for what is referred to as "Cartesian dualism" (Lantolf & Thorne, 2006).

Strong Platonist-oriented cognitivists would argue that there is no such connection. That which is unique about human thinking is preprogrammed and already present and represented from birth in embryonic form. From this perspective, internalization is only a question of maturation in the right environment. Upholding the opposing view, strong behaviorists, or even some strong constructivists, agree with cognitivists in the lack of

connection between the outside and the inside world. However, strong behaviorists will argue that the world and its mental representations are completely constructed and assimilated from the outside through social activity. The inside is just an empty but responsive repository. From a strong behaviorist perspective, internalization is a direct and immediate apprehension of the world and its representations. In such a view, our inner order has little effect on our representations.

A sociocultural view of internalization does not concur with either strong cognitivist or strong behaviorist or even some strong constructivist takes. SCT offers an alternative cultural option. There is a connection between our mind/thinking being and our bodily/acting experiences in the world. But it is not a direct connection; it is a historical one using cultural artifacts that are only susceptible to being internalized through socially mediated activity (Vygotsky, 1930/1978). Hence, Vygotsky proposes that the connection from the outside to the inside is mediation that leads to internalization.

Human development, ontogenesis, is a historical process fostered by mediation through cultural semiosis: the use of culturally inherited signs (i.e., language) as tools for communication and conceptualization. This is the sociocultural solution that overcomes the still pervasive Cartesian dualism in human sciences. The outside/body/social and the inside/mind/private are connected in ontogenesis, in our development as humans, when our personal natural evolution is transformed through participating in socially constituted culturally mediated significant activities. Through internalizing cultural ways of mediated thinking we learn to self-regulate our activities. The outside world is the origin of our thinking tools, but this social origin needs a historical transformative avenue into the human mind. To be sure, there is not an immediate connection. The way in for socially originated thinking processes, which are material in origin but immaterial in consciousness, is primarily by using mediation through speech.

Thinking mediated by speech, communicative activity using human language, allows for the internalization of mediated semiotic representations. Perception mediated by speech or other semiotic tools becomes conception. This process explains the emergence of higher forms of human consciousness: intentional memory, voluntary attention, planning, conceptualization, and categorization. All these uniquely human forms of thinking are intentional (there is a conscious attempt to make sense of the world), social in origin (we first act together with others before acting independently), but historical in substance since higher forms of thinking are mediated by historical semiotic means, which consist of languages—fundamentally—but also music, mathematics, or drawing. Furthermore, language as a cultural tool becomes more powerful with literacy. Literacy is a historical, social, and semiotic activity that allows for transforming speech into a permanent and powerful written artifact for the creation and interpretation of linguistic representations.

More precisely, how does language, or better yet speech—written or oral—transcend the Cartesian dualism in internalization? Speech is a human tool with dual qualities. It is dual in the sense that it is bidirectional. It has a material side and directs our behavior in the world, but it is also abstract and creates psychological representations directing our attention in our thinking world. Thus, it is material in the sense of objective—sound and writing are physical in nature—and immaterial—the meaning is abstract and fluid but contextually situated and concrete through specific senses (Vygotsky, 1934/1986). It is both social and communicative—it allows for transaction and interaction—but it is also private and conceptual—it constructs representations and orientations. As mentioned above, these dual qualities of speech can be theoretically constructed as dualisms (repetition intended): as in a strong cognitivist point of view—all representations of the world are internal and the outside reality is minimally relevant—or in a strong behaviorist point of view—the outside world determines our views socially, but not historically, and our inside reality is just a biological container.

In a social and cultural point of view on internalization, the duality of language overcomes dualisms (repetition intended). Language is social and historical but also private: a meaning for the other is a meaning for the self and vice versa. Communication with each other is simultaneously a process of conceptualization. Once we are socialized through culture, we are always social, even in private settings, since our history always accompanies us through our verbally mediated thinking processes. Still, not all forms of thinking are mediated through semiotic means. Direct sensory perceptions, unmediated memory, direct planning, unsystematic categorization are still present in our thinking.

Our most powerful ways of thinking are mediated by cultural tools, generally linguistic signs. Our past experience, personal and social, is cultural and becomes intentional memory—a conscious attempt to remember—through stories in the form of written and oral narratives constructed and reinterpreted again and again through our interactions. Our present, our orientation to the world through categorization, is not about perception but about conception mediated through linguistic taxonomies, through expository texts of different genres: from news and editorials to instruction manuals. Our future, our planning, is based on historically constructed artifacts that are semiotic in nature: calendars, maps, plots, clocks, and argumentative texts of all types, which delineate alternate and preferred futures.

Internalization leads to the emergence of higher forms of consciousness, but mediation is the key to understanding the development of symbolic means. As humans we are always making sense of the world through the most powerful tool we have at our disposal: the historical powers of meaning making through language. Linguistic mediation is central in internalization from a social perspective. But language is a tool without *a priori* instructions. We learn to use it through communication, but it only becomes visible in formal settings, fundamentally schooling. Language instruction is central in schooling. Indeed, literacy, academic or other types, is an essential activity for amplifying and reorganizing the cultural powers of mediated thinking through language.

In formal educational settings, internalization addresses the social/outer origin of developmental processes which are qualitatively transformed from social/outer into self/inner thinking processes during learning activity (Kozulin, 2003). The importance of formal educational settings in modern societies allows for a distinction between everyday concepts and theoretical or scientific concepts, according to Vygotsky (1934/1986). Everyday concepts are mediated understandings of the world internalized in the course of everyday experience. These understandings are not as systematic as theoretical meanings constructed in school settings.

The internalization of conceptual categories is a long process that begins in school and lasts our whole lives. Vygotsky (1934/1986) elaborates on the different developmental stages of conceptual development (heaps, complexes, pseudoconcepts, and theoretical concepts) which lead to internalization during human ontogenesis. Conceptual meanings are the core for the internalization of higher mental processes. Concepts are historical tools of the cultural mind that are internalized in social settings. The critical link is the use of concepts as a tool for understanding. However, internalization is not an easy-to-promote process. Transformative imitation, as a process of transformation of external activity from the interpsychological plane, activity with others, to the intrapsychological plane, solo activity, is the origin of internalization.

From the point of view of formal teaching, how can teachers promote internalization in learning activity? Vygotsky argues that teachers need to first acknowledge the social origins of all learning. That is, a task that a learner cannot do by herself or can only do with the help of others is transformed into a task that she is able to do by herself, and sometimes even inside her head. This understanding is the basis for the notion of the zone of proximal development (ZPD). However, in a SCT view to second language learning, learning

and development are not the same processes (Negueruela, 2008). Again, the critical link is the notion of mediation; that is, the process of internalization is not based on the direct transformation of ideas or actions, but on acting through semiotic means, fundamentally using linguistic signs as psychological tools for understanding.

Not all cultural tools are susceptible to being internalized and not all learning implies internalization in a developmental sense. There are certain conditions for internalization as a transformative developmental process. First, the nature of the internalization process leads only to learning or learning and development. As Salomon (1991) argues, there is a difference between simply learning (cultivation or mastery of cultural artifacts) and internalization (thinking through specific cultural tools). In second language acquisition, one can learn morphology, syntax, or words, but internalization is about development: using words-concepts as thinking tools to make sense of the world. Second, the nature of the internalized tool we use is critical. Some cultural tools cannot become psychological representations for thinking. Internalizing a semiotic representation with thinking capabilities depends on the nature of the tool used and what we do with it. Mastering the use of a spreadsheet can be attained through learning, but thinking about calculus in terms of spreadsheets can only occur as a result of development. And finally: How do we engage with psychological tools? We need to mindfully engage and use psychological tools (conscious awareness), that is, use the conceptual tool in learning activity, being aware of what we do and how we apply a conceptual representation.

The construct of internalization has been criticized from both the innatist/cognitivist and the behaviorist/constructionist camps. On one hand, innatists like Fodor (1980) argue that internalization cannot explain individual development. Vygotskian principles would answer that development is not individual but social. On the other hand, some scholars taking a constructionist stance argue that internalization is still a cognitive construct that does not take into account the social aspect. Rogoff (1995) maintains that internalization solidifies a dichotomy between the social and the individual. Vygotskian ideas would reply that internalization is not about distinguishing between the social and the individual but about cultural mediation. Other constructs have been proposed as alternates to highlight different aspects of human ontogenesis. Notions such as mastery, emphasizing the tool and material quality of human mediation, or the notion of appropriation accentuating the social origin and quality of human activity, have been proposed (see Wertsch, 1998). In any case, a transformative understanding of internalization already acknowledges the social and cultural complexity of developing a social mind through semiotic mediation.

In the field of second language acquisition, sociocultural researchers (Lantolf & Thorne, 2006; Lantolf & Poehner, 2008) utilize internalization as a key theoretical construct to understand how second language learning and development proceeds in both formal teaching and non-formal contexts. Internalization highlights and captures the nonlinear quality of development of new semiotic—meaning-making—tools of communication and conceptualization when learning new languages. Specifically, internalization, as an analytical category, has been linked to two main areas: research on private speech in second language learning with an internalization function and research on conceptual instruction to promote internalization.

Research on internalization and private speech in second language acquisition provides insights into how learners use private speech in order to consciously internalize features of a new language they may find complicated (Lantolf, 2003). For instance, Ohta (2001) shows how Japanese learners engage in delayed imitation and find corrective feedback in situations where it was not intended as such. Learners do talk to themselves in social settings such as classrooms to promote the internalization of phonological, grammatical, and lexical issues that are challenging for them. Lantolf and Yáñez (2003) also illustrate how a Spanish learner softly repeats grammatical issues for herself in an attempt to internalize

them. McCafferty (2008) documents how Japanese learners of English utilize gesture as material foundations for constructing and potentially internalizing conceptual metaphors for the notion of an ideal marriage. McCafferty argues that perceptual actions in the form of gesture are instrumental in internalization processes in second language communication and conceptualization. In the end, research on internalization focusing on private speech and private gesture establishes a connection between the use of private speech with an internalization function and the use of speech in social externalization. Evidence in studies as the ones presented above suggests that adult language-focused private speech in classrooms is “acquisition in flight” (Lantolf & Thorne, 2006, p. 206).

In the case of internalization and teaching for second language development, Negueruela (2003) argues that second language development is as a conceptual process where instruction should be aimed at promoting the internalization of conceptual categories. Recent research on concept-based instruction fostering internalization of conceptual categories has centered on the teaching of grammar categories such as verbal aspect, modality, or voice in Romance languages to English speakers (Negueruela & Lantolf, 2006; Lapkin, Swain, & Knouzi, 2008; Negueruela, 2008); teaching of academic writing through the internalization of the concept of genre (Ferreira & Lantolf, 2008); or teaching of academic discourse to international teaching assistants (Thorne, Reinhardt, & Golombek, 2008). These studies illustrate how conscious attempts to use concepts as tools for understanding promote the internalization of conceptual categories as tools for orientation. The internalization of conceptual categories not only promotes a higher degree of conceptual awareness but also has an influence on linguistic performance. For instance, Negueruela and Lantolf (2006) document improvement in performance in Spanish written narratives where learners start using preterit and imperfect with better coherence and accuracy after learners engaged in conceptual reflection and private verbalization about the notion of verbal aspect.

Research from a social perspective on internalization in the field of second language development is still in its infancy. There is evidence that a transformative understanding of internalization is very promising to capture how learners develop new meanings of the world when learning to use a new language. Internalization from a social perspective in the field of second language acquisition is a semiotic transformative bridge between what we think and what we do when we learn to communicate in a new language.

International Law in Language Policy and Planning

ROBERT DUNBAR

Principles of relevance to language policy and planning are found in a wide range of international legal and quasi-legal instruments. The former category is comprised primarily of treaties, some global in scope and others regional (primarily European); these treaties create binding legal obligations for states, but generally only for those which have agreed to be bound by them. The latter category includes a variety of resolutions, documents, guidelines, recommendations, and other statements, generally made under the auspices of an international organization, and having varying degrees of political salience and moral force, but which do not yet constitute binding legal obligations. Most of the relevant principles in both categories are set out in human rights or minority rights instruments, although the developing international law on indigenous peoples is of importance in relation to policy for the languages of such peoples. There is only one treaty that is specifically directed at language, the European Charter for Regional or Minority Languages (the “European Charter”), a regional instrument which currently applies to 25 Council of Europe member states. Thus, there is no single, coherent global regime for managing linguistic diversity; at best, international law relevant to language planning and policy resembles a patchwork quilt, and one often having gaps and frayed edges.

International human rights law contains a number of principles of relevance, and creates certain minimum standards that reflect a language policy which is generally tolerant of linguistic diversity but which does relatively little to promote it. Relevant treaties include the United Nations’ International Covenant on Civil and Political Rights, a treaty of global scope, and important regional treaties such as the European Convention on Human Rights, the African Charter on Human and Peoples’ Rights, and the American Convention on Human Rights.

International human rights standards impose limits on what states may do to prohibit the use of a particular language or to enforce the use of an official language in private (i.e., non-state) contexts. For example, basic civil and political rights such as the right to freedom of expression and the right to freedom of association protect individuals from excessive interference by the state in the use of any particular language in private communication, in publishing and other privately owned media, in clubs, associations, and churches, and in commercial contexts (for example, an important international tribunal has ruled against attempts to prohibit use of a nonofficial language in signage displayed to the public in shops). Thus, aggressive policies of assimilation which involve significant restrictions on the use by individuals of a particular language are inconsistent with international human rights law. Furthermore, the right to freedom from discrimination, which protects against discrimination based on language, has been used by international tribunals to restrict the ability of states to single out a particular linguistic group for adverse treatment (for example by directing state functionaries not to use a particular language to communicate with the public even where those functionaries speak that language themselves), and may require privileges extended to one linguistic group also to be extended to others that are in comparable circumstances.

Generally, though, international human rights standards show considerable deference to state language policy decisions, such as the choice of an official language and the requirement that such a language be used in public institutions such as parliaments and courts and as the medium of education in schools. Indeed, international human rights standards require states to use nonofficial languages only exceptionally: for example, most of the major international human rights treaties require states to provide interpreters to people who are held in detention or face criminal prosecution, but only where the individual does not speak or understand the official language. However, international human rights law is dynamic, and the positive value that is increasingly attached in broader international law to cultural diversity—a trend that has already begun to have an impact on important international human rights tribunals such as the European Court of Human Rights—may lead to interpretation of the international human rights canon in ways that will require state language policy to become more positively supportive of different linguistic identities. Furthermore, although its potential has not yet been fully explored in a linguistic context, broader equality law, and in particular the right to equal protection of the law, may in time require states to take measures to address inequalities which result from official language policies (for example, difficulties faced by nonspeakers of official languages in accessing certain key public services, which may require the provision of translators or of service providers who speak the relevant nonofficial language).

Principles which require states to go beyond a policy of tolerance of linguistic diversity, and which may require them to take measures to actively support such diversity, have tended to appear only in international legal standards for the protection of minorities. Standard setting has been most pronounced in periods in which alleged and real mistreatment of minorities has threatened international peace and security. In the post-World War II era, there was relatively little activity until the early 1990s, when the intercommunal violence unleashed in parts of Eastern Europe by the collapse of communism led to a burst of standard setting, the most important product of which is the Framework Convention for the Protection of National Minorities (the “Framework Convention”), a regional instrument which currently applies to 39 Council of Europe member states. A number of important principles relevant to language policy can be discerned in these contemporary instruments; a significant limitation, however, is that these principles form binding legal obligations for a relatively limited number of states because, aside from those contained in the Framework Convention, they are frequently not set out in legally binding instruments.

First, many of these instruments provide for the teaching of minority languages, or for instruction through the medium of such languages, at least at primary and secondary level. Second, these instruments also often provide for the provision of services by public bodies and administrative authorities through the medium of minority languages. In both cases, though, such provision is limited to those areas in the state in which there are significant concentrations of people belonging to the relevant linguistic minority or to areas traditionally associated with that minority, and is subject to conditions such as the existence of sufficient levels of demand. Third, these instruments generally make some provision for minority language media, including access to airtime on public radio and television broadcasting services, although they tend not to be very specific as to numbers of hours of such broadcasting, scheduling, and so forth. Some instruments, such as the Framework Convention, also contain provisions on the right to recognition of personal names in a minority language, and on the use of minority-language place names and other topographical indicators on signage in areas with which linguistic minorities are traditionally associated.

As the only international treaty specifically directed at language, the European Charter deserves particular mention. Although it also came into force in the 1990s, it was a response not to reemergent ethnic conflicts but to concerns which had emerged in the early 1980s about the loss of linguistic diversity attendant on “the inevitably standardising influence

of modern civilisation and especially of the mass media." In this sense, it has much in common with some of the standard setting engaged in by UNESCO over the last decade in respect of cultural diversity (which may be of indirect relevance to linguistic matters: see "References," below); the preamble to the European Charter makes clear that its overriding purpose is cultural. The European Charter contains a number of general objectives and purposes on which states "shall base their policies, legislation and practice" in respect of all of their regional or minority languages, including the need for resolute action to promote them in order to safeguard them, and the facilitation and encouragement of their use in public and private life. Then, the Charter contains a wide range of much more detailed provisions, some of which states may apply in respect of those languages that the states themselves designate, in areas such as education, the legal system and the courts and tribunals, administrative authorities and public services, the media, cultural activities and facilities, and economic and social life. The Charter is similar to contemporary minorities' standards in generally limiting provision to geographical areas of the state in which speakers of the languages are present in significant concentrations, and conditioning provision on sufficiency of demand for the relevant services. Significantly, the Charter does not apply to languages of newer immigrants, but only to languages traditionally found on the territory of the state (e.g., Basque, Galician, Catalan in Spain; Welsh, Irish, and Scottish Gaelic in Britain; and so forth).

Finally, there have also been important developments over the last 20 or so years of relevance to the languages of indigenous peoples. Two instruments are of particular importance: the International Labour Organization's Convention (No. 169) Concerning Indigenous and Tribal Peoples in Independent Countries of 1989, which creates binding legal obligations for the 20 states which have agreed to it, and the 2007 United Nations General Assembly Declaration on the Rights of Indigenous Peoples which, strictly speaking, does not (but is nonetheless of considerable political importance). Of perhaps greatest importance in terms of language policy are the provisions of both these instruments which emphasize the teaching of indigenous languages and, in particular, teaching through the medium of such languages, to indigenous children.

From the foregoing, the following observations can be made. First, international human rights law creates a general minimum standard of tolerance of linguistic diversity. Second, international law is increasingly recognizing that states are under some obligation to both accommodate and foster diversity; however, obligations to take positive measures in support of linguistic diversity still tend to be limited to minorities- and indigenous-specific instruments, and most of the legally binding standards have been developed regionally, in Europe. Third, where international law does impose obligations to take such positive measures, it generally only requires this of the public sector; as with many domestic legal regimes which support the promotion of minority languages, there is no explicit provision for the imposition of duties with regard to language use on the private or voluntary sectors. Fourth, instruments frequently make reference to rights of speakers and obligations of states to speakers, but aside from the European Charter, generally do not require consideration of the vitality of speech communities or of the extent to which state policies are effective in promoting such vitality, and may therefore offer a limited basis for holistic language planning. Interpretation and application of relevant principles is, however, dynamic, and there is the potential for an even sharper focus to develop on issues such as the actual vitality of minority language communities, and, with it, on the adequacy of state policies in fostering vitality. By the same token, many of the recent developments of relevance have, as noted, come about as by-products of increasing international attention to minority questions. However, interest in the international community in such questions has waxed and waned over the last century or more, and, depending on what path contemporary debates about multiculturalism take, the future may equally see the development of international law in ways that are not so supportive of linguistic diversity.

International Phonetic Alphabet

ADAM BROWN

Introduction

The International Phonetic Alphabet (IPA) is a set of symbols designed to be used for representing the speech sounds of languages of the world. This set of symbols has many uses. Linguists, especially from SIL International (formerly called the Summer Institute of Linguistics), have devised new writing systems for previously unwritten languages, basing the new system on the IPA. It is also used widely in language teaching. Singers wishing to know the correct pronunciation of lyrics in unfamiliar languages rely on IPA transcriptions of the sounds (Castel Opera Arts, *n.d.*; IPA Source, *n.d.*). Extensions to the basic IPA have been made to allow for the representation of clinical speech (Duckworth, Allen, Hardcastle, & Ball, 1990), and voice quality (Ball, Esling, & Dickson, 1995).

It should be emphasized at the outset that the IPA is a phonetic alphabet, not a phonemic or phonological one. That is, it is a set of symbols that allow analysts to represent speech sounds regardless of the language being spoken, and regardless of the functional status of the sounds in that language.

Perhaps the most pervasive use of symbols based on the IPA is in dictionaries, in particular those produced in the UK for English, for indicating the pronunciation of words. This is especially important for English, since the correspondence between letters in the spelling and sounds in the pronunciation is poor, for instance the different sounds represented by the *ch* letters at the beginning of *chest*, *chef*, and *chemist*. As a result, learners who guess the pronunciation of newly encountered words from the spelling may end up with mispronunciations. With the advent in the last two decades of CD-ROMs and Internet materials accompanying dictionaries, with sound files of the pronunciation of words, dictionary transcriptions have perhaps assumed lesser importance than in the past. In light of the comment made in the previous paragraph, the symbols used in dictionaries are not IPA, in that they are language-specific. They are, nevertheless, based on IPA symbols.

IPA symbols proper should therefore be enclosed in conventional square brackets ([]) rather than the conventional slash brackets (/ /) which show that the symbols represent phonemes in (the accent of) the language being discussed (as in dictionaries). Symbols for phonemes in an accent of a language are thus the broadest type of transcription, in that they show explicitly the least detail. Transcriptions that show more than the minimum detail can be classified as narrow to varying degrees. It follows that, while there are over a hundred symbols in the IPA, only a small subset of the total will be needed in representing the sounds of a particular language. For instance, in transcribing English, there is no need to use the symbols for non-pulmonic consonants, or tones, because these do not occur in English.

The International Phonetic Alphabet is one of the main products of the International Phonetic Association (also abbreviated as IPA; hereinafter they are written as IPAssociation and IPAAlphabet). The IPAssociation conducts examinations in use of the IPAAlphabet for English (International Phonetic Association, *n.d.*), consisting of phonetic transcription of a written passage, phonetic transcription of a dictated passage, and oral production from transcription.

While use of the IPAphabet is widespread around the world, it is not universal. Some US analysts use the American Phonetic Alphabet (APA), which was originally developed for the purpose of transcribing Native American languages. UK dictionaries mostly use the IPAphabet, but many US dictionaries use a form of respelling.

History

Early attempts at a set of phonetic symbols included one by Alexander Melville Bell (1819–1905), the father of Alexander Graham Bell, the inventor of the telephone. Alexander Melville Bell was famous as a teacher and writer on the subject of speech. His system, known as Visible Speech (Bell, 1867), was aimed primarily at the deaf, and used symbols that resembled the position and movement of the vocal organs to produce the sounds.

Henry Sweet (1845–1912) devised two phonetic alphabets. One, called the Organic Alphabet, was derived from Bell's Visible Speech. The other, named Broad Romic, used symbols that were, or resembled, letters of the Roman alphabet, and was derived from a set of symbols devised by Isaac Pitman (1813–97) and Henry Ellis in 1847. It is clear, however, that even Sweet himself favored Broad Romic; his *Primer of Phonetics* (1890) was based on the Organic Alphabet, but by 1908, he was using Broad Romic for his book *The Sounds of English*.

However, it was the IPAssociation, established in 1886 under the leadership of Paul Passy (1859–1940), that in 1888 produced an alphabet widely acknowledged and used. (For reproductions of the 1888 alphabet and other early charts, see MacMahon, 1996. On the history of the IPAssociation, see Albright, 1958; MacMahon, 1986.) Famous early members of the association included Henry Sweet, Wilhelm Viëtor (1850–1918), and Otto Jespersen (1860–1943). The person from among the membership of the IPAssociation who contributed most to the development and popularization of the IPAphabet was Daniel Jones (1881–1967), who joined the association in 1905. He himself experimented with various notations, and the alphabet as a whole has been subject to various updates. Sweet had envisaged individual languages having their own phonetic alphabet, but Jones argued that there should be one alphabet that could be used for speech sounds in all languages.

The principles underlying phonetic transcription in general, and the IPAphabet in particular, were stated in 1888 (also see International Phonetic Association, 1999, Appendix 1):

1. Each sign should have its own distinctive sound.
2. The same sign should be used for the same sound across all languages.
3. As many ordinary Roman letters should be used as possible, and the usage of new letters should be minimal.
4. International usage should decide the sound of each sign.
5. The look of the new letters should suggest the sound that they represent.
6. Diacritics should be avoided when possible, as they are difficult to write and hard to see.

Jones introduced several modifications to the IPAphabet system. He standardized the convention of showing consonants produced at the front of the mouth, such as [p], on the left of the chart, and those at the back, such as [k], on the right. But perhaps his greatest contribution is the cardinal vowel system. While consonants in general involve some easily described contact between articulators, vowel sounds are produced by holding the tongue in certain positions in the oral cavity with little or no contact. The cardinal vowel system plots the position of the highest point of the tongue within the total possible vowel space. Cardinal vowels are used as reference points, mostly on the periphery of that space, and vowel sounds in any language can be described by comparing them to cardinal vowels.

Jones first met Jespersen in 1926, when Jones was invited to a Copenhagen Conference convened by Jespersen to discuss the various transcription systems in use at the time. As Collins and Mees (1998, pp. 315–16) surmise, “it must have appeared to Jones at one stage that Jespersen and his associates were indeed about to wrest the authority for setting standards for phonetic symbolization from the IPA [Association].” Wholesale changes to the IPAphabet were proposed, and Jones was asked to secure the approval of the IPAssociation membership for them. While most of the changes were rejected, some were adopted, such as the symbols for clicks (since superseded), bilabial fricatives, and retroflex consonants. However, the greatest outcome was that the IPAssociation remained as the worldwide arbiter of phonetic transcription.

The IPAphabet has undergone several periodic revisions. Major ones took place in 1900 and 1932. The latest major revision was in 1989 at the Kiel Convention, organized solely to consider updates to the alphabet. It was considered that advances in speech technology and the discovery of several previously unknown sounds and sound types had made the existing IPAphabet out of date. Minor revisions have since taken place, in 1993 and 2005 (International Phonetic Association, 2005). It is a testimony to Jones’s expertise that his cardinal vowel system still largely represents the vowel section of the IPAphabet. For instance, in the 1993 revision, the symbols [ɘ, ə] were reinstated, having originally been proposed by Jones in 1933. A comprehensive description of phonetic symbols is given by Pullum and Ladusaw (1996).

Until it was superseded in 1971 by the *Journal of the International Phonetic Association* (<http://journals.cambridge.org/action/displayJournal?jid=IPA>), the association’s journal, entitled *Le Maître Phonétique* (or *m.f.*, for short), insisted on publishing articles written only in IPAphabet transcription. Articles in traditional spelling could only be published as supplements. Jones argued against this, pointing out that it was a hindrance to the journal’s articles reaching a wider audience.

The International Phonetic Alphabet, English Spelling, and Dictionaries

Given that English spelling is in general a poor indicator of the pronunciation, it is not surprising that most of the people involved in the creation and revision of the IPAphabet and other phonetic alphabets were native English speakers and writers. The Irish playwright George Bernard Shaw willed part of his estate toward a competition to produce a phonetic alphabet for writing English; unfortunately, the estate could only afford to publish one book, a Shavian alphabet version of his play *Androcles and the Lion*. Henry Sweet wrote a book entitled *The Principles of Spelling Reform* (1900). H. G. Wells, author of *The War of the Worlds*, was a vice-president of the Simplified Spelling Society (nowadays called the English Spelling Society, www.englishspellingsociety.org). Daniel Jones was a president of the society, and its current president is John Wells (b. 1939), former professor of phonetics at University College London.

Daniel Jones consistently used IPAphabet-based transcription beginning with his articles in *Le Maître Phonétique* in the early 1900s, and in his *English Pronouncing Dictionary*. The first edition of the dictionary was published in 1917. The 14th edition (1977) was edited by his successor as professor of phonetics at University College London, A. C. Gimson (1917–85), and established a set of phonemic symbols for English (often referred to as EPD 14 transcription) still widely used in British dictionaries. The current 17th edition is entitled the *Cambridge English Pronouncing Dictionary* (Roach, Hartman, & Setter, 2006). The *Longman Pronunciation Dictionary* (Wells, 2008) gives, besides broad English transcriptions, narrow phonetic transcriptions of the original pronunciation of foreign words, such as *genre*, English [ʒɒnrə], French [ʒɑːʁ].

The International Phonetic Alphabet Itself

It is clearly beyond the scope of this entry to describe the IPAphabet in any detail. Instead, the main features of the IPAphabet will be explained. This should provide the springboard for the interested reader to investigate it further, preferably with the help of a trained teacher.

The IPAphabet chart is given in Figure 1. The chart is adapted from the International Phonetic Alphabet (2005). To download the chart, see International Phonetic Association (2005).

Symbols for consonant sounds are divided into three. Pulmonic consonants involve an airstream coming from the lungs, and constitute the vast majority of consonant sounds in languages of the world. English has no non-pulmonic speech sounds. Three classificatory dimensions are shown. The place of articulation (where the sound is made) is represented by the different columns; for instance, the sounds [p, b, m], as in English *pie*, *buy*, *my*, are all produced by the two lips, and are thus called bilabial. The manner of articulation (how the sound is made) is shown by the rows; for example, the sounds [f, v, θ, ð, s, z, ʃ, ʒ, h], as in English *fine*, *vine*, *think*, *this*, *sue*, *zoo*, *ship*, *measure*, *hat*, are all fricatives, in that air escapes with a hissing noise through a small hole left between the articulators. The state of the vocal cords is shown by placing voiceless sounds (where the vocal cords are not vibrating) on the left of a cell, and voiced sounds (with vocal cord vibration) on the right; thus, the sounds [s, z] are the same, except that [s] has no vocal cord vibration, while [z] does.

As the note in the diagram explains, shaded areas denote articulations judged to be impossible. For instance, the glottal stop (as in a Cockney pronunciation of *better* [beʔə]) involves the two vocal cords coming tightly together. The vocal cords cannot at the same time be vibrating for voice. So only a voiceless glottal stop is possible.

Non-pulmonic consonants include various types of click sounds. In English-speaking cultures, they are used for paralinguistic effect, such as the *tut-tut* or *tsk-tsk* showing disapproval or annoyance, and the *gee-up* to a horse. However, in many languages of southern and east Africa, they are speech sounds combining with other consonants and vowels into words.

Other symbols for consonants include those that involve more than one simultaneous articulatory gesture. For instance, the [w] sound involves both a rounding of the lips (labial) and a movement of the tongue toward the soft palate (velar). All English speakers pronounce this voiced sound at the beginning of words such as *witch*, while many Scottish and southern US speakers distinguish this from its voiceless equivalent [ʍ] as in *which*.

The vowel chart is essentially the cardinal vowel system devised by Jones. It also uses three main classificatory dimensions. First, vowels produced with the highest point of the tongue toward the front of the mouth are shown conventionally on the left, and those toward the back on the right. Second, vowels produced with the tongue close to the roof of the mouth and with the teeth close together are plotted at the top, while those where the tongue is far from the roof, enabled by lowering the jaw and leaving a large space between the teeth, are at the bottom. Finally, vowels produced with lip rounding are on the right of a pair, with unrounded vowels on the left.

The suprasegmental section of the chart relates to those features that extend over more than one consonant or vowel segment. They include ways of marking stress, length, intonation (all found in English), and tones (found in tone languages such as Mandarin and Thai).

The final section gives various diacritics to be added to symbols to show particular phonetic features. For example, there is a burst of voiceless air (aspiration) when the [p] of *pie* is released; this can be shown explicitly by [p^haɪ]. The [t] sound is usually alveolar;

CONSONANTS (PULMONIC)

© 2005 IPA

	Bilabial	Labiodental	Dental	Alveolar	Postalveolar	Retroflex	Palatal	Velar	Uvular	Pharyngeal	Glottal
Plosive	p b			t d		ʈ ɖ	c ɟ	k ɡ	q ɢ		ʔ
Nasal	m	ɱ		n		ɳ	ɲ	ŋ	ɴ		
Trill	ʙ			r					ʀ		
Tap or Flap		ⱱ		ɾ		ɽ					
Fricative	ɸ β	f v	θ ð	s z	ʃ ʒ	ʂ ʐ	ç ʝ	x ɣ	χ ʁ	ħ ʕ	h ɦ
Lateral fricative				ɬ ɮ							
Approximant		ʋ		ɹ		ɻ	j	ɰ			
Lateral approximant				l		ɭ	ʎ	ʟ			

Where symbols appear in pairs, the one to the right represents a voiced consonant. Shaded areas denote articulations judged impossible.

CONSONANTS (NON-PULMONIC)

Clicks	Voiced implosives	Ejectives
◌͡ Bilabial	ɓ Bilabial	◌͡ Examples:
◌͡ Dental	ɗ Dental/alveolar	◌͡ Bilabial
◌͡ (Post)alveolar	ɗ̤ Palatal	◌͡ Dental/alveolar
◌͡ Postalveolar	ɠ Velar	◌͡ Velar
◌͡ Alveolar lateral	ɠ̤ Uvular	◌͡ Alveolar fricative

OTHER SYMBOLS

ʍ Voiceless labial-velar fricative	ɕ ʑ Alveolo-palatal fricatives
ʋ Voiced labial-velar approximant	ɹ Voiced alveolar lateral flap
ɥ Voiced labial-palatal approximant	ɟ̞ Simultaneous ʒ and ɣ
ħ Voiceless epiglottal fricative	
ʕ Voiced epiglottal fricative	Affricates and double articulations can be represented by two symbols joined by a tie bar if necessary.
ʡ Epiglottal plosive	

DIACRITICS Diacritics may be placed above a symbol with a descender, e.g. ɲ̥

◌̥ Voiceless	◌̤ Breathy voiced	◌̦ Dental
◌̥ Voiced	◌̤ Creaky voiced	◌̦ Apical
◌̥ Aspirated	◌̤ Linguolabial	◌̦ Laminar
◌̥ More rounded	◌̤ Labialized	◌̦ Nasalized
◌̥ Less rounded	◌̤ Palatalized	◌̦ Nasal release
◌̥ Advanced	◌̤ Velarized	◌̦ Lateral release
◌̥ Retracted	◌̤ Pharyngealized	◌̦ No audible release
◌̥ Centralized	◌̤ Velarized or pharyngealized	
◌̥ Mid-centralized	◌̤ Raised	◌̦ (ɹ̥ - voiced alveolar fricative)
◌̥ Syllabic	◌̤ Lowered	◌̦ (β̥ - voiced bilabial approximant)
◌̥ Non-syllabic	◌̤ Advanced Tongue Root	
◌̥ Rhoticity	◌̤ Retracted Tongue Root	

VOWELS

Where symbols appear in pairs, the one to the right represents a rounded vowel.

SUPRASEGMENTALS

ˈ Primary stress
ˌ Secondary stress
ː Long
ˑ Half-long
ˑ Extra-short
◌̥ Minor (foot) group
◌̥ Major (intonation) group
◌̥ Syllable break
◌̥ Linking (absence of a break)

TONES AND WORD ACCENTS

LEVEL	CONTOUR
˥ Extra high	˩ Rising
˥ High	˩ Falling
˥ Mid	˩ High rising
˥ Low	˩ Low rising
˥ Extra low	˩ Rising-falling
˩ Downstep	˩ Global rise
˩ Upstep	˩ Global fall

however, before dental sounds such as [ð], it can also be articulated as a dental sound with the upper teeth as the passive articulator, as in *out there* [aʊtðeə].

The International Phonetic Alphabet on the Computer

One of the main works on transcription is Abercrombie (1964). In it, he explained various dichotomies regarding transcription: simple versus comparative transcription, allophonic versus phonemic transcription, symbols versus conventions, and quality versus quantity transcriptions for certain English phonemes. Another criterion related to whether the symbols could easily be produced using a typewriter; this was important at that time, as many linguists carrying out fieldwork on languages carried typewriters with them to type up transcriptions. Nowadays typewriters have been replaced by portable computers, so this criterion has largely disappeared.

Nevertheless, the question of producing phonetic symbols on computer remained, as many phonetic symbols do not correspond to letters of the Roman alphabet. There were two main problems with this. First, researchers needed to be sure that the symbols could be produced not only on their own computer (usually by the downloading of an extra, phonetic font), but also on other computers, for example the computer of any other person they e-mailed documents to, or for PowerPoint presentations. Second, researchers needed to know what to type on the keyboard in order to produce the desired symbol.

Around 2003, the first problem was solved by the adoption of Unicode, a standard for the encoding of characters for the world's languages and for specialized fields like phonetics (Wells, 2007). Lucida Sans Unicode, supplied as standard on many computers, contains most common phonetic symbols. Freely downloadable Unicode phonetic fonts include Charis SIL, Doulos SIL, and Gentium (<http://www.sil.org>).

The second problem was resolved in various ways (outlined by Wells, 2007). A unique code number for each symbol may be keyed in, while holding down the Alt key (see International Phonetic Association, 1999, Appendix 2; Wells, 2010). A more user-friendly method is to download a virtual keyboard (University College London, 2009).

Conclusion

While the IPAssociation “exists to promote the study of the science of phonetics and the applications of that science” (International Phonetic Association, 1999, frontispiece), its chief product is without doubt the IPAphabet. It was originally devised in the late 19th century shortly after the founding of the association. Although Daniel Jones is well known as the popularizer of the alphabet, he was only five years old when the association was established, and considerable acknowledgment is due to Henry Sweet's Broad Romic alphabet.

Readers wishing to investigate the IPAphabet further should do the following. First, the *Handbook of the International Phonetic Association* (International Phonetic Association, 1999) (subtitled *A Guide to the Use of the International Phonetic Alphabet*) explains the alphabet, its history, its principles, and its use in much more detail than is possible here. It also contains IPAphabet transcriptions of passages from 29 languages; such specimen texts were a common content of *Le Maître Phonétique* and still feature in its successor, the *Journal of the International Phonetic Association*.

Second, phonetics is a tactile and auditory subject. For this reason, the best way to study is to learn from a qualified teacher. It has often been said that the best and most traditional way to learn the cardinal vowels is from someone who was trained by someone (who was trained by someone . . .) who was trained by Daniel Jones.

Finally, there are various Web sites containing information about the IPAAlphabet, some of them with clickable symbols with hyperlinks to sound files of the sounds.

Internationalization and Localization

REINHARD SCHÄLER

Internationalization and localization are two key steps in the preparation and translation of digital content for international markets and have formed part of the globalization strategies of multinational digital publishers since the mid-1980s. Internationalization is a prerequisite for localization and refers to the process of designing (or modifying) digital content and software so as to enable users to work in the language of their choice (i.e., allowing them to use their specific characters and scripts when using the software even if the software itself is not localized), and to isolate the linguistically and culturally dependent parts of an application in preparation for localization (so that these can be modified without interfering with the core functionality of the application). Localization then refers to the linguistic and cultural adaptation of digital content to the requirements and locale of a foreign market, and the provision of services and technologies for the management of multilingualism across the digital global information flow.

Bringing Digital Content to the World

The localization industry emerged in the mid-1980s, when US-based software publishers looked at ways to increase the return on investment for their original products by expanding into new markets which were ready to buy and use their products, then mainly office-type applications such as word processors and spreadsheets. The publishers found these markets in Europe and Asia, in the highly developed economies of countries such as Germany, France, Italy, Spain, and Japan, where a growing number of users of personal computers needed applications to run on their newly acquired hardware (Schäler, 2003).

In order to sell applications originally developed for the US-based market in these countries, however, publishers needed to adapt these applications to the needs and the requirements of the new users. The first companies to offer an adaptation service to digital publishers realized that what they were offering was very different from a straightforward translation service, that is, that they were offering a service that included translation, but had a much wider scope. Therefore, this service needed to be positioned differently, as a localization service. Over time, the demand for new products and more sophisticated localization services grew with the number of users of personal computers and, later, with the development of the Internet and the World Wide Web. Today, a wide range of digital content is being localized, from basic office applications to Web sites, from video games to the software controlling medical equipment. The number of publishers of digital content is growing and their business sustains a localization and translation services industry that was worth US\$25 billion in 2013, according to Beninatto and Kelly (2009). While this is a considerable amount of revenue, it is a fraction of the value that the localization service providers have created in financial returns for their clients, many of whom now generate more than 60% of their revenues from their international business divisions.

Table 1 Vectors of scalability and growth

<i>Vectors</i>	<i>Initial</i>	<i>Intermediate</i>	<i>Future</i>
Geography and languages	Europe	Asia	Global
Standards	Trial and error	Proprietary	Open
Content	Manuals/user interface	General technical	Any digital content
Rationale	Return on investment (ROI)	Investment	Rights-based
Medium of delivery	Documents and boxed products	CD-ROM	Online
Culture	Conventions	Values	Rights

Vectors of Scalability and Growth

The development of the localization industry can be captured by six vectors of scalability and growth: geography and languages, standards, content, rationale, medium of delivery, and culture (see Table 1). Each of these vectors points from an initial state to a future state, passing through an intermediate state that approximately captures today's situation.

Localization started in Europe and initially aimed at making manuals and user interfaces of software applications accessible to new users in their own languages, taking into account their cultural preferences and conventions such as date and time formats, number formats, currency signs, and collating sequences. The rationale behind this effort was to create an additional and almost immediate financial return on investment for the multinational developers of the original digital content. The localized content was transferred to diskettes and shipped as a boxed product. The effort that went into these early localization projects was immense: There were no agreed and widely used standards; digital content was often ill prepared for localization; localizers themselves were mostly learning on the job and had no access to formal training; the time (delta) between the release of the original language version of a product and that of the localized versions could be up to nine months; and publishers limited their localization efforts to their core products and around half a dozen languages promising the highest return.

The situation at the beginning of the second decade of the 21st century is dramatically different. With the development of the Internet and the World Wide Web, digital content has become ubiquitous for many people in the developed world. These people demand access to any kind of content in their own languages and according to their personal cultural preferences ("the person is the ultimate locale") as soon as the original content becomes available ("simship," i.e., the simultaneous shipment or release of the original and localized versions of a product). The type of digital content being localized today into up to 100 language versions ranges from software applications to Web sites, from video games to computer-based learning (Microsoft, 2007).

The implications of this growth in volume, number of languages, and content type are manifold and require increased automation, standardization, and interoperability; reuse of material; and the development of professional education and training programs for localizers.

Moving up the Value Chain: Internationalization

Internationalization is a prerequisite for localization. It is an activity that moves localization up the value chain, closer to the teams that design, develop, and author the content to be localized (Microsoft, 2010). Proper internationalization of digital content right from the start avoids the potential need for far more costly redevelopment work further down the line, when localization teams might discover problems preventing them from adapting the digital content to the requirements of different locales (e.g., country/language pairs such as Canada/French or Canada/English).

Digital content can be internationalized, even if there are no plans to subsequently localize it. There are two central aspects to internationalization, namely:

- The process of designing (or modifying) digital content and software so as to enable users to work in the language of their choice (even if the software itself is not localized). This includes the use of a universally recognized standard for the encoding of characters, that is, Unicode.
- The process of isolating the linguistically and culturally dependent parts of an application in preparation for localization. This includes, for example, the use of resource files with language-specific content that can be easily accessed, translated, and integrated into existing applications so that the language of the interface or content can be switched with minimum effort and without interfering with the core functionality of the application. Using this mechanism, the language of the interface of a spreadsheet, for example, can be easily changed without having any effect on the functionality of the formulas that calculate the values in the cells of the spreadsheet.

There are a number of ways to determine whether digital content has been internationalized. For example, specialized tools are available to check the code base or to ensure that characters have been encoded according to best practice (W3C, 2010). One of the central strategies to determine internationalization compliance is pseudo-translation. Original strings are automatically replaced with strings representing characters of the target language and are expanded by a certain percentage according to predefined algorithms in order to mimic a translation and to determine the effect this translation would have on a particular product. Pseudo-translation would, for example, highlight cases where “translated” strings are truncated or “cut off” and no longer fully visible because they expanded during translation and now no longer fit into the space originally provided for them.

The main strategies for pseudo-translation are

- adding leading characters to the start of each string,
- substituting one or more characters,
- adding padding characters, and
- adding trailing characters to the end of each string.

Using the appropriate technology, digital content can be pseudo-translated almost effortlessly into a variety of languages, where the algorithm uses different characters but the logic is the same:

English: Find at source and fix once for every language.

German: ößFind ät ßöürce änd fix önce för every länguägeAaBbCc Ddßö

Japanese: ソボFind 無t source 無nd fix once for every l無ngu無geAaBbCc Ddボソ

4 INTERNATIONALIZATION AND LOCALIZATION

Internationalization issues and defects that can be discovered using pseudo-translation include the following:

- *Externalization*: Long-established internationalization guidelines strongly encourage the separation of content visible to the consumer from the functionality of the platform, interface, or application that uses it. Strings should not be hard coded but externalized, that is, kept in a separate file that is then referred to by the actual code. Strings remaining in English following pseudo-translation have not been externalized, might be hard coded, and will require the attention of the original development team.
- *Expansion*: Strings often expand when translated from one language into another, especially if English is the source language. Pseudo-translated digital content can highlight the effect of translation on the layout, that is, a layout distortion, in the target language version of that content.
- *Corruption*: Applications that are not internationalized might not be able to handle characters and scripts of particular target languages. For example, some languages such as Japanese require double byte encoding (because of the number of characters or symbols that require unique code points to be assigned) when some applications can only handle single byte encoded characters (because they were never designed to work in other than Western European languages). Instead of displaying the characters expected, these applications display placeholders or alternative characters. By inserting characters of the target language into the digital content during pseudo-translation, this problem can be discovered early and easily, and before it can cause major problems during localization.
- *Concatenation and use of variables*: Developers often make use of concatenated strings and variables to improve the efficiency of their code, keeping the strings to be used by an application to a minimum. String concatenation, as well as the use of variables, makes assumptions about the structure of the language in which they are used and can often not be carried over into another language if this language requires, for example, a different word order, gender, or use of plural forms. For example, while in English a noun in the singular can usually be transformed into its plural form by simply adding an *s*, other languages such as German have many different ways of forming the plural version of their nouns. Pseudo-translated strings identify concatenated strings by marking the end and the beginning of individual strings. Concatenations must be referred to and resolved by the developers of the original content.
- *Other*: In addition to the above, pseudo-translation makes developers think about internationalization earlier; allows for the compilation of a complete file list to be worked on during localization; simulates the localization process, allowing for a verification of the file formats being dealt with and the build environment; supports more accurate project planning; and allows for a quick assessment of new languages.

Pseudo-translation allows for a quick and inexpensive internationalization test. Internationalization issues can thus be spotted early and be corrected even before localization starts. Localization issues are moved up the value chain, expensive testing of localized products can be significantly reduced, and issues can be identified in the source before they become expensive-to-correct problems in multiple language versions.

The Localization Process

The main stages of localization include project analysis, preparation, translation, engineering, testing, release, and project review. For a long time, translation has been the most

expensive of these stages, which is why most efforts were directed toward translation automation. The introduction of translation memory systems at the beginning of the 1990s brought the single biggest change to localization. These systems were the first building blocks used by multinational digital content publishers to develop “localization factories.” These are automated translation and localization platforms that hardly require human intervention, are capable of automatically processing up to 98% of content, and deliver file processing speeds of around 45 seconds per file (Jewtushenko, 2003). With the importance of machine translation (MT) in localization growing, translators are no longer required to translate source material but instead are asked to post-edit material that was pretranslated by hybrid automatic translation systems, including translation memory and machine translation systems.

Digital content providers are under significant pressure to reach a level of sophistication in task and process automation to produce more language versions of an increasing volume of digital content of acceptable quality while continuously driving down their cost base (Dunne, 2006a; Dunne & Dunne, 2011). They have recognized that existing tools and technologies need to be integrated on demand and become interoperable within a flexible, configurable, dynamic, and extensible translation and localization platform. While first instances of these platforms have been developed as bespoke and generic third-party systems, they still only partially cover the requirements for open standard compliance—for example, with the XML-based Localization Interchange File Format (XLIFF)—and for interoperability of component technologies, as well as for adaptable, flexible, and dynamic process management (workflow).

A localization process based on sophisticated translation and process technologies requires translators (or *localizers*) with a significantly different skill set than that supported by training courses in traditional translation studies (Schäler, 2007). As Locke (2003) points out, it is critical that academic course offerings are supplemented by professional certification programs such as those offered by the Institute of Localization Professionals (TILP).

Localization for All: Access to Information as a Human Right

One of the challenges of current mainstream internationalization and localization efforts is the need to become more inclusive. As an anonymous blogger (2008) on a well-known localization industry blog said: “Information should not be the right of those who speak a G-7 language.” Most of the localization decisions—that is, whether or not to localize specific digital content into specific locales—are based on financial criteria: Internationalization and localization have become an instrument of the economic globalization strategies of large multinational corporations, when the industry could take up the challenge to develop models that would allow them to extend their efforts beyond that of catering for purely commercial requirements (Schäler & Hall, 2005).

Access to information and knowledge in *your* language is now considered a fundamental human right (De Varennes, 2001) that is deeply rooted in the legal systems of many countries where it is considered to be as important as access to health care and other potentially life-saving services. While people in the northern hemisphere claim these rights for themselves, they do not always afford them to others, as there is a cost involved in the realization of these rights. At the same time, there is a *human* cost resulting from this denial of service which, in turn, results in life-threatening information poverty. Organizations such as the Rosetta Foundation are collaborating with organizations, industry associations, and initiatives such as the Globalization and Localization Association (GALA) and the Localization World Conference series, as well as with nonprofit organizations such as Health Information for All by 2015 (HIFA2015), to claim the right of access to information

in their own languages for those to whom this right has so far been denied because they cannot pay for it. Crowdsourcing—that is, strategies to involve the “crowd” in localization—and new technologies supporting collaborative localization and translation provide advanced support frameworks for these efforts.

Interpreting Techniques and Modes

BARBARA AHRENS

Interpreters provide communication between persons who do not speak the same language. They convert the message and the contents of speeches that are presented in one language into another language. The language of the original speech is called the source language, while the other language is known as the target language. In interpreting, speeches or segments of speech are also referred to as texts, i.e., the original speech is the source text and the interpreted speech is the target text. In spoken language interpreting, interpreters act on orally presented texts and deliver a spoken text in turn. In signed language interpreting, interpreting is done either between spoken and sign language and vice versa or between sign languages (Corsellis, 2008, pp. 3–4).

Interpreting does not imply a word-for-word rendering of the source text, but an idiomatic delivery of the original message in the target language in accordance with the linguistic and cultural conventions and norms of the target language. In specific settings, e.g., in court, accuracy and verbatim requirements may considerably influence the choice of target language wording (Hale, 2004, p. 3).

When providing this communicative service, interpreters can utilize different interpreting techniques and modes. The choice of mode depends on the situation and the setting, the degree of formality, the length of the speech (segments) that is (are) to be interpreted, and the availability of the technical equipment necessary for certain interpreting modes.

On the basis of their processing characteristics in general and the time flow of the source and target text presentation in particular, *consecutive interpreting* and *simultaneous interpreting* are the most general modes which can be distinguished. All other types of interpreting with their specific techniques fall into one of these two categories. Hybrid modes combine consecutive and simultaneous processing specificities. Also in signed language interpreting, the alternation of simultaneously and consecutively rendered segments can be observed, e.g., spoken into sign language (simultaneous mode) and vice versa (consecutive mode).

Consecutive Interpreting

Consecutive interpreting (CI) is the most ancient and natural form of interpreting, as it does not require any technical equipment. It has been practiced ever since people or communities of different cultures and languages have had contacts—whatever the purpose of these exchanges might have been (belligerent, peaceful, commercial, political, etc.) (Pöchhacker, 2004, p. 15).

In any form of CI, the target text is produced after the delivery of the source text. The source text can either be an entire speech or a passage of a long speech that is interpreted paragraph by paragraph. Source texts thus vary in length from one sentence or a few minutes up to 10 to 12 minutes (Kalina, 1998, p. 23).

In CI, the speaker delivers his or her speech in the source language. The interpreter listens and analyzes the incoming text, memorizes its message, partly through memory, and partly by taking notes. When the speaker finishes or pauses, the interpreter takes over and renders the message in the target language by retrieving the memorized information from his or her memory and notes.

2 INTERPRETING TECHNIQUES AND MODES

A consecutive interpreter needs sound analytical text-processing skills and has to be able to quickly detect text structures and argumentative patterns on the basis of logical links and connectors, as well as thematic progression. Additionally, he or she needs speaking skills since CI implies being present in the room, e.g., sitting at the same table with the delegation(s) or person(s) he or she is working for. Since CI is considered proof of analytical skills and interpreting strategies, CI is still an integral part of interpreter training at universities and interpreting schools (e.g., Sawyer, 2004) as well as of conference-interpreter accreditation tests of institutional employers such as the United Nations (UN) or national ministries (Ahrens, 2009, p. 364).

Memory plays an important role in CI. Most of the source text information is stored in medium-term mnemonic structures from where it has to be retrieved. Retrieval is supported and triggered by the interpreter's notes. During the delivery of the original speech, the interpreter is free to take notes using a special note-taking technique which is content-based instead of word-based. Note taking is a highly individualized tool since the way an interpreter records source text content depends on his or her own processing skills, general knowledge stored in long-term memory, familiarity with the topic, and his or her experience in CI. Note taking, however, is not an exclusive tool of conference interpreters; it is also used in any type of community interpreting, in court, etc. (e.g., Corsellis, 2008, p. 75; Kelly, 2008, p. 36).

CI techniques are often categorized according to the setting and situation where they are practiced: CI assignments with the delivery of long and formal speeches belong to the domain of conference interpreting, using CI on very official and high-level occasions, such as ministerial press conferences or after dinner speeches, when CI offers high-quality target texts as far as language and style are concerned.

But there is also the widely used "short consecutive" interpretation (Pöchhacker, 2004, p. 19), i.e., where shorter passages or even single sentences are to be rendered in the target language. Short consecutive can be done either with or without notes. Many interpreters tend to note down at least proper names and figures, even in very short passages. In short consecutive assignments, the interpreter often works in both directions—from the source into the target language and back—mostly without notes and in dialogic constellations, such as bilateral negotiations or liaison settings. Due to this bidirectionality, these CI forms are also referred to as bilateral interpreting (Pöchhacker, 2004, p. 16).

Short consecutive can be regarded as the typical mode for the most natural and ancient type of interpreting, which is called "community interpreting" (Longley, 1984, p. 178), but also "liaison interpreting" (Gentile, Ozolins, & Vasilakakos, 1996) or "dialogue interpreting" (Wadensjö, 1998, p. 50). It has been practiced—usually as face-to-face CI—since there have been contacts between different linguistic and cultural groups. In these types of interpreting, settings and situations define the interpreting technique applied. They have more of a conversational nature and are thus more interactive, such as in many community, social, or medical settings, where foreigners, migrants, and refugees, etc. require interpreting services for their conversations with the authorities, schools, physicians, etc. Because of the settings in which it takes place, this kind of interpreting is also called "public service interpreting (PSI)" (de Pedro Ricoy, Perez, & Wilson, 2009).

CI in community or PSI settings is characterized by intrasocial relations rather than international connections, such as the more or less institutionalized contacts between different linguistic and cultural communities living in one country (see the examples given in the foregoing). Nowadays, multiethnic societies are a common phenomenon all over the world; thus the need for intrasocial interpreting services is increasing. In countries with a long tradition of immigration, such as the United States of America, Canada, Australia, or Sweden—just to name a few—the need for interpreting has been acknowledged officially since the 1960s, whereas in other countries it took more time to raise awareness

for these matters (e.g., Pöchhacker, 2004, pp. 14–15). This is also true for signed language interpreting (e.g., Napier & McKee, 2010). Consecutive community interpreting not only requires linguistic and translational skills, but also a high degree of intercultural competence and awareness. This becomes particularly evident in cross-cultural medical encounters where the interpreter serves as an intermediary for both sides with their different languages and underlying cultural values, beliefs, and norms (Angelelli, 2004, pp. 18–25).

Although CI is practiced in most cases in face-to-face situations, a remote form of CI is telephone interpreting, which is provided for business and nowadays also increasingly in public service and medical settings. It requires sound CI skills including well-trained memory and note-taking skills because via the telephone, the source text segments can be rather long (Kelly, 2008, p. 36). In the conference-interpreting domain, conversations over the telephone are interpreted in the consecutive mode, too (oral communication given by interpreters from national ministries, January 2010).

CI in any setting offers several additional advantages and disadvantages besides language and style—which are of utmost importance on formal occasions. Because this mode does not require any technical equipment it can thus be used in any room or even in mobile settings when the interpreter accompanies a delegation or group of people. These are arguments which are especially important in times of budget constraints or for space reasons. In community-interpreting assignments, low remuneration, professional training, and professionalization continue to be a problem in many domains and countries, although an increasing number of training courses and awareness-raising measures are being offered nowadays (e.g., Roy, 2006; Corsellis, 2008; de Pedro Ricoy, Perez, & Wilson, 2009).

Due to the interpreter's consecutive performance of target-text segments after the delivery of source-text segments, CI is a time-consuming mode since the delivery of the target text requires additional time. Therefore, it is an interpreting mode which is only used when two working languages are involved, e.g., at bilateral meetings. With regard to the time spent in meetings, consecutive interpreters are often asked to deliver a target language summary of the source text.

Simultaneous Interpreting

Simultaneous interpreting (SI) is considered to be the most spectacular interpreting mode since the interpreter listens and speaks at the same time, i.e., the target text in SI is an immediate rendering of the source text message. Due to its time-efficiency, it has become the dominant interpreting mode for international—and thus multilingual—meetings, such as for example those held at the UN. SI is considered to be the mode representing conference interpreting at its best. Nevertheless, simultaneous processing of the source and the target text can also be found in specific forms of SI used in settings other than conference interpreting.

Generally speaking, SI requires technical transmission equipment and a soundproof booth for the interpreters. The source text is presented via a microphone; the sound is transmitted into the booth where the interpreters listen to the text via headphones. While the interpreter is listening to the incoming source text in the original language, he or she starts producing the target text in the respective target language. The interpreter in the booth speaks into a microphone and the target text is transmitted to the audience of the interpreted text in the conference room. The audience listens to the interpretation via headsets, thus, in SI, the audience of the original speech and the audience listening to the interpreted version can sit in the same room and receive their respective texts at the same time—simultaneously!

Simultaneous interpreters work in teams of two or three interpreters per booth, according to the length of the meeting and the complexity of the topic of the conference. They

4 INTERPRETING TECHNIQUES AND MODES

take turns of approximately 30 minutes per interpreter because of fatigue, loss of concentration, and limited cognitive resources from which they have to recover during a colleague's turn of 30 minutes.

Simultaneous interpreters listen to and analyze the source text by segmenting it into meaningful chunks, i.e., they store incoming elements in their short-term memory until they build up a meaningful chunk of information that can be uttered in the target language while continuing to listen and analyze the subsequent elements of the source text. Both CI and SI are not mere "parroting" or a word-for-word rendering of the source text, but involve strong cognitive effort in order to grasp the source-text message that has to be communicated in the target language. Due to the time they need for source-text analysis and segmentation of meaningful chunks, simultaneous interpreters work with a time lag, the so-called "ear-voice span" (Goldman-Eisler, 1972, p. 128). This is the time that elapses between the first element of a source-text chunk and the start of production of this very chunk in the target language. Experiments have shown that the average ear-voice span is 4–5 words or 2–3 seconds (e.g., Lederer, 1981, p. 290), but it is an individual parameter that might vary due to the density and complexity of incoming chunks, proper names and figures, the interpreter's familiarity with the topic and the speaker, his or her experience in SI, or his or her fatigue, which means that the ear-voice span is not fixed at a determined value, but varies during the course of a speech.

As SI requires technical equipment for the transmission of the acoustic and visual signals of the source and the target text, it can be performed over long distances. In addition to the traditional conference setting where the booths are in the conference room with a direct view of the speaker(s) and the audience, there are also so-called remote interpreting settings where the interpreters are not in the same room with the speaker and the audience; and under extreme circumstances, the speaker and the audience might also be at separate locations. Nowadays, video-conferencing technology can integrate SI equipment for the simultaneous interpreting of video conferences (Brähler ICS, 2011). Research and developments in this field of SI have been triggered by technological progress and pressure on conference budgets, etc. (Braun, 2006, pp. 6–7). The setting and the technology used in video-conference interpreting have to fulfill certain technical standards in order to guarantee the sound and picture quality required for SI (AIIC, 2002). The latest development in SI is the use of Internet technology in order to offer SI online via the World Wide Web (Lang, 2009).

One special type of SI is simultaneous interpreting in the media, as practiced nowadays during live broadcasts of important political, cultural, or sports events (Kurz, 1997, pp. 198–202). Media interpreting imposes special requirements for interpreters with regard to their resistance to stress, spontaneity, speed, as well as flexibility and tolerance in dealing with sometimes difficult technical conditions and, occasionally, unusual working hours (Kurz, 1997, p. 196). Moreover, television networks and TV editors expect a mode of speaking on the part of the interpreter that is "media-oriented," i.e., it should be similar to that of trained moderators and speakers in the media (Kurz, 1997, p. 203).

Another variant of SI is simultaneous interpreting with a written text. Here the interpreter in the booth has a written manuscript of the speech in the source language, but this document is always subject to the premise that it has to be checked against delivery, because speakers may deviate from their prepared texts. As a comparison of the written text and the acoustic input represents an additional requirement during the comprehension and analysis phase in the SI process, SI with a written text represents an especially complex form of SI.

Even if SI generally requires the corresponding conference technology and is, therefore, also referred to as "booth interpreting" (Kade, 1967, p. 9), it is also applied in situations in which no booth is available (e.g., for space or cost reasons). This form of SI is known

as whispered interpreting (*chuchotage*), where the interpreter works simultaneously without a booth by whispering the interpretation directly into the listener's ear. Whispered interpreting is a form of SI which is also often practiced in community-interpreting settings or in court, e.g., in order to speed up procedures (Corsellis, 2008, p. 25). This special form of SI is very taxing physically, as the interpreter is directly exposed to all of the acoustic influences and disruptive factors in the room and frequently even has to assume an uncomfortable posture behind or next to the person listening to him or her. For this reason, whispered interpreting is only feasible for one to two listeners. If the number of listeners is larger, SI with booths should be used. Whispered interpreting is also partly practiced using a wireless system comprising headsets and a microphone for the interpreter, which was originally developed for plant tours, etc., but which is also used in SI settings (frequently because of a presumed pressure to economize) (Farwick, 2009, pp. 45–6). However, it absolutely cannot replace the customary simultaneous interpreting booth. Whispered interpreting, with or without a wireless system as described in the foregoing, cannot adequately replace either real SI or CI and is accepted by interpreters only under certain circumstances, as a rule (e.g., lack of space, very small number of listeners, etc.).

Hybrid Manifestations of Interpreting

By hybrid manifestations of interpreting we mean those techniques during which the source text is not presented orally or through sign language but in writing, or which can be characterized by a mix of the previously described modes of consecutive and simultaneous interpreting. As far as the alternation of different forms of CI and SI is concerned, both court interpreting and signed language interpreting can be considered hybrid modes.

With sight translation, the source text is solely available in writing, in contrast to SI with a text. From a written text, the interpreter formulates the target text while simultaneously reading the text, quasi in real time. In other words, this technique is similar to SI.

Another hybrid form is known as “simultaneous consecutive interpretation,” where the reproduction of the interpreting is done consecutively; but the interpreting technique is simultaneous because the interpreter is not interpreting on the basis of his or her memory and note taking, but on the basis of a recording of the source text. With this technology-assisted interpreting mode, the interpreter records the source text on a digital voice recorder during the presentation and listens to it by means of a small headphone while simultaneously interpreting this speech into the target language (Ferrari, 2007). In terms of the time flow of the source- and target-text presentation, simultaneous consecutive is a consecutive mode, which explains its hybrid character. Even if this mode is viewed as being a guarantee for the completeness of the interpretation for certain fields of application, such as at court (Camayd-Freixas, 2005, p. 40), tests of this mode have tended to show drawbacks in comparison with traditional CI (Pöchhacker, 2007).

Court interpreting is a form of interpreting which holds a special position within the modes of interpreting, owing to its special characteristics. In addition to aspects such as the legal basis and the formal requirements in the respective legal systems, the statutorily defined role of the interpreter or the language pairs required (e.g., González, Vásquez, & Mikkelsen, 1991; Hale, 2004), it is especially the mix of interpreting modes which makes interpreting in court such a challenge. Depending on who needs an interpretation at any given moment, the interpreter whispers, then interprets consecutively or provides a sight translation (e.g., when documents are being presented) (Driesen, 1985, p. 36). The rapid alternation of mode requires high concentration and a certain familiarity with the modes in question. With the exception of international courts, such as the International Criminal Court or the European Court of Justice, at which SI is used, court interpreting at national

courts can be classified as a hybrid form, as different modes are used in constantly alternating sequences.

As already mentioned above, signed language interpreting is provided simultaneously when sign language is the target language. When interpreting into spoken language, the target text can either be delivered consecutively or simultaneously (Corsellis, 2008, pp. 3–4). In the latter case, it could be done by whispering if only one or two listeners are present. If more people need simultaneous interpretation into spoken language, the interpreter will have to use a wireless system comprising a microphone for the interpreter and headsets for the audience.

Interviews

DEBBIE G. E. HO

The interview is one method applied linguists use to explore language-related problems. Most interviews are carried out as conversations between people, including the researcher and a respondent whose beliefs, opinions, attitudes, and feelings are relevant to the language issues investigated. Interviews are typically used in exploratory and qualitative research to gather data about beliefs of individuals or groups, but different types of interviews are used for different purposes, including data collection in quantitative research.

Types of Interviews

Broadly speaking, three types of interviews are used in applied linguistics research: the structured, semi-structured, and unstructured interview (see Table 1, which highlights their characteristics). In the structured interview, the researcher decides upon the questions in advance and the interview adheres strictly to a script. The structured interview thus provides for the most robust test of a hypothesis. For example, the question “How many languages do you speak?” might be asked in a structured interview on multilingualism. The advantage of structured interviews is that they can be efficient and suitable for a large sample. The recording of relevant information can be accomplished without time-consuming transcription, and the data are easy to analyze. The reliability of the administration is not difficult to arrange with a trained interviewer, in the sense that all respondents are asked the exact same questions and given similar clarifications. The consistency in the research procedure serves to minimize influence from both the interviewer and the research instrument, thus increasing the probability of producing reliable findings. Respondents’ anonymity can be easily guaranteed in structured interviews if a large sample is used. On the other hand, there are clear disadvantages to such interviews: they produce only simple descriptive information, and they can fail to obtain any depth and individuality in people’s perspectives or viewpoints due to the structured responses they elicit.

A semi-structured interview addresses this problem by allowing the interviewer some room for improvisation by following up respondents’ responses to the fixed questions. After asking for languages that a respondent speaks, for example, the interviewer may ask, “Do you have specific times that you use each language?” to encourage the respondent to reveal more about the relative role of each language in his or her life. Answers to the follow-up question could provide information about the relative strength and importance of each language to the respondent. This form of interview is most common in qualitative work where there is a desire to hear what respondents have to say on topics or areas identified by the researcher. Examples of such interviews can be found in Kvale (1996) and Ho (2006). The most diverse and common type of interview, the semi-structured interview has several advantages, such as the reliability of obtaining specific types of information from respondents and allowing for freedom to stray from a rigid script or schedule. It allows for improvisation on topics to be explored, particularly things which are of interest to all parties concerned. One difficulty with the semi-structured interview is in analysis. It is more difficult to achieve a “reliable” analysis of open-ended responses as the interviewer may need to explain some questions to some respondents but not all.

2 INTERVIEWS

Table 1 Types of data and corresponding interview types

<i>Type of data</i>	<i>Interview types</i>	<i>Interview characteristics</i>
<i>Quantitative:</i> • Data can be labeled and categorized clearly. • Data are easily subjected to statistical analysis and inference frequently follows. • The focus is on trends of whole samples rather than a detailed study of a few cases.	• Structured interviews.	• The interview is usually used for gathering basic background information, e.g., age, educational level, gender, age, etc. • A “positivist” approach, i.e. that there are objective facts out there to be discovered through robust study leading to generalizations and laws explaining a phenomenon. • The interview schedule is fixed and rigidly followed. • Respondents are expected to answer only what is asked. • Data are analyzed to produce numerical summaries.
<i>Qualitative:</i> • Data are in the form of complex stories, images, description. • Data are not easily labeled or categorized. • Data are often not open to generalizations.	• Semi-structured and/or unstructured interviews. • Open-ended questions.	• The interview yields complex data. • The emphasis is on subjectivity involving respondents’ subjective perspectives, feelings, etc. • The analysis can be complicated. • Conclusions reached may be open to criticism, further discussion, etc. • Respondent’s perspective is, however, confined to items selected by the interviewer. • There is no explanation of the respondent’s input, but only those selected by the interviewer in advance.

Finally, compared to structured interviews, individuals in semi-structured interviews might be easily identifiable, which compromises the assurance of respondents’ anonymity.

The latter two issues are also challenges for the unstructured interview, which is also known as naturalistic, intensive, autobiographical, in-depth, narrative, or nondirective (Holland & Ramazanoglu, 1994). The unstructured interview is based on a list of broad topics or themes and is explorative in nature. The direction it takes is largely set by the respondent. Respondents, for example, could be led into relating a story or an event through a question such as, “I hear that students at this school often play jokes on the English teachers. Have you ever done this?” The interviewer uses a prompt which consists of a list of possible topics to be explored. An example of the unstructured interview is ethnographic interviewing (Atkinson, Coffey, Delamont, Lofland, & Lofland, 2002). In applied linguistics, this data collection method is most often used early in a study as a means of generating a script for subsequent semi-structured interviews. Other examples of unstructured interviews can be found in Lutterall (1997) and Whyte (1943). In an unstructured

interview, the most important consideration is to obtain rich information about the topic rather than consistency in administration and data analysis. Therefore, reliability in elicitation and analysis of respondents' responses is not the goal. Further readings on the issue of reliability and validity in interviewing can be found in Minichiello, Aroni, Timewell, and Louis (1990), and Seidman (1991), and Burns (2000).

The main advantage of an unstructured interview is that it allows the researcher to hear the issues that the respondents raise and their own words as they describe their beliefs and perspectives. Researchers conducting unstructured interviews seek a nonpositivist view of social science knowledge which is able to provide findings that are different from those provided by other types of studies. However, such researchers also face a number of challenges. First, transcribing an unstructured interview can be time consuming. It is more difficult to gain commitment from respondents because such interviews can be quite lengthy. Added to this is the difficulty of ensuring respondents' anonymity due to the small sample size typically used in such studies and the distinctive features that lie in the data. These make it easy to identify individuals in the report. Informants may also express their perspectives using measured words in view of their understanding that they may be identified. When more than one respondent is interviewed at a time, researchers can conduct a focus group interview. The focus group format can include about eight to ten respondents. The aim is not so much to gather facts from individuals, but to explore the range and depth of "shared meanings in an area" (Gubrium & Holstein, 2002, p. 58). The idea is that public opinion can be solicited more effectively in an environment where respondents are encouraged to communicate with one another through conversation.

Interview Tools

The guiding framework for structured and semi-structured interview investigation is the interview schedule that is drawn up prior to the actual interviewing. The interview schedule is a list of all the questions the researcher believes are useful for obtaining information about the event or phenomenon under study. A good starting point to designing an interview schedule can be found in Lofland (1971). The questions included in the interview schedule are those that may have either direct or indirect bearing on the research. The questions are sorted and discarded accordingly based on relevance and time constraints.

The type of questions included in the interview schedule may consist of closed and open-ended questions. Closed questions are more restrictive and they limit the range of possible responses. In contrast, open-ended questions act as triggers to motivate respondents into talking freely about the topic under discussion. Open-ended questions are more appropriate if the goal is to collect information about people's experiences and opinions. However, the value of such open-ended questions in a structured interview is "double-edged" (Arksey & Knight, 1999). Because responses to open-ended questions can be long and detailed, they can prove difficult and time consuming to analyze.

Another interview tool is an interview guide, which is often used for semi-structured and focus group interviews. The design is similar to the interview schedule but typically includes more open-ended questions in order to promote communication. Since the goal is to probe and prompt responses, clarification, and elaboration, the interview guide includes both core questions and prompts that can be used as follow-up questions to generate more complete and in-depth responses. The guide also includes techniques for returning to more neutral ground following personal or emotionally charged topics. The interview guide often concludes with questions that allow respondents to add to the information that has already been disclosed. For a detailed overview of steps in conducting successful interviews, see Burns (2000).

4 INTERVIEWS

Although there is an association between interview type and question type, it is not an exclusive relationship. Closed questions, for example, are often asked even in unstructured and semi-structured interviews, particularly in collecting background information. And an open-ended question may be asked in a more structured interview.

Ethical Considerations

Interviews involve ethical issues that must be considered, particularly the need to protect the rights of the participants. One of the main ethical considerations is to obtain the respondent's consent. Voluntary participation should always be sought and the researcher should keep in mind that respondents have the right to withdraw at any time. Consent may be needed at more than one level when institutions or some populations are involved. For example, a researcher may obtain consent from a school administrator, but this does not necessarily imply that consent from the teachers or students in that school can be assumed.

Another ethical consideration that frequently arises is how much information should be given and when. Sometimes, providing detailed information about the research topic in advance of the interview can affect participants' responses. If this is the case, then any vague or misleading information should be corrected in a debriefing session. Confidentiality is also an ethical concern in interview research as the participants' identities can be revealed through their answers, particularly in semi-structured or unstructured interviews. To ensure confidentiality, data that identify the respondents in any way should not be reported. If the study contains information that is potentially recognizable to others, then consent for publication must be obtained. Protecting the privacy of participants through the use of fictitious names and concealing identifying features are important issues in the reporting of interviews, as a breach of confidentiality could lead to undesirable ethical and legal consequences.

Interviews in Qualitative Research

KATHRYN ROULSTON

Interviews are social interactions in which researchers ask questions of people for the purpose of collecting data for social research. Research interviews are a subset of a larger group of interactional events called “interviews,” all of which are characterized by question–answer sequences. These include clinical interviews, counseling interviews, forensic interviews, job interviews, and journalistic interviews. Social science researchers have used interviews for many decades to study language, language use, and language learning—topics central to applied linguistics. Applied linguists have incorporated qualitative interviews in research designs, including case studies, mixed methods studies, oral and life history studies, and ethnographies to examine language use and experiences of language learners. Unlike studies in which researchers use quantitative methods to analyze interview data (e.g., studies of language variation or dialect atlases), studies using qualitative interviews focus on examining peoples’ experiences, perspectives, and meaning making. While interviewers conducting standardized surveys ask questions in predefined sequences and participants’ responses are guided by preestablished coding schema, qualitative interviewers take a less structured and more open approach to asking questions and discussing research topics with interviewees. Interviewers guide talk via semi-structured interview guides, and talk is more open-ended or conversational in nature. Whereas standardized survey interviewers must ask the same questions in the same sequences to multiple participants, qualitative interviewers emphasize individual participants’ meaning making with a view to generating *etic* or “insider” descriptions of lifeworlds. Therefore, qualitative interviewers follow up on participants’ talk by asking further questions that generate varying descriptions among individual participants.

Forms of Interviewing in Qualitative Research

Although researchers frequently use the term “qualitative interviews” generically to describe interactions in which question–answer sequences are used to elicit information about informants’ lives, opinions, attitudes, and experiences, more specific terminology has developed in methodological literature to describe various forms of qualitative interviewing. The focus group is one form of group interview that is widely used in social science research. Common types of individual interviews include phenomenological, ethnographic, feminist, oral, and life history interviews. While these labels are discussed separately for heuristic purposes here, in practice labels overlap and are often used in complementary and interchangeable ways. For example, researchers might combine terms to describe a research design (e.g., “feminist ethnography” and “narrative life history”).

Phenomenological Interviews

Phenomenological interviews are informed by an interest in generating data that describe human experience in rich, detailed, and nuanced ways. Developed by Edmund Husserl (1859–1938), phenomenology as a philosophical approach to examining the essential aspects or “essences” of human experience has developed into diverse strands. Some researchers situate their use of phenomenological interviews within these respective traditions—such

DOI: 10.1002/9781405198431.wbeal0572

2 INTERVIEWS IN QUALITATIVE RESEARCH

as Husserl's transcendental phenomenology or Martin Heidegger's (1889–1976) hermeneutic phenomenology. Others view any open-ended qualitative interview as “phenomenological” in intent, when defined as focusing on aspects of “human experience.” If the purpose of a qualitative interview is to develop deep understanding of participants' experiences, understandings, and meaning making, then much qualitative research relies on phenomenological assumptions even if these are not made explicit in research design statements. Researchers who use interviews informed by phenomenology stress the importance of asking open-ended questions of participants that provide opportunities for them to give detailed descriptions of particular experiences and the meanings ascribed to those experiences, for example:

Think of a time when you have experienced _____, and describe that for me.

The interviewer takes the role of a neutral coresearcher who assists interviewees to freely articulate lived experiences with little input or comment from the interviewer. Well-placed follow-up questions elicit further description of the event or experience that is the focus of inquiry. Christine Sorrell Dinkins (2005) has described innovations to the phenomenological interview in which the interviewer uses a Socratic approach to question participants in order to elicit the reasoning for their answers, rather than simply focusing on generating descriptions of their experiences. Here, the interviewer plays a more active role in following up on participants' responses and questioning, rather than accepting at face value interviewees' reports.

Ethnographic Interviews

Ethnographic interviews draw on many decades of practice described by anthropologists and sociologists in which researchers spend extended periods of time in field settings observing events and activities in naturalistic settings, participating in various cultural events, collecting various forms of data such as documents and artifacts, writing field notes, and talking to participants. In ethnographic traditions, the researcher's lengthy participation in research sites, as well as his or her reflections and questions about scenes, activities, and actions observed informs how questions are asked, and what topics are discussed. In addition to informal interviews and conversations, researchers may also arrange more structured, formal interviews. Both informal and formal ethnographic interviews may be conversational in style, yet questions posed are formulated in relation to the phenomenon of inquiry (e.g., Spradley, 1979). For example, researchers may want to learn about how events and activities routinely unfold, or what folk terms are used by members of a community, through questions such as:

Tell me about a typical day for you.
Tell me how you usually do *x*.
What words do you use to describe *y*.

Doris S. Warriner (2007) provides an example of how informal and formal ethnographic interviews with participants—in this case, students, teachers, and administrators—might be combined with participant observation in her ethnographic study of language learning of women refugees in an adult ESL (English as a second language) program.

Feminist Interviews

Feminist interviews have been developed and described over the past 30 years, and stem from a focus on addressing women's experiences through the lens of feminist theories

(e.g., Hesse-Biber, 2007). Feminist research is characterized by the use of a variety of interview forms, including life history, narrative, conversational and ethnographic interviews, or focus groups. What distinguishes an interview as “feminist” is the focus on developing ethical relationships with women and doing research that forwards feminist agendas. Sociologist Marjorie DeVault (1990) proposes a number of feminist interviewing strategies, including exploring women’s terms and categories, rather than those imported to the interview setting by the researcher; listening sensitively for moments within interviews in which women do not fully articulate their experience and pursuing these in greater depth; representing women in respectful and ethical ways in reports; and writing up research findings in ways that may be understood by audiences new to feminist agendas.

Oral and Life Histories

Oral and life histories have long been used by historians to record people’s life experiences and chronicle events (Ritchie, 2003). In this form of interview the researcher elicits stories from participants providing details of their lives and events relevant to the research topic. Researchers who value realist accounts may use documentary data to check the facts provided by participants in order to validate the truthfulness of descriptions. In contrast, qualitative researchers using postmodern perspectives are more likely to focus on social justice issues rather than a search for “truth,” and use multiple theoretical perspectives—such as critical and feminist theories—to analyze oral histories (e.g., Janesick, 2010). Exemplifying how life history interviews can inform the study of language, Sandra Kouritzin (1999) examined first language loss through a multiple life history case study. This study presented data in the form of individual life histories, in addition to a cross-case analysis of data, demonstrating two forms of analysis and representation common to narrative inquiry. Julia Menard-Warwick (2007) also used life history interviews in her ethnographic study of identity and second language learning. Data analysis involved coding to identify central themes, as well as discursive analysis of a narrative to examine performances of gender.

Designing Qualitative Studies That Use Interviews

A number of steps are involved in designing studies that employ qualitative interviews. These include (a) ensuring that interview data are well suited to examination of the research questions posed, (b) considering criteria for sampling and participant selection, (c) developing an interview guide with questions aligned with the interview tradition selected, (d) gaining approval for human subjects research and considering ethical issues, (e) recruiting participants and scheduling interviews.

First, qualitative interviews are used by researchers working from a range of theoretical traditions (e.g., interpretivist, emancipatory or critical, and deconstructive or poststructural), using a variety of research designs (e.g., case study, ethnography, participatory action research, life history, narrative inquiry, and so forth). When selecting methods, *researchers must ensure that the data generated will be effective in responding to questions*. For example, a research question that focuses on *how* people accomplish certain activities and actions could be examined via naturalistic data which demonstrate the phenomenon of interest in situ. Participants’ interview descriptions will provide recollections about activities, rather than data about *how* the activity is accomplished. Qualitative interviews are well suited to examining research questions that focus on participants’ meaning making, reflections on experiences, life stories, and perspectives of activities and events.

Second, research proposals describe the *selection and sampling methods* used by researchers to specify the criteria by which a specific population is chosen for inclusion in a study, as well as how potential participants will be sampled. Since qualitative interviews are time

4 INTERVIEWS IN QUALITATIVE RESEARCH

intensive both in terms of conducting interviews and transcribing and analyzing data, qualitative studies are likely to have fewer participants than large-scale studies involving national samples. There are a variety of criterion-based sampling strategies commonly used by researchers using qualitative interviews (see LeCompte & Preissle, 1993). These include snowball or network sampling in which succeeding participants assist with identifying potential participants, reputational case sampling in which the researcher seeks recommendations from experts or gatekeepers in a community, or theoretical sampling in which participants are recruited to further examine a particular phenomenon identified in initial fieldwork. Researchers make decisions with respect to selection and sampling criteria in conjunction with deciding on the projected numbers of participants, as well as duration and number of interviews. Decision making is informed by the cost and time line for a project and the resources needed to complete it.

Third, *initial interview guides* are prepared during the design phase of a study. Researchers formulate questions with reference to the form of interview selected (e.g., phenomenological, ethnographic, oral or life history, or feminist) and relevance to the research questions posed. It is a useful step to project the kinds of information anticipated in response to specific interview questions and check if the hypothesized data respond to the research questions. Researchers frequently test interview guides in pilot studies to discover whether interview questions are effective and how they might be revised. In this phase, it is worthwhile examining if participants make sense of questions in the ways that interviewers intend.

Fourth, although specific procedures vary across countries, researchers seek *institutional approval for research involving human subjects*. This invariably involves submitting a proposal to the human subjects review board of the researcher's university (in the USA, these are called Institutional Review Boards). In the case of studies that involve other institutions such as courtrooms, hospitals, or schools, researchers also seek approval for research from administrators or review boards within the specific community. Ethical issues to be dealt with in interview research include adequate explanation of the purpose of research projects to potential participants ("informed consent"), safeguarding data, and ensuring confidentiality of participants' identities. Other issues—such as representation of participants, dissemination of findings, handling data that are potentially harmful to participants, or reporting information concerning participants' activities that cause concern (e.g., an adolescent's report of self-harm, or abuse)—may arise in research projects in relation to specific topics, settings, and participants. Researchers must give careful thought to these issues in order to respond sensitively on a case-by-case basis.

Fifth, once institutional approval for a study has been obtained, researchers must devise steps to *recruit participants and schedule interviews*. The methods by which participants are recruited will vary considerably according to the research design of the study. For example, in ethnographies, participants might be recruited personally by the interviewer after some months of participant observation. In a study in which interviews are the sole method of data collection, a researcher might invite participants via a notice on an electronic listserv, by placing fliers in public spaces, or by advertising in newspapers. In some settings, effective recruitment relies on the recommendation of a knowledgeable gatekeeper in a community, and researchers may need to spend considerable time in relationship building prior to conducting interviews. Once participants have been recruited, the researcher must schedule interviews at a mutually agreed-upon location. Researchers commonly use digital equipment to audio record interviews, and it is useful to avoid scheduling interviews in public spaces, since external noise inhibits the production of high-quality recordings. It is important for interviewers to double-check recording equipment prior to interviews, have extra equipment at their disposal in case of failures in technology, and to become familiar with the technologies required to record, download, transcribe, and safeguard the storage of audio files and transcriptions for later retrieval.

Conducting the Interview and Asking Questions

A “good” interview is commonly understood as one in which participants are forthcoming and cooperative in their engagement with interviewers. Numerous methodological descriptions of how to formulate and ask questions recommend that qualitative interviewers ask open questions, allow sufficient wait time for participants to answer, follow up responses with thoughtful probes to elicit further description, and listen respectfully to participants. For interviewers using semi-structured and unstructured formats that seek participants’ narrative descriptions, “probes” or follow-up questions of the following types are helpful in eliciting elaboration of prior talk:

- You mentioned _____, tell more about that.
- You mentioned _____, how do you define that? *or* what does that mean to you?
- You talked about _____, could you describe a specific example of that?
- You’ve told me about _____, what was that like for you?

Interviewers might also clarify their understandings of participants’ talk via closed questions, such as:

- Would I be correct in saying that _____?
- I’ve understood you to say that _____. Is that right?
- Would you agree that _____?

Interviewers must also reflect on their subject positions in relation to the research topic and research participants so that they can adequately prepare to ask the kinds of questions that might be discussed with participants. For example, researchers conducting interviews about topics with which they are very familiar—“insider research”—run the risk of understanding participants to such a degree that they fail to elicit sufficient description, since achieving mutual understanding relies less on talk than it does on background knowledge of the topic. On the other hand, researchers examining topics in settings in which they are “outsiders” may need to prepare intensively for interviews in order to know what questions might be asked and how to ask them.

Researchers must negotiate differences in culture, gender, ethnicity, age, status, and nationality—among many possible subject positions—in order to use qualitative interviews effectively with members of groups to which they do not belong. Given the huge variety of topics that researchers explore, and the infinite number of differences that potentially exist between researchers and participants of their studies, it is useful for interviewers to examine who they are in relation to the research topic and potential participants (for an example of this kind of discussion, see Warriner, 2007, pp. 311–12). Interviewers can access much advice on conducting cross-cultural interviews, and how researchers might work with groups with whom they do not share category membership (e.g., in terms of race, culture, ethnicity, language use, status, gender, health or disability, age, sexual orientation, etc.) (see Gubrium & Holstein, 2002). This is a complex issue that must be examined throughout a project, since interviewers sometimes find that even though they share a category membership with a participant (e.g., race or gender), participants may not be forthcoming in interviews because they orient to another category membership (e.g., status or education).

Issues in Conducting Interviews

In addition to seeking information and descriptions from participants, some researchers have aimed to engage participants in critical discussion of topics with a focus on

challenging or transforming participants' understandings (Freeman, 2006; Brinkmann, 2007). The impetus for this approach to interviewing is to stimulate reflection and critical inquiry within the interview setting, rather than regard interviews as simply a way to collect facts and descriptions from participants. Given that there has been a long history of social science research that has used interviews of all forms to do just that, there are few examples of research that indicate how dialogic approaches to interviewing unfold in practice and how research designs might invite participants to participate in emancipatory agendas instigated by researchers.

Researchers have also made use of the growth of the use of information and communications technologies globally to use *telephone and online modes of communication to conduct interviews*. Because new technologies offer a multiplicity of ways to talk to participants, researchers must consider a range of complex issues in relation to research design and ethics. Interviewers might conduct interviews via asynchronous (e.g., e-mail) or synchronous tools (e.g., chatrooms or instant messaging; Salmons, 2010). Researchers have conducted interviews face to face using Voice over Internet Protocols (VoIPs) such as Skype™, or using avatars in a massive multiplayer universe (MMU) such as Second Life (see James & Busher, 2009, for further discussion of theoretical issues involved in online research). While researchers expand the possibilities for recruitment of participants through use of online modes of communication, use of these interfaces complicates research by provoking questions about what counts as “real,” and the evidentiary status of data gained from participants who the researcher might never meet in person. Different modes of communication both afford and limit interaction between interviewers and participants. For example, asynchronous formats such as e-mail provide opportunities for participants to think carefully and reflect before responding to questions. This may be particularly helpful for participants with certain disabilities that impede face-to-face communication. Yet, the lack of visual cues in e-mail can also lead to misunderstandings that may be more difficult to sort out than in face-to-face interaction.

Theorizing Interviews

Research interviewers sometimes express concern that certain ways of asking questions or responding to participants “bias” interview data. For example, this might include researchers asking “leading” questions of participants that assume certain kinds of experiences, or contributing to conversations in ways that provide subjective information about interviewers’ beliefs, experiences, and opinions. The notion of “bias” is premised in positivist assumptions about the production of knowledge about the social world. From this perspective, it is possible and desirable for researchers to take “neutral” stances toward research topics and participants, and the interviewer’s objective is to elicit data that are reflective of “truthful” descriptions of participants’ psychological states and descriptions of “actual” worlds. This view of interview data and the human subject has been seriously questioned over several decades by researchers taking up postpositivist stances toward inquiry.

Researchers taking a constructionist perspective of research interviews view interview interaction as a socially situated encounter in which the interviewer and interviewee co-construct data collaboratively in an “active interview” (Holstein & Gubrium, 1995). From this perspective it is not possible for researchers to lay aside their subjectivities—that is, how personal biographies, social status, and locations such as race or gender interact with the topic of interest and participant—in order to maintain neutral stances. Rather than excavating “truth” about human subjects’ experiences, the active interviewer’s interests are displayed in the formulation of follow-up questions that take some topics as important while overlooking others. Even minimal responses to what participants have said, such as

expressions of surprise (“Oh!”), skepticism (“Really?”), or silences demonstrate interviewers’ interests in research topics.

Steven Talmy (2010) has characterized two main ways in which qualitative interviews have been used in the field of applied linguistics: (a) an “interviewing as research instrument” approach, or (b) an “interviews as social practice” approach. In the former approach, a neopositivist conception (Alvesson, 2003) informs the project, in that the interview strives to ask neutral and unbiased questions to which the interviewee may provide answers that are taken as indicating actual and real interior and exterior states of affairs (Baker, 2004). In the “interviews as social practice” approach, interviews are viewed as accounts that are co-constructed in site-specific and contextually located encounters with particular interviewers and are not necessarily read as indicating “real” states of affairs. Rather, data may be viewed as possible ways of discussing topics, or “talking culture” (Baker, 2000). Talmy (2010) argues that there is a need for researchers in applied linguistics to demonstrate greater awareness of the theoretical assumptions about interviewing and the interview subject underlying research studies, and what these imply for claims made based on interview data.

Steve Mann (2011) argues that researchers in applied linguistics might pay more attention to four “discourse dilemmas.” These include how interview data are co-constructed by speakers, attention to the interviewer’s work, the interactional context of interviews, and consideration in analyses of both “what” is said and “how” accounts are produced by speakers. Mann offers a number of parameters of sensitivity that might be considered by researchers to develop a more critical approach to the use of qualitative interviews.

Transcribing and Analyzing Interview Data

In the broader field of qualitative inquiry, the topical content of interviews has been the focus of transcription practice, and interview excerpts are frequently stripped of the context in which they were produced in representations of findings. Sociolinguists, on the other hand, have developed sophisticated approaches to transcribing linguistic data that attend to the paralinguistic features of talk (e.g., Bucholtz & Du Bois, *n.d.*). Applied linguists, therefore, draw on a range of conventions to transcribe interview data (see Poland, 2002), with choices depending on the theoretical underpinnings of the study. Selecting what features of talk might be transcribed, then, is inextricably linked to the analytic approach that will be employed to describe, interpret, and represent data. For example, both thematic and constant comparative methods of analysis derived from grounded theory approaches focus on the topical content of talk, or words spoken. Inductive approaches to analysis reduce interview data to key concepts and ideas through an iterative process of coding. Codes are then sorted and categorized to develop “themes” or “grounded theory” responding to the research questions. This approach demonstrates an “interviewing as research instrument” perspective (Talmy, 2010), in which data are seen as a “resource” to examine topics of interest. Analytic methods that take an “interviews as social practice” approach (Talmy, 2010)—such as some forms of narrative analysis and conversation analysis—view the co-construction of research interviews as a “topic” of analysis, and may use conventions that provide information about paralinguistic features of talk to examine phenomena such as turn taking, sequential structure, and repair.

The wide array of work represented by *narrative inquiry* approaches to research demonstrates both of these theoretical tendencies. For example, Amy Tsui (2007) conducted a study using narrative inquiry to explore the experiences of an EFL (English as a foreign language) teacher’s formation of professional identity in mainland China. This article uses the participant’s multiple stories to construct a chronological account that focuses on identity formation over time. Other researchers have examined the structure of participants’

storytelling (e.g., Riessman, 2008, for a review of structural approaches to analysis). Interestingly, the model of narrative structure developed by William Labov and Joshua Waletzky (1997) in their study of language variation, while influential in narrative inquiry, has been challenged by researchers who have attempted to replicate the sociological interview method in other settings (Milroy, 1987).

Quality in Interviewing

The “quality” of qualitative interview studies must be assessed in relation to the theoretical assumptions employed in the study, and the discourse community in which a researcher situates his or her work (Hyland, 2000). Thus, researchers must attend to the standards by which the quality of a particular study might be judged within a particular discourse community when designing and conducting a research study (Freeman, deMarrais, Preissle, Roulston, & St. Pierre, 2007; Roulston, 2010), and provide rationales for decisions which push the boundaries of normative research practices. Judgments concerning the merit of a particular study involve assessing the design of a study, how interviews were conducted, representation and interpretation of interview data, and whether researchers have presented sufficient evidence to warrant claims.

Invented Languages in Language Policy and Planning

HUMPHREY TONKIN

The impulse to create languages has a long history, extending back at least to the “Lingua Ignota,” essentially a simplified Latin, devised in the 12th century by the Abbess Hildegard of Bingen (1098–1179). The impulse is related to a strain of linguistic perfectionism traceable through much of human endeavor, particularly in the Western tradition. In Christian contexts it is sometimes related to a desire to rediscover the supposed ur-language, the Adamic, unfallen language, spoken by Adam and Eve in the Garden of Eden. Invented languages are sometimes literary exercises, for example, the language of the Utopians imagined by Thomas More (*Utopia*, 1516), or the nonsense languages in Rabelais’s *Gargantua* (1534) and *Pantagruel* (1532) and Shakespeare’s *All’s Well that Ends Well* (1603). In our day, such imaginary languages include Elvish and the numerous other languages that ornament the fiction of J. R. R. Tolkien (1892–1973), derived particularly from his lifelong interest in Anglo-Saxon and Scandinavian philology. The language of *Star Trek*, Klingon, composed by Marc Okrand, has gained cult status and has its devoted followers and practitioners (Okrent, 2009; on invented languages in general see Blanke, 1985; Duličenko, 1990; Albani & Buonarroti, 1994; Lo Bianco, 2004). A second branch of invented languages consists of so-called a priori or philosophical languages, created from first principles (without reference to existing languages) as taxonomies or classifications of all known phenomena and their interrelationships. The best known of these systems of logic is the language of John Wilkins (1614–72) in his *Essay Toward a Real Character and Philosophical Language* (1668). Wilkins’s language inspired Peter Mark Roget in the compilation of his *Thesaurus* (1852). Other contemporaries of Wilkins who speculated on the possibility of creating a linguistic system that would explain the natural order include René Descartes, Isaac Newton, and Gottfried Leibniz (Knowlson, 1975). Today, such linguistic systems as Loglan and Lojban, and minimal languages like Toki Pona, are inheritors of this tradition.

A third branch consists of a posteriori languages, modeled on existing languages (Blancke, 1985; Schubert, 2002). Though some are intellectual exercises (the creation of “conlangs” has a considerable following on the Internet and elsewhere), others are serious proposals to confront “the language problem”—the assertion that linguistic diversity impedes international communication and is best overcome by an easily learned neutral language advantaging no particular language group. Study of the conditions and requirements for such a language is known as *interlinguistics* (Schubert & Maxwell, 1989). It has implications for numerous branches of linguistics and language pedagogy.

Other strains of invented languages, outside the scope of this entry, include restricted codes for special purposes (such as weather forecasting), interlanguages created for the use of machines, and projects for new writing systems (so-called *pasigraphies*).

Most languages intended for international use borrow elements from a wide range of existing languages, though some are based on a single language, with the intention of simplifying this language and thereby making it more accessible to non-native speakers or users. There are numerous examples of simplifications of Latin (e.g., Latino Sine Flexione of Peano), Slavic languages, German, Romance languages, and English. They range from naturalism (closely following the forms and characteristics of conventional ethnic languages)

to schematism (use of a priori elements and systems along with borrowings from existing languages).

The two best known planned languages are Volapük (1879), created by the polyglot Catholic priest Johann Martin Schleyer (1831–1912), which enjoyed initial popularity but quickly faded, in part because of its inherent difficulty and in part because of internal quarrels; and Esperanto, created over a number of years by a young Jewish oculist, Lazar Ludvik (Markovich) Zamenhof (1859–1917) and published in Warsaw in 1887. Esperanto lies midway on the naturalistic–schematist continuum, consisting of a system of roots drawn from existing languages to which affixes can be added according to an entirely regular system, thereby allowing for the building of a large vocabulary on a relatively minimal set of lexemes (Gledhill, 1998). Less successful but serious attempts at a posteriori languages include Occidental (later known as Interlingue; Edgar de Wahl, 1922); Interglossa (Lancelot Hogben, 1943), based on Greek and Latin but with grammatical elements from non-Indo-European languages; and Interlingua (Alexander Gode, 1951), resulting from the work of the International Auxiliary Language Association (IALA) founded in New York in 1924 by Alice D. Morris. Interlingua, based on Romance languages, enjoyed some brief popularity as a language for scientific abstracts.

Volapük and Esperanto were the only two planned languages to develop a significant language community, and thus perhaps the only two that can be labeled *languages* as opposed to *language projects* (while the imaginary language Klingon has an enthusiastic following, there are few who can claim to speak or use it with any fluency: see Okrent, 2009, pp. 272–81). Esperanto spawned the breakaway project Ido early in the 20th century, but Ido's proponents were always few in number. Esperanto, by contrast, has an active following in the tens or perhaps hundreds of thousands, and those with some knowledge of the language may number a million or more. Esperanto's lexis is based on major European languages, though grammar and syntax display characteristics of many language families. There are speakers and users in most countries of the world, a large literature, an extensive Internet community, and a well-established oral culture. In contrast to Schleyer, whose proprietary control stifled Volapük's development, Zamenhof was acutely sensitive to the need to build a community of speakers; much of Esperanto's durability is due to the fact that the community took ownership of the language quite early on (Blanke, 2009).

The term "planned languages," often used to describe such languages created for practical use, is probably the preferred term today (Blanke, 1987; Schubert, 2002; other terms include "constructed languages," "auxiliary languages," "interlanguages," "international languages," and "universal languages," each with its terminological nuances). In some measure, all languages are planned, since they are controlled and shaped by elites and their institutions (schools, academies, the press, etc.). In corpus planning, there is a continuum, not always recognized by language planning specialists, between largely unplanned languages (ethnic or "natural" languages) at one extreme and fully planned languages at the other. Such languages as Bahasa Indonesia, heavily planned as the language of the newly independent Indonesia, and Modern Hebrew, derived primarily from a single linguistic source but with admixtures from other cognate languages, occupy a midpoint on that continuum. Basic English (C. K. Ogden, 1930), a lexical simplification of English, commanded some attention from English teachers and those interested in the Third World dissemination of English, including Winston Churchill, but was the model for George Orwell's subtractive Newspeak (*Nineteen Eighty-Four*, 1949). Numbers of smaller languages for which modern terminology has had to be created (Icelandic, Irish, etc.) lie close to the unplanned end of the spectrum but employ corpus planning academies and institutes. Planned languages often offer models to corpus planners—for example the Austrian Eugen Wüster (1898–1977), pioneer of the standardization of scientific terminology, the Estonian

Valter Tauli (1907–86), and the pioneer of Bahasa Indonesia, the writer Sudan Takdir Alisjahbana (1908–94), all influenced by Esperanto.

At Columbia University in the 1920s and 1930s psychologist Edward Lee Thorndike (1874–1949) studied the speed at which planned languages could be acquired, as compared to ethnic or “natural” languages, thereby advancing investigation of the relative ease of acquisition of planned languages (mostly Esperanto) that has resulted in several educational experiments, particularly in Britain and Germany (Maxwell, 1988). Evidence suggests that exposing children to Esperanto as a second language helps them understand how languages are structured and gives them confidence to advance to the study of further languages. This “propedeutic” use of Esperanto in acquisition planning continues to attract the attention of educators and schools (e.g., Project Springboard in the United Kingdom). Esperanto’s apparent ease of acquisition has also assisted non-Europeans (e.g., in China and Japan) in acquiring Indo-European languages.

Among planned languages, the most advanced examples of status planning can be found in the Esperanto movement (Janton, 1993; Tonkin, 1997). Zamenhof regarded status planning as well as corpus planning as important to the success of his language. Today, Esperanto users and speakers form a complex and interactive community. A World Esperanto Congress, convened in a different part of the world each year, brings some 2,000 Esperantists together. The Congress features meetings of the various international Esperanto organizations, including the Universal Esperanto Association (UEA), the principal general organization of Esperanto speakers (founded in 1908, with members in over 100 countries and affiliated national organizations in some 60 countries), professional organizations (teachers, scientists, railway workers, lawyers, etc.), religious and special-interest organizations (Catholics, Buddhists, vegetarians, chess players, etc.), and the Esperanto Academy and the Literary Academy of Esperanto. Plays in Esperanto are presented, literary competitions held, and concerts of classical and popular music organized.

Language-cultivation activities go on also at hundreds of smaller meetings, national, regional, and international, taking place during the year. They are supplemented by the publication of books in Esperanto, both fiction and nonfiction, and a flourishing musical culture. The Esperanto Academy monitors language development, but intervenes only minimally, with the result that the language is constantly evolving. Thousands of books have been translated from ethnic languages into Esperanto and the language is sometimes used as a bridge language for translation, particularly between Asia and Europe. The Esperanto holdings of the Austrian National Library in Vienna are perhaps the most extensive in the world, and there are also large collections in libraries in the Netherlands (Rotterdam), Switzerland (La Chaux-de-Fonds), Germany (Aalen), Japan (Tokyo), and Britain (Stoke-on-Trent). Dozens of periodicals appear regularly, along with numerous radio broadcasts, both free-air and Internet. The learning and use of the language is assisted by textbooks and Web sites for acquiring it (the best known Web site is lernu.net), and there are hundreds of dictionaries, both general and specialized; Zamenhof’s initial vocabulary of less than 1,000 word roots has grown to 20,000 or more, from which many thousands of additional words can be formed.

The Esperanto movement has its external language policy. Efforts to promote the language in schools and business go back to the 1900s. In the 1920s, two trends were evident: advocacy of Esperanto in the context of the League of Nations, leading to its adoption as a “clear” language for telegraphy, but not to the broader acceptance by the League that its supporters desired; and its promotion as the language of international socialism in the years following the Russian Revolution. When Stalin succeeded Lenin, he condemned Esperanto as cosmopolitanism, and many Russian Esperantists lost their lives in the Great Purges of the late 1930s or were banished to the Siberian gulags (Lins, 1988). The situation improved after Stalin’s death. Esperantists fought in the Spanish Civil War and Esperanto

was strongly identified with the Catalan independence movement and with left-wing movements in China and Japan. By contrast, Hitler condemned it in *Mein Kampf* as the language of Jews, and the German Esperanto movement was suppressed (Lins, 1988).

After World War II, the Universal Esperanto Association petitioned the United Nations to support Esperanto. The petition, referred to UNESCO (United Nations Educational, Scientific, and Cultural Organization), resulted in a UNESCO resolution in 1954 recognizing Esperanto's contribution to international understanding. Consultative relations with UNESCO and the UN were established, and UEA remains active in both bodies as a non-governmental organization. In the 1970s a proposal by the Australian ambassador Ralph Harry for the staged adoption of Esperanto as the working language of the UN attracted some attention. A UNESCO resolution of 1985 reaffirmed its interest in Esperanto's role in improving international and intercultural understanding.

While Zamenhof and his followers advocated Esperanto primarily as a solution to the lack of a common language, UEA today, though promoting the use of Esperanto in general, stresses the Association's role in favoring language equality and language rights, and opposing the hegemony of major national languages in international affairs, which it views as discriminatory. UEA's Prague Manifesto (1996) characterizes Esperanto as the language of democratic communication. The complex internal language situation in the European Union (Wright, 2009), where all official languages of member states are formally accorded equal recognition, has led to proposals for the adoption of Esperanto as an internal language of communication, but they have so far gained little traction (Phillipson, 2003; Grin, 2005; Christiansen, 2006; Fiedler, 2010). Much as Basic English was advocated in the 1930s, there have also been numerous recent proposals for the use of simplified forms of English and tolerance of non-native English in international discourse (e.g., Ammon, 2003). The Esperanto movement has been active in the study of language policy (LP) and planning, organizing occasional global symposia of LP experts in the so-called Nitobe series, convening meetings of scholars of Esperanto and interlinguistics, facilitating study of language issues at the international level, and exploring the costs of language difference in international affairs.

Johansson, Stig

HANS LINDQUIST

Stig Johansson (1939–2010) was born in Sweden but later became a Norwegian citizen. He studied at Lund and then at Indiana University, where he received a PhD in linguistics in 1968. After working as a lecturer and research fellow in Lund (1968–76) he was professor of Modern English Language at Oslo University between 1976 and 2008. He was Doctor *honoris causa* at Lund University, Sweden (1999), member of the Norwegian Academy of Science and Letters, and honorary member of the Japan Association for English Corpus Studies.

Early Work: The Lancaster–Oslo/Bergen Corpus and the Beginning of ICAME

Johansson's early publications (e.g., Johansson, 1975, 1978) bear witness to a strong interest in contrastive linguistics and second language learning, and these and other areas of applied linguistics, like translation studies, have been important components in his work throughout his career. His intense involvement with corpora started when he spent a year as a Leverhulme Fellow at Lancaster University 1973–74. There Geoffrey Leech and collaborators had begun the collection of what was then the Lancaster Corpus. A close cooperation between Lancaster University, Oslo University, and the Centre for Computing in the Humanities at Bergen University ensued, resulting in the eventual completion of the Lancaster–Oslo/Bergen (LOB) Corpus in 1978 (Johansson, Leech, & Goodluck, 1978). Johansson was later also closely involved in the part-of-speech tagging of this corpus (Johansson, 1986).

At a meeting in Oslo at the beginning of 1977, Johansson together with Geoffrey Leech, Jan Svartvik, W. Nelson Francis, Jostein Hauge, and Arthur O. Sandved formed the International Computer Archive of Modern English (ICAME), which to begin with was to include the Brown Corpus, LOB, and the London–Lund Corpus of spoken British English, the last-mentioned being digitized by Jan Svartvik and his team at Lund. Johansson became the “coordinating secretary” of ICAME and remained so for the next twenty years. In this role, he was central in the development of corpus linguistics. In persuading the Finnish historical corpus linguist Matti Rissanen to succeed him as coordinating secretary, Johansson suggested that ICAME should stand for the International Computer Archive of Modern and Medieval English, and that is now the official interpretation of the acronym.

Johansson's interest in the technical questions of tagging and mark-up led him to participate in the conference which led to the Text Encoding Initiative (Vassar College in 1987) and the development of the TEI guidelines for the representation of texts in electronic form. He was elected chair of the Text Representation Committee and the TEI workgroup for spoken texts.

From Hand-Collecting to Corpus-Based Studies

Johansson (1980) dealt with plural attributive nouns of the type *tapes affair*, *fees scandal*, *drugs problem*, and so forth, specifying the conditions favoring this relatively new and

insufficiently described construction which seemed to be on the rise. The work is based on material collected from newspapers and periodicals but also from other sources including the Brown and LOB corpora and radio and television. In principle, Johansson used the traditional collecting method of predecessors like Jespersen but in addition he carried out supplementary elicitation tests to access users' judgments. The work shows Johansson's strong emphasis on the importance of amassing sufficiently large quantities of authentic material for linguistic investigations. In his conclusion he writes: "Our problem is definitely one which could not have been solved by 'writing-desk' linguistics. . . . The present study was undertaken in the conviction that linguistics progresses through the mutual interaction of the linguist and his material" (Johansson, 1980, p. 119).

Hofland and Johansson (1982) is a pioneering computer-based frequency study, comparing word frequencies in British and American English based on the Brown and LOB corpora. The methodology was further refined and developed in Johansson and Hofland (1989), where the authors provide a statistical description of the LOB Corpus in minute detail, arguing that such detailed description can be useful not only for the linguistic study of grammar and lexis, but also for stylistics and natural language processing. The first volume gives word frequencies and tag frequencies for the corpus, while the second lists all tag combinations and word combinations. The investigation of tag frequencies yields a number of interesting results, showing quite clearly that the different genres in the LOB Corpus are characterized by different proportions of word classes. For instance, informative prose has more nouns, determiners, verbs, prepositions, and adjectives whereas imaginative prose has more verbs, pronouns, and somewhat more adverbs. Although this may not be surprising, the authors are able to give the real, hard figures. As for regional differences, a comparison with the Brown Corpus showed that there were only small differences between British and American English in this respect. A detailed study of the tags of grammatically ambiguous words, that is, words that received two or more tags, provided data of a type that is essential for natural language processing.

Going Multilingual

In 1994, Johansson and a team of researchers in Oslo began a new venture, the creation of an English–Norwegian Parallel Corpus (ENPC), to be used for contrastive analysis and translation studies. The corpus was completed in 1997 and was later tagged (Johansson, Ebeling, & Oksefjell, 1999/2002). The corpus consists of Norwegian source texts matched with their English translations, and English source texts matched with their Norwegian translations, in all approximately 2.6 million words. The genres are fiction and non-fiction. According to the compilers, this makes a range of investigations possible:

- contrastive studies based on parallel original texts;
- contrastive studies based on original texts and their translations, going from source text to translation or from translation to source text, or both; and
- various types of translation studies, for example, focusing on (a) translation problems viewed from either language, (b) deviations of translated texts as compared with original texts in the same language, and (c) general features of translated texts (Johansson et al., 1999/2002).

In Johansson (1998) the distinction between different kinds of parallel corpora is laid out in a lucid manner and a terminology is suggested:

- bilingual/multilingual comparable corpora (original texts in different languages),

- bilingual/multilingual translation corpora (original texts and translations into other languages), and
- monolingual comparable corpora (original and translated texts in the same language (p. 4n).

The ENPC combines all these three types. However, Johansson brings up a number of problems with translation corpora that researchers should be aware of. First, not all types of texts get translated, so the corpus will not be representative of the total body of texts in a language. Second, the translations may be more or less strongly influenced by the idiosyncrasies of the individual translators. Finally, translated text may be influenced by interference from the source text, and there may be general traits typical of all translations that distinguish them from original texts in the same language. These effects need to be controlled for. The ENPC was developed in close collaboration with Swedish colleagues in Lund and Gothenburg who compiled the English–Swedish Parallel Corpus (ESPC), which has the same structure and to a great extent the same English original texts.

The ENPC was later extended to include German, Dutch, and Portuguese, thus laying the foundation for the Oslo Multilingual Corpus which includes a trilingual English–Norwegian–German corpus, French–Norwegian and German–Norwegian parallel corpora and a translation corpus of Norwegian originals translated into English, German, and French. These corpora were developed within the research network *Språk i Kontrast* (SPRIK) with Johansson as codirector.

In a separate extension of the Oslo Multilingual Corpus, eight distinguished professional translators were asked to make Norwegian translations of two texts, a short story and a scientific article. In this way, eight parallel translations of these two texts were obtained and could be used for investigations of variation in translation.

However, compiling the texts is only the beginning. In order to be able to search them efficiently, they must first be aligned, that is, each sentence or unit in the originals must be related to its translation. This is not a trivial task since the division into sentences is rarely identical in originals and translations. Ideally, the texts should also be tagged for part of speech. In his 1998 article, Johansson illustrates with three case studies how the corpus can be used. The first is a case where there is no obvious translation equivalent in the target language: the Norwegian modal particle *nok* gets a number of different translations, among which the adverb *probably* is the most frequent. However, looking at translation in the opposite direction, it turns out that *probably* is rarely translated into *nok*, which shows that translators sometimes miss the most natural translation and produce translations which deviate from original texts in the target language. Another finding was that in many cases *nok* was not translated at all: there was zero translation.

In the second case study the Norwegian translations of the notoriously difficult noun *mind* were analyzed. Johansson found a large number of different Norwegian nouns used in the translations, but also many kinds of circumlocutions with no particular noun corresponding to *mind*. This was especially the case when *mind* was part of a fixed phrase in English. In the third case study Johansson shows how correspondences, which on the surface look straightforward like that between Norwegian *hende* ‘happen’ and English *happen*, turn out to result in a number of different patterns in the translation. In conclusion, Johansson argues convincingly that computer corpora “may even transform our ideas of what a linguistic description should be like. With the availability of corpora in machine-readable form, we can imagine a new generation of linguistic descriptions, which combine dictionary, grammar, and corpus” (Johansson, 1998, p. 21). This, he claims, has both theoretical and practical implications.

In a later collection of case studies based on multilingual corpora, Johansson points out that through the compilation and use of translation corpora, contrastive linguistic studies

have developed from comparing the structures of the languages involved in the abstract to studying these structures in use (Johansson, 2007, p. 6). He calls for the creation of more multilingual corpora, covering more languages, more registers and spoken language, but stresses that these should be organized in a principled way and encoded to some accepted standard like that proposed by the Text Coding Initiative (pp. 304–5).

Grammar Writing

Johansson was involved in a number of grammar writing projects. Together with Per Lysvåg he wrote the contrastive *Understanding English Grammar* (1984) for the Norwegian market, followed by *English Grammar—Theory and Use* (1998), written with Per Lysvåg and Hilde Hasselgård. He also contributed to the *Longman Grammar of Spoken and Written English* (Biber, Johansson, Leech, Conrad, & Finegan, 1999), where he was the principal author of four chapters amounting to approximately one third of the text.

Conclusion

Johansson made important contributions to corpus linguistics and the application of corpus linguistics to real-world problems in a number of ways: as a diligent compiler and developer of corpora, as an innovative and pioneering corpus user, as author of important scholarly articles and books, as editor of collections of articles and journals, as a grammar writer, as initiator of international organizations, as organizer of conferences and symposia, and as supervisor and advisor to many doctoral students and colleagues. From the beginning of the 1970s he was at the center of the development of corpus linguistics, ever active in developing new methodologies, compiling corpora and exploring new avenues of research, often together with colleagues. However, he had always been mindful that corpus work needed to be complemented with other types of research. In Johansson (1991) he writes:

A word of warning should be added in conclusion. Corpus work is not the be-all and end-all of linguistics. The ultimate aim is the study of language(s), through corpora and other means. Linguists who neglect corpora do so at their peril, but so do those who limit themselves to corpora. In practice, there will often be a division of work, with some linguists focusing on theory building and others on corpus work. This is not a problem as long as we realize the limits of our approach and respect other lines of investigation. An open mind is the best guide in linguistics, as in research in general and indeed in life itself. (p. 6)

Johns, Ann

SUNNY HYON

Known internationally for her expertise in English for specific purposes (ESP), genre studies, and second language (L2) writing, Ann Johns has been influential in various applied linguistics contexts. Johns began her teaching career as a history and English teacher in an Illinois middle school. She later moved to California, completed her PhD at the University of Southern California, and was a professor in the Departments of Rhetoric & Writing Studies and Linguistics & Asian/Middle Eastern Languages at San Diego State University (SDSU). At SDSU, she was also the founding director of the American Language Institute and director of the Center for Teaching and Learning. Although retired from SDSU since 2002, Johns has remained highly active in scholarship and teacher development, focusing particularly on academic literacy issues for undergraduate and secondary school students. She was co editor for the journal *English for Specific Purposes* and has served on the editorial boards of *Journal of Second Language Writing*, *TESOL Quarterly*, *Journal of English for Academic Purposes*, *ESpecialist*, and *English for Specific Purposes*. Johns's research spans several areas, including academic discourse, ESP needs assessment, and genre theory and pedagogy for reading and writing curricula.

Academic Discourse

In the area of academic discourse, Johns has studied features of specific disciplinary texts and of academic writing more generally. In a study of one undergraduate student's "visual/textual interactivity," Johns (1998) demonstrates that visual display of data and argumentation around that display are central values in economics. Another investigation draws on the expertise of two successful engineering grants writers (both non-native English speakers) to examine rhetorical features that appeal to their grant-reviewing audiences (Johns, 1993). These features include connecting to the reviewers' research interests, establishing a research gap, making an appropriate claim, and incorporating mathematical formulas and visual illustrations. Interestingly, the writers' winning proposals contain multiple L2 grammatical errors, leading Johns to suggest that "among some audiences, then, a 'foreign accent' in writing is accepted or ignored" (1993, p. 84). In terms of general characteristics of academic writing, Johns (1997) synthesizes work by Peter Elbow, Clifford Geertz, and Alan Purves, observing that academic prose tends to embody—among other features—explicitness and clarity, early introduction of argument, metadiscoursal "sign posts," authorial distance and objectivity, and a guarded, hedged stance.

ESP Needs Analysis

As an ESP expert, Johns has an orientation to needs analysis, using various approaches to assess needs in academic contexts. In early work, she surveyed university faculty about the most important skills for undergraduate and graduate students, finding that reading and listening outranked the productive competencies of writing and speaking (Johns, 1981). Taking a more text analytic approach, Johns and Paz (1997) identified problematic

gaps in students' abilities to summarize scientific texts. By comparing teacher and student summaries, the authors found that while teachers appropriately followed the text's own schema for describing a physical structure, students' summaries lacked such framing and included nonessential information. Recently, Johns and Makalela (in press) discuss a critical ethnography approach to needs analysis, in which ESP consultants reflect on their own "frames, intentions, and purposes" that might either serve or be destructive in the target context.

Johns has also attended to students' own perspectives on their language and literacy needs. She interviewed a Vietnamese American undergraduate "Luc" to investigate why he—like many other non-native English speakers—failed English department writing proficiency exams (1991). From their conversations, Johns found that this high-achieving major succeeded on his science writing exams because of his familiarity with the writing prompt organization, the class concepts and vocabulary, and the concerns of his audiences. Luc's expertise in these areas, however, was irrelevant on the university's writing competency exam, which he had failed multiple times and which required background knowledge outside his areas of study. Johns's findings raise important questions about institutional assessments of students' literacy needs and abilities.

While concerned with identifying needs relevant to students' situations, Johns (1988a) cautions against using needs analyses to create static representations of target contexts. Disciplinary "truths" and knowledge-making practices change via both large-scale paradigm shifts and individual instructor idiosyncrasies. Johns thus argues that "we must look at the academic milieu as a fluid target culture, one that should be continuously analyzed and exploited for the purposes of ESP" (1988a, p. 25). One way for ESP courses to embrace this fluidity is for students to become "ethnographers in the academic culture" (1988b, p. 57). As such, they learn to critically examine the knowledge claims, writing tasks, and instructor and student roles in their specific courses, and in so doing develop the "rhetorical flexibility" to navigate whatever context they encounter (Johns, 1997, 2008, 2009b).

Genre and Academic Literacy Development

Students are foregrounded as literacy investigators in Johns's *socioliterate approach* to academic development, a framework that also emphasizes *genre*, which Johns calls "the most social constructivist of literacy concepts" (2009b, p. 205). Johns (1997) explains that in a socioliterate classroom, students study various genres—both "homely" ones like wedding invitations and obituaries, and academic ones like textbooks and classroom writing tasks—in order to understand how all texts are constructed in context and dependent upon reader and writer roles. While such an approach combines elements of traditional form-oriented instruction and learner-centered pedagogies, it is centrally social constructivist in viewing all textual forms and individual processes as situationally shaped.

Johns (1997) details various in-class and at-home activities for implementing a socioliterate approach, including moves analyses of timed essay prompts, identification of discipline-specific vocabulary, interviews with faculty about their textbook selections and recommended reading strategies, and participant observation of class lectures. She also illustrates how these and other socioliterate tasks work in her own classrooms. In writing classes with Generation 1.5 students (i.e., US-resident L2 students with both native- and non-native English speaker characteristics), for example, Johns asks students to collect and analyze genres from their own communities, such as flyers, church programs, invitations to raves, and articles in *Low Rider* magazine. In this way, students develop sensitivity to genre and genre variation, which they can also apply to academic genres (Johns, 1999, 2009b). Students in her classes write texts in various genres as well, including classroom genres like research papers and genres of disciplinary experts like abstracts (Johns, 1995). In one class, students'

favorite assignment was writing a memo to the university president, which required them to research the president's values and interests and consider how these and other factors should shape their memos (Johns, 1999). In other courses, Johns has asked students to defy traditional templates (e.g., by postponing the thesis until the conclusion) in order to "destabilize their often simplistic and sterile theories of texts" (Johns, 2002, p. 240).

Johns has implemented these various socioliterate activities in "linked" reading/writing classes that first-year SDSU students take while simultaneously enrolled in a General Education course such as Western civilization, psychology, or geography. The linked arrangement provides an ideal context for students to investigate academic community practices and to learn to analyze new genres. For Johns, this constitutes a real *genre awareness education* that "will prepare students for the academic challenges that lie ahead" (2008, p. 239). Such an education is in contrast to mere *genre acquisition training*, which teaches students to reproduce a specific text type but not to deconstruct future genres (see Russell & Fisher, 2009, for the genre awareness vs. genre acquisition distinction that Johns adapts). Johns argues that a genre awareness focus is also more intellectually engaging for Generation 1.5 students, who are often placed in "remedial" English courses that ask them "to produce the same types of texts over and over again," such as the five-paragraph essay (2009b, p. 203).

Indeed, Johns's focus on first-year literacy courses has made an important contribution to genre studies, where relatively little attention is given to pedagogical applications for undergraduates, especially those from linguistically diverse backgrounds. Developing genre-based pedagogy for these novice student populations is a complex undertaking, says Johns (2008), for applications must both address the complexity of genres and be accessible. She acknowledges that she is in an "ongoing search" (p. 237) for genre-based literacy curricula, for which there is no one definitive method but rather various possibilities and approaches. Exploring one such possibility, Johns (2009c) advocates giving students experiences with a variety of written "response types" (Carter, 2007) that recur across undergraduate courses: problem-solving/system-generating responses, empirical inquiries, responses calling for research from sources, and responses calling for performance. Through engaging in and reflecting on such assignments, as well as interviewing faculty about them, undergraduates can learn to negotiate a variety of literacy situations. Johns's focus on undergraduate EAP (English for academic purposes) curricula occupies an important nexus between L1 and L2 composition studies and between different strands of genre theory. Both L1 and L2 compositionists are concerned with genre but, while L1 scholars tend to emphasize the contextual factors shaping genre, L2 genre researchers attend more to genre structures and lexicogrammatical features. By integrating formal and situational concerns, Johns's socioliterate approach melds these two worlds. Her work also draws from various schools of genre, as seen in her 2002 edited volume *Genre in the Classroom*, which includes scholars from three central genre paradigms: the Sydney School, English for Specific Purposes, and the New Rhetoric.

Teaching and Curriculum Development

Johns has fostered cross-disciplinary collaboration in teaching and curriculum development as well. At SDSU, she worked with ESP and L1 rhetoric specialists in founding the Department of Rhetoric and Writing Studies. She also began SDSU's Integrated Curriculum, a program in which first-year undergraduates take literacy courses linked with a General Education course. The program is the first of its kind in the California State University system and has increased student retention and created curricular partnerships between faculty.

Outside of her university, Johns has also been highly active in teaching projects with local secondary schools. As a result of her high school collaborations, she developed a manual for student research to help instructors design and evaluate research assignments. In addition, she wrote a three-semester college-readiness literacy curriculum for the Advancement Via Individual Determination (AVID) program. The materials outline activities related to writing prompt analysis, purpose-driven reading, focused note taking, and source integration (Johns, 2009a). Through these and other projects, Johns has put her socioliterate approach into motion, helping at-risk students flourish in academic contexts.

On the international level as well, Johns is a well-known and well-traveled educator and materials developer. As John Swales observes, she has been the “U.S. supreme ambassador at large for ESP” (Johns & Swales, 1998, p. 22), giving presentations and workshops in more than 20 countries, including Algeria, Egypt, France, Hungary, Italy, Jordan, Lebanon, Mexico, Pakistan, Singapore, and Tunisia. Daoud (1998), a former Johns student and now a Tunisian ESP expert, notes that Johns is highly effective “in the way she tunes in to her audience, whether using a local text to illustrate a particular genre, answering questions with quick insight into the interlocutors’ hidden agenda, or proposing practical solutions appropriate to the local teaching/learning context” (p. 92). Her ability to connect with these diverse teaching situations has borne fruit in instructional materials: she created a reading/writing curriculum for freshmen at the University of Limpopo, South Africa, and contributed to a cross-curricular literacy program at Sabanci University in Turkey (2009a). In addition, she assisted Antonine University in Lebanon to develop ESP courses for a variety of majors.

Ann Johns has said that she wanted to be a cabaret singer but instead found that “teaching provides some of the same opportunities. And in the end, it is much more gratifying” (2009a). Although the world of cabaret may have lost a great talent, we in applied linguistics surely gained a perceptive scholar, a gifted teacher, a lucid writer, and a tremendous advocate for students.

Johnson, Samuel and Lexicography

PATRICK HANKS

Samuel Johnson (1709–84) was not the first but was surely the greatest of all English lexicographers. Unlike most writers of dictionaries, he was not only a lexicographer but also a leading man of letters. His output was enormous: literary criticism, biographies, weekly journalism, poetry, an edition of Shakespeare, a grammar, and a novel poured out of him. He was also a great conversationalist—a “clubbable” man, to use his word. He evidently had an obsessive-compulsive personality (a considerable advantage for a lexicographer, who has to have enough stamina and compulsion to wade through thousands of words, day in, day out, year in, year out, providing detailed and consistent accounts of the meaning and use of each one). People who met him remarked on his strange compulsive and uncontrollable nervous jerks and tics; modern neurologists have diagnosed him as probably suffering from Tourette’s syndrome. Despite his prodigious output, Johnson not infrequently castigated himself for idleness.

As a young man, he attended Oxford University for a year, but his family ran out of money and he left without a degree. He claimed to have received the following advice from his tutor: “Read over your compositions, and wherever you meet with a passage which you think is particularly fine, strike it out.” Twenty-six years later, some of his friends and admirers in Oxford, notably Thomas Warton and Francis Wise, persuaded the university to grant him an honorary degree, just in time for him to be able to append the letters “A.M.” (*Artium Magister*, “Master of Arts”) after his name on the title page of his dictionary.

In the 1740s Johnson was already recognized as an important figure on the London literary scene, though hardly as the preeminent figure that he later became. Nevertheless, his reputation for literary skill, sound judgment, energy, and reliability was high enough to persuade a consortium of booksellers to club together in 1746 and put up the money to commission him to write, single-handed (except for a few clerks to copy out quotations), a dictionary that would serve to “fix” the language in what was then believed to be its current state of perfection, throw out slang, cant, and other “low words,” and serve as a guard against linguistic change.

In the early 18th century there had been a great deal of lexicographical activity in England, notably Nathan Bailey’s very popular *Universal Etymological English Dictionary* of 1721, the first work to attempt to record *all* the words of English (as opposed to listing and explaining only so-called “hard words”). Moreover, there had already been several calls for a prescriptive dictionary on the model of the Italian dictionary of the *Accademia della Crusca* and the French dictionary of the *Académie Française*. In the 18th century, as in every other era before and since, literati believed, however irrationally, that linguistic change is bad and that the language was “going to the dogs.” Influential men such as Lord Chesterfield as well as the commissioning booksellers convinced themselves that Johnson was the man for the task of fixing the language and preserving its purity. Shortly after starting work, Johnson published his *Plan of an English Dictionary* in the form of a letter addressed to Chesterfield, by way of soliciting the latter’s patronage (which perhaps had already been offered informally). In it he made it clear that he intended to take on, albeit with some misgivings, the role of arbiter of correct English that was being thrust upon him. The *Plan*

also shows that in 1747 he shared the widespread belief that etymology is a good guide to the correct meaning and use of words. And he set out some principles for the ordering of definitions:

It seems necessary to sort the several senses of each word, and to exhibit first its natural and primitive signification; as, To *arrive*, to reach the shore in a voyage: *he arrived at a safe harbour*. Then to give its consequential meaning, to *arrive*, to reach any place, whether by land or sea; as, *he arrived at his country-seat*. Then its metaphorical sense, to obtain any thing desired; as, *he arrived at a peerage*. Then to mention any observation that arises from the comparison of one meaning with another; as, it may be remarked of the word *arrive*, that, in consequence of its original and etymological sense, it cannot be properly applied but to words signifying something desirable; thus we say, *a man arrived at happiness*; but cannot say, without a mixture of irony, *he arrived at misery*.

However, by the time he arrived at publication in 1755, Johnson's view of the function of a dictionary and the nature of language had changed. The true significance of Johnson as a lexicographer is that, in the course of compiling his dictionary, he came to understand that a living language has its own dynamic and that it can never be "fixed" or "purified." He developed the principle that a dictionary maker must record the language as he or she finds it, not attempt to regulate it. By doing so, he spared the English language the impertinence of an academy of learned men impotently debating the acceptability or otherwise of behavioral phenomena (patterns of word meaning and word use) which they have no power to alter. Reddick (1996) also argues that Johnson's brilliance as a literary critic was sharpened by his work on the dictionary.

Johnson, then, is remarkable for his profound insight into the nature of a living language. This insight had cost him dear. When he started out in 1746, Johnson assured his backers that he would complete the work within four years. He set up a framework on sheets of paper, following the principles outlined in the *Plan*. Under each headword, an amount of space was left on the page that he estimated would be sufficient to accommodate the text. Evidently he judged the amount of space needed for each entry by comparing existing dictionaries. Citations were copied by his amanuenses (from books that he had marked up) into the spaces left; Johnson himself then wrote the definitions and etymologies. But after three years it was becoming clear that this system was not working. As more and more citations were collected, Johnson discovered more and more new senses that needed to be added, while according to Reddick (1996) he felt an increasing need to reorganize the entries and "shape" the supporting citations by judiciously cutting out irrelevant parts of the text. By the end of 1749, Johnson was in deep trouble. He had reached only as far as letter C, the money originally agreed had almost all been used up, and the papers on which he had so confidently set out his framework were becoming so cluttered with insertions and alterations that they were unacceptable to the printer. A lesser man would have admitted defeat and given up. Johnson had the magnificent humility to recognize the problem and start over. The work that had already been done was rewritten, incorporating Johnson's new insights into words and their meanings. Needless to say, his financial backers were not happy at this huge setback. They were even less happy when they discovered that instead of devoting himself single-mindedly to the dictionary, Johnson had committed himself, in order to keep body and soul together, to writing two issues a week of a journal, *The Rambler*, which he continued to do in parallel with working on the dictionary for three years.

It has sometimes been claimed that Johnson relied heavily on the definitions in previous dictionaries. The myth even got about that there is in existence an interleaved copy of Bailey's dictionary with Johnson's additions slipped in. This is not the case. On the contrary,

a scholarly study by Starnes and Noyes (1991) showed that Johnson's definitions were often highly original, capturing the essence of the word's meaning more accurately and succinctly than any previous dictionary. Other important studies are by Sledd and Kolb (1955), Clifford (1979), and Reddick (1996).

In discussions of Johnson as a lexicographer, much has been made of the occasional flashes of wit in his definitions. Here is a famous example:

Patron. . . . One who countenances, supports or protects. Commonly a wretch who supports with insolence, and is paid with flattery.

This particular definition was a jibe at Lord Chesterfield, who had done nothing to support Johnson during his nine long years of impoverished struggle and then presented himself to the public as a patron of the work when it was published, without evincing the slightest understanding of Johnson's insight into the unstable nature of a living language. Johnson wrote a famous letter to Chesterfield, asking him, with unconcealed sarcasm, "Is not a patron, my lord, one who looks with unconcern on a man struggling for life in the water, and when he has reached ground, encumbers him with help?" To his credit, Chesterfield admired the letter greatly and showed it to his friends and visitors. Some years later, the two men were reconciled.

Another example of a Johnsonian sally is:

Pension. . . . An allowance made to any one without an equivalent. In England it is generally understood to mean pay given to a state hireling for treason to his country.

This witticism was to rebound on him several years later, when he was awarded a pension of £300 a year in recognition of his services to lexicography and the English language.

Occasionally his delight in using obscure or ponderous words got the better of him:

Cough. . . . A convulsion of the lungs, vellicated by some sharp serosity.

Network. . . . Any thing reticulated or decussated, at equal distances, with interstices between the intersections.

No doubt Johnson indulged himself in such wording at least in part to keep his spirits up, because, as he wrote (illustrating the adjective *dull*), "making dictionaries is dull work." However, we must not allow delight in famously verbose definitions such as these to obscure the fact that the vast majority of Johnson's definitions are brief, brisk, and workmanlike. A few examples will have to suffice:

Coruscation. . . . Flash; quick vibration of light.

Sacerdotal. . . . Priestly; belonging to the priesthood.

Surreptitious. . . . Done by stealth; gotten or produced fraudulently.

Johnson is often credited with being the first lexicographer to support his definitions systematically with citations from literature, and this is true as far as English is concerned. However, in fact the principle that a dictionary should record citations as well as definitions had already been established in the Latin dictionaries of Ambrogio Calepino (1502) and Robert Estienne (1531) and was also followed by the prescriptive dictionaries of the French and Italian Academies. Johnson's purpose in citing from literature was rather more ambitious: not merely to illustrate the correct usage of words but also to instruct and delight the reader. As Reddick (1996) shows, he chose some examples because he approved of the writer's sentiments and rejected others because he did not. His aim was to select

citations from “authorities”—writers who both expressed admirable sentiments and were masters of elegance and style. Nevertheless, as he ruefully admitted in the Preface, “words must be sought where they are to be found,” so many less-than-elegant citations are given. His coverage of the terminology and scientific terms of his day was extensive, often supported by long citations from specialist writers. Hanks (2005) argues that Johnson was 200 years ahead of his times because he insightfully addressed many of the theoretical issues involved in lexicography and language teaching, including the problems of foreign borrowings, phrasal verbs, compound nouns, and *-ing* forms; the difficulties of definition writing; and the competing needs of foreign learners and native speakers as dictionary users. (This article appears in McDermott & Moon, 2005, which contains six other important papers on Johnson as a lexicographer.)

Johnson’s work remained the standard dictionary of English until the end of the 19th century, when it was superseded by the Philological Society’s *New English Dictionary on Historical Principles*, later rechristened *The Oxford English Dictionary* (OED; 1884–1928).

Jones, Daniel

BEVERLEY COLLINS AND INGER M. MEES

Daniel Jones (1881–1967), the greatest British phonetician of the 20th century, was born in central London on September 12, 1881. Excelling in phonetic observation and description, and the application of phonetic science to the problems of the real world, Jones always regarded himself as being first and foremost an applied linguist.

Jones was educated at two private schools, Radley College and University College School, and at Cambridge University, where in 1903 he obtained a bachelor's degree in mathematics (converted to MA in 1907). Whilst still a student, he developed his remarkable practical language talents, attending vacation courses in France and at Marburg in Germany, where in 1900 he was introduced to phonetics by a famous language teacher of the day, the Australian William Tilly (Collins & Mees, 1999, pp. 12–17), whom he ever afterwards held in high regard.

After graduation, Jones was forced to study law by his father (a leading London barrister), but was permitted to spend a year in France, where he befriended the eminent French phonetician Paul Passy of the University of Paris. Passy, a second major influence, recognized Jones's unusual talents and encouraged him to sit the examination of the International Phonetic Association (IPA). Jones passed his IPA certificate with brilliant marks, but it turned out to be the only linguistic qualification he ever obtained (although he was later awarded honorary doctorates from Zurich, 1936, and Edinburgh, 1958). He also received private tuition from the great linguist Henry Sweet, who was to prove the third main influence on Jones's life and work.

Jones passed his law examinations in 1907 but never practiced as a barrister (he later claimed to have set fire to all his law books). Instead, he accepted a temporary part-time position in phonetics at University College London. The subject was in its infancy as an academic discipline, but soon gained popularity under Jones's inspired teaching. In 1912, Jones established a phonetics laboratory at UCL, where in the same year he was appointed head of the new phonetics department—the first such to exist in a British university. After briefly replacing Henry Sweet at Oxford, Jones returned to London and in 1921 was awarded a chair at UCL; he remained there until retirement in 1949, when he became professor emeritus.

From the outset of his career, Jones concentrated on applied phonetics. His publications bear witness to this, since most are concerned with the utility of phonetics for either language description, language acquisition, or phonetic lexicography. His most successful early book was *The Pronunciation of English* (1909), a brief description of standard educated British English pronunciation. The far more comprehensive *Outline of English Phonetics*, aimed at non-natives, appeared in 1918 and was the first full account of what Jones was later to term “received pronunciation” (RP). Its general descriptive framework was adopted throughout the linguistics world, and deeply influenced Bloomfield and the American structuralist school.

In 1912, Bernard Shaw produced *Pygmalion*, a play which Shaw used explicitly to inform the general public about the importance of phonetics. He is known to have received advice from Daniel Jones on practical matters, and it is now thought that it was Jones (rather than Henry Sweet) who was the real-life original of the play's main character, the phonetician

Figure 1 The earliest published form of the cardinal vowel diagram (Jones, 1917a, p. ii). Note that in the original the English vowels are printed in red. Reprinted with permission of Mrs. M. Stanbury © Estate of M. Stanbury

Henry Higgins. To divert any suspicion that Higgins was in fact based on Jones, and thus avoid any threat of libel, Shaw muddled the waters by inserting into the Preface of the published version of the play (1916) numerous references to the recently deceased Sweet and to the Poet Laureate Robert Bridges—while carefully omitting mention of Jones himself (Collins & Mees, 1999, pp. 97–103).

In 1913, Jones coedited (with Hermann Michaelis) the *Phonetic Dictionary of the English Language*. This was the first attempt at a dedicated pronunciation dictionary for English in more than a century—apart from one brave earlier effort by the Swede Jon Arvid Afzelius (1909). Both books were soon swept away by the success of Jones's own *English Pronouncing Dictionary* (1917a), which speedily became the accepted authority on British RP usage; it remains in print (in updated form) to the present day.

An article in *Nature* (1917c) allowed Jones a first exposition of his influential cardinal vowel theory. Originating in part from Passy, it provided a clear-cut dual-parameter model for vowel description based on (a) tongue-arch height and (b) lip shape. Jones subsequently elaborated the theory, devising a system of eight rounded and eight unrounded vowels at supposedly equidistant articulatory intervals, plus two high central vowels (Collins & Mees, 1995). He made three recordings of the cardinal vowels in 1917d, 1943, and 1956, of which the last is best known. The cardinal vowel system—despite being in some dispute today owing to contradictory instrumental evidence—has been extensively employed since its inception, and much present-day vowel description derives ultimately from Jones’s model. It is of note that a diagram largely based on Jones’s scheme is a prominent feature of the current 2005 IPA chart (see Figure 1).

In his research, Jones is notable for the precision of his phonetic observation, always insisting on working directly with native-speaker informants rather than relying on the accounts of other linguists. He pioneered the description of non-European languages, producing groundbreaking early outlines of Cantonese (Jones & Woo, 1912), Tswana (Jones & Plaatje, 1916), and Sinhalese (Perera & Jones, 1919), and today the value of this extremely accurate early research on tone languages is receiving due recognition. His subsequent descriptions of Tswana, much in advance of their time, provided the first detailed overviews of a register tone language, including diagrammatic representations of the concept of downstep (Jones & Plaatje, 1916, pp. xxv–xxxi; Jones, 1917b, 1928). Jones’s seminal work on African languages was later expanded by his London colleagues, including Lilius Armstrong, J. C. Carnochan, C. Doke, Eugénie Henderson, A. N. Tucker, and Ida Ward.

In the field of European languages, his *Pronunciation of Russian* (Trofimov & Jones, 1923) was for many years the sole reliable phonetic description of the language available in English. At the very end of his life, Jones rewrote this book (with Dennis Ward), and it came out posthumously with the new title *Phonetics of Russian* (Jones & Ward, 1969). A landmark publication appeared in 1927, namely *Colloquial French*, coauthored with Emile Stéphan. It included a startling novelty—numerous phonograph discs with 90 minutes of native-speaker French for imitation. It is arguably the most successful early example of the use of the audiolingual method in language teaching in the history of applied linguistics.

As early as 1917, Jones publicly used and promulgated the term “phoneme” in its current sense, being the first writer in the Western world to do so. He acknowledged borrowing the idea from Baudouin de Courtenay, choosing to interpret the concept simply as a “family of sounds” having close physical or acoustic relationship. As a result of Jones’s work, the phoneme principle became firmly established in British linguistics well before the advent of either the Prague school or American structuralism; see Jones’s own (1957) historiographical survey. A nervous breakdown in 1920 somewhat diminished the dynamism of Jones’s production of full-length books, but he went on producing numerous articles and making important revisions to his major publications (see Collins & Mees, 2003). He devoted much effort to what he hoped would be his monumental work, *The Phoneme* (1950), but its reception was a disappointment. Although the reliability of the language data it contained was acknowledged, what was felt to be Jones’s outdated theoretical position and undue emphasis on applied linguistics approaches drew harsh criticism from many postwar linguists, who were by now accustomed to more sophisticated analyses.

Jones was also a major player in many other areas of applied phonetics. In cooperation with Passy, he ran the IPA (assistant secretary 1906–27; secretary 1927–50; president 1950–67) and was editor of *Le Maître Phonétique*. He was largely responsible for the increasing acceptance of the IPA alphabet worldwide, and was a constant supporter of English spelling reform. He also helped devise, with varying degrees of success, new Roman alphabets for many African and Asian languages. He was a member of the BBC Advisory Committee on Pronunciation, and from 1942 onward was the BBC’s chief pronunciation adviser, being to a large extent responsible for reinforcing the notion of “BBC English” as a standard for broadcasting. In 1926, in the third edition of the *English Pronouncing Dictionary*, he revived the 19th-century term “received pronunciation” and introduced the abbreviation “RP” (p. viii). He regarded a model such as RP as being essential for non-native learners, but simultaneously deprecated attempts to prescribe any form of standard speech for natives. He was a committed libertarian with regard to standards of pronunciation, and repeated constantly that the task of the phonetician was not to pass value judgments but to “record accurately” and be a “kind of living phonograph” (1917a, p. ix). In this spirit, he proved a perceptive observer of language change, and was, for example, the first to mark the development of glottalization in British English, and the increasing influence of basilectal London speech on RP (Collins & Mees, 2001), thus presaging the development of what is nowadays termed “Estuary English.”

With the passing of time, Jones's writings, especially in the field of applied phonetics, have achieved the status of classic works, remaining outstanding for their phonetic detail, perceptive observation, and clarity. His ideas and methodology always demonstrated an overwhelmingly practical bias, indeed certain of his publications—such as the pamphlet “The Aims of Phonetics” (Jones, 1937)—drew criticism from some quarters for their utilitarian bias. Nevertheless, many basic aspects of Jones's practical approach to the subject were adopted by his younger colleagues and pupils, notably A. C. Gimson, J. D. O'Connor, Peter Ladefoged, and J. C. Wells, and continue to influence applied phonetics to the present day, in particular the fields of language acquisition and pronunciation teaching.

Despite being crippled with arthritis, Jones continued to be active in linguistics until well over the age of 80. He died at his home in Gerrards Cross, England, on December 4, 1967.

Jones, Rodney H.

JACKIE JIA LOU

Rodney H. Jones (b.1959) is currently the Associate Head of the Department of English, City University of Hong Kong, where he has been teaching since 1995 (home page: <http://personal.cityu.edu.hk/~enrodne>). Jones received a BA in English Literature from the University of Virginia in Charlottesville, an MFA in Creative Writing from the University of Kansas in Fayetteville, an MPhil in English from City University of Hong Kong, and a PhD in Linguistics from Macquarie University, Sydney. His research interests include youth cultures, computer-mediated communication (CMC), multimodal discourse analysis, mediated discourse analysis, discourse and sexuality, and health communication.

Jones's main contribution to applied linguistics lies in his ethnographic study of the production and consumption of multimodal discourse. In the spirit of mediated discourse analysis (Scollon, 2001; Scollon & Scollon, 2004; Norris & Jones, 2005), he does not assume a priori the central role of multimodal texts in social interactions. Rather, taking a participatory ethnographic approach, he sees these texts as embedded in the complex interactions among semiotic and material environment, social interactions, relationships, and identities. In particular, his work focuses on the actions involved in the production and consumption of these texts. This view of Jones's is grounded in his empirical research in three main areas: computer-mediated communication and youth literacy, computer-mediated communication and homosexuality, and skateboarding.

In his earlier work on computer-mediated communication, Jones uses the term "site of attention" to describe CMC as an activity in which users rapidly switch among multiple online and offline interactions (Jones, 2005a, 2009d). Using participatory ethnographic methods such as diaries, screen movies, and Webcams, Jones is able to expand the context of CMC beyond the screen to participants' homes or classrooms and is able to observe other parallel social interactions in which participants engage, for example, watching TV, answering a phone call, or talking to parents (Jones 2001, 2002, 2004, 2009d). Instead of regarding this practice as simply multitasking, Jones (2005a, 2010) argues that it shapes a kind of attention structure, as a result of the participants' habitual interactions with the semiotic, material, social, and cognitive spaces. This site of attention, however, is disrupted when the computer is transplanted from a media-rich environment to a computer-mediated classroom with rigid spatial and social order. Therefore, he argues that the inability to pay attention in a classroom is not the fault of the student or the computer, rather the consequence of a conflict between the usual site of attention and a new set of spaces.

Adopting a more microanalytical approach to multimodal discourse, Jones has also studied online interactions between gay men. By taking into account the actions these participants take before, after, or during these interactions, Jones's focus is not on the meaning of multimodal texts but on their functions. For example, at the initial stage of online encounter between gay men, the exchange of photos is an important social action, which determines whether it will turn into a longer-lasting interaction or relationship (Jones, 2005b). In another article, on televideo cybersex, Jones (2008) argues that verbal text plays only an ancillary role in support of nonverbal interactions.

More recently, Jones's interest in CMC and multimodal discourse has shifted from the "site of attention" to the "site of display," more specifically, the computer-mediated multimodal representations of human bodies, which he calls "bodies without organs," giving

a new meaning to the term coined by Deleuze (Jones, 2009a, 2009b, 2009c, in press-a). Examining social networking sites for gays and lesbians, Jones (2009b, 2009c) discusses the wide range of staging and viewing tools that participants employ in the production of an attractive profile. He argues that “a ‘site of display’ consists of more than just what is displayed. It is an interaction between the display and those who use it” (2009c, p. 114). Turning to the skateboarders in Hong Kong, Jones (2009a, in press-b) outlines the various functions of the bodies without organs. Looking at online skateboarding videos and, more importantly, the skateboarding and technological actions which went into the production of the videos, Jones argues that the bodies without organs have profound impacts on the skateboarders’ physical bodies. As reflective and anticipatory tools, these skateboarding videos simultaneously showcase past achievements and motivate them to practice and perfect future movements.

Synthesizing his research in these different areas, Jones (in press-a) reminds us of the importance of understanding action in the study of language and discourse. In this sense, his work is relevant not only for researchers doing multimodal discourse analysis but also for anyone interested in language as *used* by people.

Kachru, Braj B.

CECIL L. NELSON

Braj B. (Behari) Kachru was born in Srinagar, Kashmir, India, in 1932. “Kachru,” by the way, is an Englishization of his name, which is from the Kashmiri word *katsur*, “brown.” His family are Pandits (from Sanskrit *paṇḍit*, “learnèd man, scholar”); that is, he is by heritage as well as by inclination a seeker after rational explanations and a willing instructor of willing students.

Professor Kachru’s first-acquired language was Kashmiri. Because of a medical misdiagnosis, he did not attend school as a boy. He was tutored at home in low-pressure pursuits, including painting and Hindi. He started learning English as a teenager. In 1949 he entered Sri Pratap College in Srinagar; he graduated from the newly established Jammu and Kashmir University in 1953 with an honors degree in English, having also studied English and Sanskrit at Amar Singh College in Srinagar. In 1955, he received his MA in English literature and language from Allahabad University in Uttar Pradesh, India. It was there that one of his teachers, the late P. E. Dustoor, motivated a change in his intellectual focus from literature to language study. This shift notwithstanding, Professor Kachru’s love of literature has remained strong throughout his life, as witness his book currently in progress on the Kashmiri poet Dina Nath “Nādim.”

After his MA at Allahabad, Professor Kachru attended linguistic institutes in Poona (now Pune), where he came into contact with scholars who are among the founders of linguistics as it is known today, including William Bright, Gordon Fairbanks, Charles Ferguson, and John Gumperz. In 1957, he was appointed a fellow of the Deccan College Research Institute for linguistics, and studied under Henry Gleason. It was here, reports Professor Kachru (1992b, p. 68), that he began “to think seriously about Indian English; its status, roles, and academic position.”

In 1958, Professor Kachru was selected by the British Council in New Delhi to join the school of applied linguistics at the University of Edinburgh. His teachers there included distinguished linguists: David Abercrombie, J. C. Catford, M. A. K. Halliday, Peter Ladefoged, Angus McIntosh, and Peter Strevens—and, very importantly, J. R. Firth, who was a visiting professor. Firth’s influence was apparent in Professor Kachru’s attention to context and contextualization in his emerging sociolinguistic view of English in India, and later in its other varieties across the world. He completed his PhD thesis, “An Analysis of Some Features of Indian English: A Study in Linguistic Method,” in 1962. His fellow students at Edinburgh included others who are now among those frequently referenced in theoretical and applied linguistics literature, such as Ayo Bamgboṣe, Ruqaiya Hasan, and Rodney Huddleston.

Before Professor Kachru’s graduation from Edinburgh, there occurred a chance meeting which turned out to shape the course of his next steps in his fields of study and, by extension, the lives of generations of future students. The late Robert Lees, then the head of the linguistics program in the department of English at the University of Illinois (Urbana, USA), gave a lecture at Edinburgh in 1961. Graduate student Kachru attended the talk and was among the select group who went out to dinner with Lees that evening. Lees had a reputation (which he had reinforced in his interactions at Edinburgh) for a certain forcefulness in his expressions of his views and beliefs. Professor Kachru apparently gave as good

as he got in the evening's discussions. Not long after, Lees wrote to Halliday asking for his recommendations for possible candidates for a position at the University of Illinois, and, in particular, he wondered if "the Indian boy" who had gone to dinner with them would be interested in it (Kachru, 1992b, p. 71). Following the completion of his PhD and after an intervening year during which Professor Kachru fulfilled a commitment to teach at Lucknow University in India, he joined the University of Illinois program, later to become the Linguistics Department, in 1963, and subsequently became a force in the building and direction of the unit until his retirement from teaching and departmental duties in 2002. This chain of events was the start of his life long devotion and attachment to the university and to its university-town setting. (Indeed, his Illinois automobile license plate designation is "BBK 63.")

Professor Kachru assumed the chair of the linguistics department in 1969. In a posthumously published retrospective article on the history of linguistics at the University of Illinois, the venerable Henry Kahane wrote a telling line about "Braj Kachru, our sociolinguist, who with extraordinary energy and never-failing gentlemanliness steered the department from its modest beginnings to a complex and flourishing University unit" (Kahane, 1992, p. 39).

Professor Kachru may justly be called the progenitor of the school of thought now widely recognized under the label "World Englishes." Since the end of World War II, with the rush to "independence" of former colonized countries such as India, where the English language was solidly established in bureaucracies and education systems, English had assumed its role as a global language of wider communication. With his publication in 1965 of an article in *Word* entitled "The Indianness in Indian English," Professor Kachru began the evolution of "sociolinguistically realistic" observations and interpretations (see the title of his 1985 paper) of the features and functions of varieties of English around the world. He often has pointed out, with a smile, that "If I ask for tea, and I get tea, my English must be working." His arguments were persuasive to great numbers of professional colleagues and, of course, to his many PhD students.

Among his numerous awards and important positions, two clearly stand out for Professor Kachru himself. He was selected as a member of the University of Illinois Center for Advanced Study, and served as its director from 1996 to 2000. And he was designated Jubilee Professor of Liberal Arts and Sciences in 1992.

Two conferences in 1978, one in April at the East-West Culture Learning Institute, Honolulu, organized by Larry E. Smith (see Smith, 1981), and the other in June/July at the Linguistic Society of America Institute at the University of Illinois, organized by Professor Kachru, resulted in publications which formed the bases for the study of World Englishes today. Papers presented at the Illinois conference appeared in the edited volumes *The Other Tongue: English Across Cultures* (Kachru, 1982, and a substantially revised second edition, Kachru, 1992a). That this work's second edition is still in print and widely used is a testament to the fundamental character of its aims and of its presentations. Those are just two, albeit important, items in the long list of Professor Kachru's publications. Substantial collections of his own work are in his volumes *The Indianization of English* (1983) and *The Alchemy of English* (1986), the latter of which was awarded joint first prize in the Duke of Edinburgh competition in 1987. Among his most recent publications to date are the monograph *Asian Englishes: Beyond the Canon* (2005) and the coedited *Handbook of World Englishes* (2006). Altogether, he has authored and edited over 25 books, and has written well over one hundred papers, articles, and reviews. A much sought-after speaker at professional conferences, he has presented papers and plenary and keynote addresses at meetings of every notable organization having to do with language and English studies across the world.

Professor Kachru and his close colleague Larry E. Smith founded the influential journal *World Englishes* in 1985 (as volume 4, issue number 2, assuming the editorship and changing

the name from the former *World Language English*; see Kachru & Smith, 1985), and an organization for students and professionals in World Englishes studies, the International Association for World Englishes, in 1992 (see Kachru, 1997).

Professor Kachru met his life partner and professional collaborator, Professor Yamuna (Keskar) Kachru, in 1957 in Dehradun, Uttar Pradesh, India, at the Summer Institute of Linguistics. She joined him and the faculty at the University of Illinois in 1965, and they have been institutions, severally and jointly, within that institution for going on five decades. The Kachrus have two children: Amita, a medical doctor, and Shamit, a research physicist.

This printed sketch cannot possibly come close to capturing the stimulation, intellectual workout, and often, pure fun and entertainment of sitting with Professor Kachru as *guru* or as social conversationalist (the roles are often indistinguishable) in the living room of the Kachrus' home on the southeast side of Urbana. Those students fortunate enough to have had those experiences surely regard them as among the most important shaping forces in their lives. The gentlemanliness that Kahane's expression of appreciation referred to comes through in all of Professor Kachru's dealings with friends, colleagues, and students. While he may have professional opponents, and even occasionally detractors, it is safe to say that he has no enemies. No one can fail to be embraced by his good humor combined with unassailable intelligence. A force in applied linguistics, Professor Kachru continues to shape the paths of the fields in which he works.

Kachru, Yamuna

LARRY E. SMITH

Yamuna (Keskar) Kachru was born in Purulia (now in West Bengal) on March 5, 1933 where her father was a medical practitioner. She grew up in United Provinces and Bihar states in a traditional Maharashtrian Brahmin household. Her mother tongue was Marathi but she also became fluent in Hindi, Bengali, and English. As an aside, she comments that her English sounds “bookish” because that is how she learned it—from books! She was always an outstanding student, completing her BA from Bihar University in 1953 and her MA in Hindi language and literature from Patna University in 1955 where she was awarded two gold medals for excellence.

Yamuna was invited to teach at the University of London School of Oriental and African Studies in 1959. She taught and conducted research on Hindi there and was awarded a PhD degree in linguistics in 1965. The topic of her thesis, which was the first analysis of Hindi based on the Chomskyan model, was *A Transformational Treatment of Hindi Verbal Syntax* (1965).

In 1965 Yamuna was invited to join the Department of Linguistics and the Division of English as an International Language at the University of Illinois at Urbana-Champaign and remained there until she took early retirement in 1999 so that she could devote full time to research and writing. While on faculty she wrote a number of books and over fifty research papers on various aspects of Hindi grammatical structure. In addition to her research, Yamuna was active in teaching Hindi to speakers of other languages. Her work has inspired other scholars to produce many linguistic descriptions of Hindi at universities all over the world. She has also conducted typological research on other Indian languages, including Bengali, English, Kashmiri, Marathi, and Urdu. Her coedited book with Braj B. Kachru and S. N. Sridhar, *Language in South Asia* (2008), reflects some of this work. Because of her recognized scholarly promotion of Hindi and distinguished career in linguistics, she was given the prestigious Presidential Award from the President of India in New Delhi on September 14, 2006.

Yamuna was also active in the training of teachers in the MA in teaching English as a second language program at the University of Illinois. Her work on Indian English, English as an international language, and World Englishes is equally impressive. She is particularly well known for her research on conventions of politeness, communicative styles, contrastive rhetoric, discourse strategies, discourse interpretation, and speech acts in World Englishes. The celebrated *Handbook of World Englishes*, coedited with Braj B. Kachru and Cecil L. Nelson, was published in 2006; her coauthored book with Cecil L. Nelson, *World Englishes in Asian Contexts*, was published in 2006; and her coauthored book with Larry E. Smith, *Cultures, Contexts, and World Englishes*, was published in 2008.

Yamuna and her husband Braj B. Kachru are the founding pillars of the International Association for World Englishes (IAWE) and the organization’s professional journal, *World Englishes: Journal of English as an International and Intranational Language*. They continue to provide direction and inspiration for both.

Yamuna takes great pride and interest in her students. More than forty scholars have completed their PhD under her supervision. All report that they consider themselves blessed to have had the opportunity to study under such a brilliant, supportive, and open-hearted scholar.

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

DOI: 10.1002/9781405198431.wbeal1331

Yamuna's greatest joy clearly is from being the wife of Braj B. Kachru, the mother of Amita (a medical doctor) and Shamit (a physicist), and the grandmother of Sasha and Ila.

Kasper, Gabriele

ALFRED RUE BURCH

Gabriele Kasper (1948–) is a professor of second language studies at the University of Hawai'i at Mānoa. She is a noted scholar in the field of interlanguage pragmatics, and has been cited as a major figure in the ongoing shift from cognitivist/rationalist perspectives in second language acquisition (SLA) to more socially grounded approaches.

While completing her doctoral degree at Ruhr-Universität Bochum, she conducted work with Willis Edmondson, Juliane House, and Brigitte Stemmer which drew upon diverse theoretical strands such as universal pragmatics, speech act theory, conversation analysis, and other forms of discourse analysis in order to examine the communicative competence of German learners of English after following a standard curriculum, and also laid the groundwork for the field that would come to be known as interlanguage pragmatics (ILP) (Edmondson, House, Kasper, & Stemmer, 1984). Her dissertation, completed in 1980 and published as a book in 1981, focused on first language (L1), second language (L2), and interlanguage interaction, and extended Selinker's (1972) notions of transfer, overgeneralization, and "transfer of training" in interlanguage performance into the study of L2 pragmatics.

From 1981 to 1988, Kasper taught in the Department of Linguistics at Åarhus Universitet in Denmark, where she began an extensive collaboration with Claus Færch (University of Copenhagen). Her work with Færch melded psycholinguistic and discursive perspectives on second language learning and use, leading to books on communication strategies (Færch & Kasper, 1983) and verbal report in second language research (Færch & Kasper, 1987), as well as a number of book chapters and articles on topics such as language transfer, comprehension, and management of discourse in the foreign language classroom. During this time, she also became involved in the Cross-Cultural Speech Act Realization Project (CCSARP) with Shoshana Blum-Kulka (Hebrew University of Jerusalem) and Elite Olshtain (Tel Aviv University), which examined how the production formats of requests and apologies vary situationally and cross-culturally across 10 languages and language varieties. The project implemented the Discourse Completion Test (DCT) and developed a coding scheme for examining these speech acts (Blum-Kulka, House, & Kasper, 1989) which has been highly influential in L2 pragmatics research, and led to publications on the production of requests by L1 speakers of Danish and German in L2 English and L1 speakers of Danish in L2 German.

After Claus Færch's untimely passing in 1987, Kasper moved to the Department of English as a Second Language (now Second Language Studies) at the University of Hawai'i at Mānoa, first as a visiting professor (1988–9), and then as a permanent faculty member from 1989. Her arrival coincided with the establishment of one of the first federally funded National Foreign Language Resource Centers (NFLRC) at the University of Hawai'i and the launch of the ESL Department's doctoral program in second language acquisition. These events had a profound impact on the direction of Kasper's research, as her students' interests and backgrounds in East Asian and Southeast Asian languages opened new avenues of inquiry for research on pragmatics. The NFLRC, with a mission to develop resources for the teaching of "less commonly taught languages," provided an infrastructure in which Kasper and her students could explore pragmatics in Japanese and Chinese, as

well as L2 English by speakers of those and other languages. The early NFLRC-supported research led to studies on pragmatic transfer and the relationship between assessment and the production of apologies, L1 and L2 pragmatics in Japanese and Chinese, and on ILP data collection methods (Kasper & Dahl, 1991), an area on which she has continued to work (Kasper & Rose, 2002; Kasper, 2008).

Kasper and Blum-Kulka's (1993) coedited volume *Interlanguage Pragmatics* gave name to the field that she had helped to develop over the previous 17 years, establishing a productive research focus on interlanguage use. Her tenure as a visiting professor at Temple University in Tokyo (1993–4) introduced researchers in Japan to the field of ILP. During the latter half of the decade, Kasper moved away from comparative studies in pragmatics toward a focus on the development of pragmatic ability (Kasper, 2001). Her work with Richard Schmidt (Kasper & Schmidt, 1996) helped to bring ILP into the wider SLA mainstream by extending traditional SLA routes of inquiry to pragmatic development, while her work with Kenneth Rose (City University, Hong Kong) extensively reviewed work on key topics in ILP development (Kasper & Rose, 2002) and examined instructed learning of L2 pragmatics (Rose & Kasper, 2001).

Kasper's work on L2 oral proficiency interviews (House, Kasper, & Ross, 2003) introduced a new direction in her research as she turned to conversation analysis (CA) for the examination of how interviewers design questions (Kasper, 2006). This turn led to extensive work using CA, including research in the classroom (Tateyama & Kasper, 2008) and outside (Kasper, 2004). In this line of work, Kasper has recently explored issues such as conceptualizing and demonstrating L2 language learning and development with CA, the role of extraneous theory in CA for SLA, re-specifying cognition and affect in CA and discursive psychology, CA's potential for critical analysis, and the use of CA for qualitative research in applied linguistics (Markee & Kasper, 2004; Kasper, 2009; Kasper & Wagner, 2011). Her recent coedited volume with Hanh thi Nguyen (Nguyen & Kasper, 2009) continues her contribution to this ongoing research program.

Kniffka, Hannes

BLAKE STEPHEN HOWALD

Hannes Kniffka (1942–) is emeritus professor of general linguistics at the University of Bonn, Germany. Kniffka's research and scholarship focus on numerous aspects of *forensic linguistics*—where language, and the linguistic analysis thereof, is evidence in a given legal proceeding—including authorship analysis, threat, and defamation analysis. *Working in language and law: A German perspective* (2007) summarizes several approaches to defamation analysis (Kniffka, 2007, chap. 5) and authorship analysis (Kniffka, 2007, chaps. 6–8). Kniffka employs various methodologies based in general theoretical linguistics and anthropological and sociolinguistics; (e.g., semantics [lexical], pragmatics [speech acts (Austin, 1962), Gricean implicature (Grice, 1975)], syntax, onomastics [names], terminology, and text linguistics). In terms of defamation, Kniffka illustrates how determining whether an utterance is an untruth (or merely insulting) requires attention to individual interactive and cultural elements. For authorship analysis, Kniffka possesses a principled and systematic perspective. In particular, Kniffka's treatment of orthographic data and other sociologically based aspects of language (punctuation, prescriptive grammar), which have proven to be problematic in authorship analysis (e.g., Chaski, 2001), is well balanced, insightful, and effective. The importance of this work cannot be overstated as participants to the legal system are often asked to analyze language—giving their thoughts, impressions, and assumptions on a disputed issue. Kniffka's research has worked to ensure proper understanding of linguistics is brought to the legal forum.

Beyond particular linguistic analyses and applications, Kniffka has made significant contributions to overarching policies in the *practice* of forensic linguistics (e.g., linguistic conduct in legal proceedings and the legal system's response to linguistics). The practice of forensic linguistics investigates the legal parameters, rules, and procedures that govern the application of linguistics (and any science) in legal proceedings. Kniffka's published work in this aspect of forensic linguistics (especially in the German legal system) appeared as early as 1981 and included such topics as expert testimony (Kniffka, 1981, 1994), interdisciplinary relationships with law enforcement and other forensic sciences (Kniffka, 1989), ethical considerations (Kniffka, 1993a), and general theories and methodologies (Kniffka, 1990, 1993b). Much of this work predates any other works of this kind in any jurisdiction and is of primary concern for any scientist interacting in the legal system (many of Kniffka's policy insights are summarized in *Working in language and law* as well). Kniffka (1981) is in fact the first scientific description of linguistic expert testimony in court, providing a systematic perspective based on opinions given in German courts in the 1970s.

Kniffka received his PhD in linguistics from the University of Bonn in 1968 (general linguistics, historical and comparative linguistics, Indic philology). During his PhD studies, Kniffka was a fellow of the German National Academic Foundation. Kniffka attended Stanford University and was advised by Charles A. Ferguson from 1968 to 1970 on a postdoctoral fellowship of the Education Foundation of the German People (Studienstiftung des deutschen Volkes). After a fire destroyed his belongings in 1970, including two book manuscripts, Kniffka was an instructor at the Defense Language Institute in Monterey, California, and an instructor in Classical Greek at California State University at Hayward from 1970 to 1972. Back in Germany, Kniffka was an assistant professor at the Institute

for German Language and Literature at the University of Cologne from 1972 to 1981. There he also did his “Habilitation” in general linguistics with Hans-Jakob Seiler.

Kniffka was a professor of linguistics, German, and English at the King Abdul Aziz University in Jeddah, Saudi Arabia from 1981 to 1987, a lecturer in German linguistics at the German School of Shanghai International Studies University, Shanghai, PR China from 1987 to 1988 and a professor at the University of Bonn from 1989 to 2008. Kniffka is active in the forensic and broader applied linguistic community; regularly giving conference presentations and organizing panels at the International Association of Forensic Linguists (IAFL) and the Association Internationale de Linguistique Appliquée (AILA) conferences. Kniffka is a founding member of the IAFL and organized its first international conference at Bonn University in 1993. Kniffka also organized the first “forensic linguistics” session of AILA in Amsterdam in 1993. He is also a founding member of International Language and Law Association (ILLA).

Knowledge Claims

TRINE DAHL

Knowledge claims are very basic units in research communication. However, to provide a concise definition of the concept *knowledge claim* is not so easy. We may consider it as a mental construct that is verbalized in speech or writing and which relates to a specific field of knowledge. In applied linguistics, knowledge claims are central to all investigations of texts involving research. We may, for example, consider how historians and political scientists present their findings (the basis for new knowledge claims) in the genre of the research article: Are the findings presented in a bold (unhedged) or more tentative (hedged) form? Or, we may compare how historians and political scientists deal with previous research (representing currently accepted knowledge) cited in their articles: Is it openly criticized, or rather outlined in a more neutral way? Knowledge claims are studied within several theoretical frameworks, by means of various methodological approaches, and in terms of a number of different pragmatic and linguistic aspects. This entry will present knowledge claims in relation to the following issues: (a) different assumptions about knowledge, (b) textual and linguistic features associated with knowledge communication, and (c) how knowledge claims are researched in applied linguistics.

Different Assumptions About Knowledge

The link between a particular knowledge claim and a knowledge field (representing the basis for an academic discipline) implies that the nature of the claim is related to the nature of the knowledge which is represented in the cognitive territory (Becher & Trowler, 2001) we are dealing with. While some elements of scientific arguments may be said to be field-invariant (Toulmin, 1958), others are field-dependent. All fields make use of data to draw conclusions. The nature of the data, however, may vary. Therefore, what counts as knowledge to some extent varies with the disciplines we study. Claims which are formulated in research-based texts may rest on quantitative or qualitative observations (or both), or on more subjective insights. In a natural science discipline like medicine, for example, knowledge production is often linked to large-scale statistically based studies. Thus, in a medical report, the claim that smoking causes cancer will be based on numerical data showing a significant difference in the occurrences of cancer in the smoker and the non smoker groups. In social science disciplines, for example economics, new knowledge may come from specific constellations of arguments that are fact-based or fact-backed. A paper dealing with the topic of unemployment will typically make use of statistics. But the economist must also explain why the computer model used in the study is based on a particular combination of "social" factors which may be relevant for unemployment, for example gender, education, wage levels, or labor mobility. In humanities disciplines, for example philosophy, researchers to some extent draw on subjective perceptions. In a philosophy essay, therefore, the philosopher's way of arguing for a claim will be different from what we find in natural and social science, because the research questions are different: Issues like "How do we know what we know?" and "What is ethical or moral behavior?" must be dealt with by means of research methods other than those used in medicine and economics.

2 KNOWLEDGE CLAIMS

What we at a given point in time consider to be the content of a discipline represents knowledge that has gained acceptance in the associated research community over time. New claims may challenge this common knowledge base. A new claim may lead to modifications of the base if it is found to be more valid than the old one: The earth is flat → *the earth is round*. In other cases, a new claim modifies an old claim: Smoking is dangerous, not only to smokers, *but also to nonsmokers exposed to cigarette smoke*. Sometimes, new claims expand the knowledge base, because the research deals with aspects which have not been studied before. This happened, for example, when the development of magnetic resonance imaging (MRI) technology in medicine made it possible to observe brain activity directly. In linguistics, the availability of powerful computers has made it possible in recent years to establish and search large electronic corpora. Computer linguists are therefore now able to reveal patterns of regularity regarding linguistic phenomena which manual investigations of texts could not provide.

In the positivist tradition of science—which was long prevalent (and to some extent still is) in the natural sciences and many social science disciplines—what counted as knowledge were phenomena that we could observe and then describe in an objective way. In the late 19th century, the philosophical movement of pragmatism (Peirce, 1905), and some decades later, the postpositivist view of what knowledge is, gained ground. In these approaches to scientific activity, observations are not objective, but dependent on current theory as well as the observer's cultural experiences. Therefore, knowledge cannot be separated from the culture and context in which it evolves. This change in the view of science also had implications for how we look upon knowledge representation in texts. In the rhetoric of science tradition, Bazerman (1981) gave the following description of the relationship between knowledge and text: "Texts bring together worlds of reality, mind, tradition, and society in complex and varying configurations, and knowledge is in those words that sit in the middle" (p. 379). Today most applied linguists, to varying degrees, take a social constructionist approach to knowledge communication. This implies that individuals (academics) learn to become fully fledged and competent members of particular sociocultural groups (research communities) through active participation in the language-based practices which the groups are involved in. As "academics work within communities in a particular time and place . . . it is this intellectual climate which determines the problems they investigate, the methods they employ, the results they see and the ways they write them up" (Hyland, 2009, p. 12). In this perspective, the text becomes a site for interaction where knowledge is co-constructed between writer and reader. In applied linguistics, the branches of pragmatics and discourse analysis represent particularly useful approaches to bring out salient features of textual knowledge construction. Most studies have a pedagogical aim: How can newcomers to an academic field present their research contribution in a manner that is acceptable and convincing in terms of the reporting practices of the discipline?

Textual and Linguistic Features Associated With Knowledge Communication

Knowledge claims have mainly been studied in written genres. In the genres of the research article and the scientific report, the academic writer focuses on the presentation of his or her new claim. In book reviews, the writer's claim is directly based on the assessment of someone else's claim. Knowledge claims are also the foundation of the pedagogical genre of the textbook. Put simply, textbooks report the current state of knowledge, that is, the aggregate of accepted knowledge claims in a field. In recent years, the development of spoken corpora such as for example MICASE (Simpson, Briggs, Ovens, & Swales, 1999) has made it easier to study how knowledge is communicated in oral genres, such as the university lecture (Ädel, 2008) and the conference presentation (Rowley-Jolivet, 2002).

In most academic disciplines, the research article (RA) is the most important genre for creating new knowledge. Previously, the writer's claim (or claims) tended to be presented only in the discussion section(s) of the RA. In recent years, the trend in many disciplines has been also to introduce the reader to the claim at some point early in the text. Swales and Najjar (1987) reported that in physics it had become increasingly common to mention the principal findings in the introduction section of the article. Berkenkotter and Huckin (1995) confirmed this development in their study of other science disciplines and stated that "the introduction occupies the same physical location it always has, but it contains much more bottom-line results than it used to" (p. 35). They likened RA introductions to news reports and suggested that since academics have become increasingly pressed for time, they need to be informed early in the text of items which carry high news value. This enables them to decide quickly whether the whole text is worth reading or not. Later studies have arrived at similar results for yet other disciplines (Swales, 2004). RA titles have also become more informative, and they may even take the form of complete sentences (Berkenkotter & Huckin, 1995). In the natural sciences, the title in fact sometimes represents the full claim made in the paper: "Spatial awareness is a function of the temporal not the posterior parietal lobe" (from an article published in *Nature*, cited in Fahnestock, 2004, p. 20) or " Cu^{2+} ions interact with cell membranes" (from an article published in *Journal of Inorganic Biochemistry*, cited in Haggan, 2004, p. 296).

The interpersonal aspect of knowledge construction implies that much research focuses on identifying linguistic manifestations of the interaction between writer and reader in the text, as well as the pragmatic function these various linguistic traces have. In many social science and humanities disciplines, the negotiation of knowledge entails a writer who is visible, at least in the Anglo-American writing tradition (Hyland, 2005). In such disciplines, academic writers may introduce the claim by *We find that . . .* and *I argue that. . .* In the natural sciences, on the other hand, writers have a less prominent place in the textual knowledge construction process. It is the procedures and the data that speak, and therefore it is not *we* or *I*, but *the data* which *show that. . .* Another reflection of an active and involved writer is the use of metatextual devices to make sure that the reader immediately notices the new claim. Expressions such as *The main contribution of this paper is that . . .* and *Our key finding is that . . .* serve the function of drawing attention to the knowledge claim. Advocacy of the newsworthiness and importance of the claim is also a rhetorical strategy that writers in many disciplines make use of today. An increasing amount of self-promotion by means of evaluative statements such as *These studies provide the first empirical evidence that . . .* and *That [x is the case] is an important finding, because . . .* (Lindeberg, 2004; Hyland, 2009) indicates that academic knowledge communication is taking on features which are more typically associated with commercial marketing techniques.

Yet another aspect that is considered in linguistic analyses of knowledge claims is the strength of the claim. In the two RA titles cited above, the claim is boldly presented: *. . . is a function of, . . . ions interact with*. No reservations, *this is* the case. However, new knowledge claims are often presented in a more tentative manner by means of hedging devices such as modal verbs, adjectives, adverbs, and so forth. Thus, the outcome of a study *seems to indicate that . . .* and findings *may possibly be interpreted as . . .* In some cases, of course, the hedging is a reflection of the fact that the claim cannot be categorically stated. It may be based on incomplete data; the methods used in the study may be imperfect, etc. Tentative claim making has also more generally been considered as a politeness strategy (Myers, 1989). In such a framework, an unhedged claim may represent a face-threatening act. In other frameworks, hedging is seen as a reflection of the interactive negotiation process: The writer allows the reader to decide whether the claim is acceptable (e.g., Hyland, 1998).

To anticipate and assess the reader's reactions is an important part of the writing process, both when writer and reader share the same knowledge background and when they

do not. In the latter case, the communication situation is characterized by knowledge asymmetry. The academic writer must then adapt the presentation of the claim to a less specialized or even nonspecialist audience that lacks the appropriate knowledge background for understanding the claim. Such situations occur when new research on issues of general interest, for example global warming, is presented to government decision makers or members of the general public. Claims in policy reports and popular science magazines are communicated by means of very different textual strategies than those used in the technical and scientific papers intended for the writer's peers. What happens to claims in such adaptation processes is discussed in, for example, Fahnestock (1986). In another paper (Fahnestock, 2004), the focus is on "how a scientific argument can be adapted for different audiences with different needs, interests and background knowledge and yet remain recognizably the same argument" (p. 8). This implies that we should not only study changes between versions; "It may also be worthwhile to ask what stays the same" (p. 9).

How Knowledge Claims Are Researched in Applied Linguistics

The various aspects of claim construction and communication mentioned in the first two sections of this entry are all relevant for studies in applied linguistics. The basic approach taken in many studies is *comparison* of texts that differ with respect to one or more variables. The most common variables are genre, discipline, and language. Knowledge construction in the research article may be compared with that of the book review (e.g., Hyland, 2000). Within the genre of the research article, one discipline may be compared with that of another (e.g., Holmes, 1997, on history, political science, and sociology; Fløttum, Dahl, & Kinn, 2006, on medicine, economics and linguistics). In terms of the language variable, a number of different research scenarios may be established. Due to the unique position of the English language in the global research community, we often compare English texts (written by native or non-native speakers) with texts in other languages (e.g., Fløttum et al., 2006, on English, French, and Norwegian). We may also focus on how individual scholars present and argue for their research contribution. The scholars who are singled out for such case studies are typically those who have played a major role in their field. Hyland (2008), for example, considers the prose style of John Swales, one of the most influential people in the field of English for academic purposes. Hyland finds Swales's writing to be "not the faceless discourse which academic prose is often caricatured to be, but a style of writing infused with the subjectivity of a writer making decisions, weighing evidence and drawing conclusions" (p. 146). Gotti (2009), in a study of the economist John Maynard Keynes's style in his classic book *General Theory*, concludes that "Keynes did not always shape his arguments in a way that would meet the standard expectations of his readership" (p. 298). Such studies of individual writers show that the generic and linguistic conventions which are established through investigations of academic discourse are not absolutes. There is room for developing a personal voice.

In terms of theoretical framework, genre theory (Swales, 1990) is used in many studies that involve knowledge construction. Genre studies focus on how writers within various disciplines exploit a particular text format or schema, and how argumentation patterns and rhetorical strategies may change in response to changes in the communities where the genre is used as a vehicle of knowledge dissemination. The observation (mentioned in the second section of this entry)—that, due to changed information needs, writers in many disciplines now present the new claim in the introduction section of the RA—represents such a study. The participatory aspect of knowledge communication is accommodated within the conceptual framework of metadiscourse (Hyland, 2005). This framework deals with discourse features that relate to the interaction between writer and reader (e.g.,

the use of personal pronouns and metatext) and that contribute to building rapport between the communication partners. The somewhat elusive notion of evaluation (Hunston & Thompson, 2000) is also relevant to the study of knowledge claims, for example to describe the process of situating new knowledge in relation to old: *While Jones (2006) only considers . . . , our findings are based on . . .* (e.g., Lindeberg, 2004). In such cases the writer uses comparison, which is one of the most basic elements in evaluation, together with promotion to demonstrate that the new knowledge is superior to the old.

In terms of methodology, the development of large electronic corpora and of specific corpus linguistic methods have made it possible to carry out quantitative analyses of linguistic phenomena in representative collections of entire texts. Statistical tests, typically based on frequencies, are applied to the data to support or reject hypotheses about tendencies in linguistic practices. However, it is a problem that knowledge claims are realized linguistically in a number of different ways. In addition, there is no general agreement on the kind of unit that represents a claim. In the context of the research article, it has been described as “an item . . . which the writer puts forward to be added to the sum of knowledge agreed upon by the community of that discipline” (Hunston, 1993, p. 133, note 2). This “item” may be a proposition (Myers, 1992), or an argument which is constructed over several propositions (Dahl, 2008). Due to the lack of a structurally well-defined search unit, it is usually necessary to include manual stages, even in analyses which are based primarily on automated corpus searches. One example of such an analysis is a search procedure with a point of departure in words which writers typically use to signal knowledge claims. Nouns like *finding* and *result* and verbs like *argue* and *suggest* commonly serve this function. However, it may not be possible to rely on such a simple search procedure alone. In a research text several “voices” are present. In addition to the writer’s voice, other researchers’ voices are included, most commonly through citations when the writer is positioning the new claim in relation to what others have claimed. Thus, the verb *argue* refers to the writer’s own claim when it occurs in combinations with a first person pronoun: *In this paper, we argue that. . .* In combination with a third-person pronoun or proper name, on the other hand, the verb refers to claims made by others: *He/Smith (2009) argues that. . .* Therefore, single-word search procedures may have to be refined to include combination searches. In most cases, it is still necessary for the applied linguist to read through the corpus texts in order to make sure that all the claims which are relevant for a particular investigation have been identified. Manual stages are also required in the analysis phase to identify the pragmatic function of, for example, hedging in the claim presentation process. Since applied linguists often study texts from knowledge areas where they themselves are not experts, qualitative methods such as questionnaires and interviews with the academic writers are useful to uncover the pragmatic intentions behind the knowledge claim features which are identified in a corpus-based analysis (e.g., Hyland, 2002; Dahl, 2009).

Kramsch, Claire

PAIGE WARE

Claire Kramsch is an international scholar whose fields of interest include second language acquisition, applied linguistics, discourse analysis, social and cultural theory, multilingualism, and the applications of each field to language teaching and learning. Colleagues point to Kramsch as a key voice in helping to shift the field of foreign and second language teaching and learning from a focus on structures and strategies to include a much more complex intertwining of culture, discourse, power, literacy, pragmatics, semantics, and ideologies. Over the last 30 years, her scholarly work has provided the field with theoretical and empirical writings that bring these various interdisciplinary lenses into mainstream discussions of language acquisition. She has introduced constructs such as “third place” (Kramsch, 1993), “third culture” (Kramsch, 2009c), and “symbolic competence” (Kramsch, 2006), all of which allow educators and researchers to grapple with changing conceptions of what it means to learn and teach languages in an increasingly multilingual, multicultural, and multimodal world. Themes in her work include an insistence that language not be taught or conceived as separate from culture (Kramsch, 1993, 1998, 2009a; Kramsch & Thorne, 2002); that literature and language be viewed as mutually informing and interdependent (Kramsch, 2000); and that symbolic and historical aspects of language and their centrality in maintaining existing relations of power be made central within an ecological approach to language use and learning (Kramsch, 2008a, 2009c; Kramsch & Whiteside, 2007, 2008). Across all themes, Kramsch grounds her ideas in the experiences of language learners and teachers as they are situated within classroom, institutional, social, cultural, political, and ideological contexts and forces.

Kramsch completed her studies in German language and literature at the Université de Paris-Sorbonne in 1959. She then moved to Germany, where she taught French at the Institut Français in Freiburg before emigrating to the United States. For 23 years, her first academic home in the US was at the Massachusetts Institute of Technology, during which time her tenure included several years as a German professor and as the head of the Department of Foreign Languages and Literatures. In 1989, she accepted a position as Full Professor in the Department of German at the University of California at Berkeley, and three years later was offered also an affiliate professorship in the Graduate School of Education. While anchored professionally at UC Berkeley, Kramsch has also been a visiting professor at the University of Jyväskylä in Finland, the University of Vienna in Austria, the University of Michigan, Penn State University, Cornell University, the University of Arizona, and the Interuniversity Center in Yugoslavia.

A close reading of the intellectual influences behind Kramsch’s work is provided in her biographical memoir of Pierre Bourdieu (Kramsch, 2008b), in which she traces his life and work by using her own biographical trajectory as an interpretive lens. In this account, she describes how she, like Bourdieu, began her career in the study of philosophy in France, but eventually began to critically reflect on the training she had received. In a thoughtful and intimate recounting of events, she describes both her physical relocation from Europe to the United States, as well as the intellectual shifts that resulted from pivotal influences such as the experience of reading Bourdieu while teaching at MIT. She develops the notion of a reflexive, or Bourdieusian, stance to research, in which “researchers make explicit

whom or what they are directing their research against, what social and personal factors have triggered their research interests, what institutional and political conditions of possibility have made their object of study into what it is" (Kramsch, 2008b, p. 45).

Such an ethically aware, grounded stance is very much alive in Kramsch's work. The sheer volume of her scholarly writing is impressive: 11 authored or edited books, 68 refereed journal articles, and 79 chapters. Those familiar with her work would smile at the bureaucratic flavor of such a numerical accounting of her publications, as she is known for challenging reductionism. She argues against a primary focus in language education on quantifiable results, instrumental goals, and metaphors of efficiency. Instead, she has offered the field decades of thought-provoking and pivotal pieces that have done much to shift the course of language education toward more complex, situated views of language, communication, culture, and power.

Almost 20 years ago, her book *Context and Culture in Language Teaching* (1993) helped articulate unease in the field that language teaching was becoming too divorced from context. In this book, she criticized traditional views of language that put faith in universal meanings and in an idealized native speaker, and she instead advocated an approach "more interested in fault lines than in smooth landscapes, in the recognition of complexity and in the tolerance of ambiguity, not in the search for clear yardsticks of competence or insurances against pedagogical malpractice" (1993, pp. 1–2). Her carefully laid out argument, punctuated by classroom examples, caught fire among colleagues and helped usher in a focus on context, variability, and difference. She also proposed the theoretical construct of a "third place" that "preserves the diversity of styles, purposes, and interests among learners, and the variety of local educational cultures" (p. 247). The book's contribution to the field was acknowledged in 2009 with the coveted Modern Language Association (MLA) Kenneth Mildenberger Prize, which honors book-length contributions to the fields of language, literacy, culture, and literature that carry implications for teaching foreign languages.

More recently, Kramsch has written about *symbolic competence*, a construct that, as she explains, "does not do away with the ability to express, interpret, and negotiate meanings in dialogue with others, but enriches it and embeds it into the ability to produce and exchange symbolic goods in the complex global context" (2006, p. 251). Symbolic competence is born out of an ecological view of language learning and encompasses linguistic forms, communicative choices, embodied experiences, emotional responses, and historical and moral dimensions. She has used this analytical construct to analyze language learning in institutional contexts (Kramsch, 2008a) and in multilingual settings (Kramsch, 2009b; Kramsch & Whiteside, 2007, 2008), and most recently at the individual level in her book *The Multilingual Subject* (2009c). This book explores the subjective aspects of language acquisition by analyzing data from published language testimonies and memoirs; from language learners' journals, interviews, and surveys; and from online data from learners in multilingual communicative contexts. It was awarded an MLA Kenneth Mildenberger Prize for 2009 and promises to gain momentum as an anchor text that provides the field with a theoretical and empirical frame for understanding language education in an increasingly connected, multimodal, and plurilingual world.

The import of Kramsch's scholarly work is reflected not only in her written work, but also in her service to the field. Across the last 20 years, she has averaged eight keynote speeches, plenary addresses, or workshops each year at universities in Asia, Australia, Europe, North America, and Southeast Asia. In these talks, she offers thought-provoking theoretical and pedagogical insights into the intertwined relationships of culture and language as well as critical analyses on topics as diverse as multilingualism, intercultural theory, literacy and technology, metaphoric imagination, language ecology, identity formation, and discourse and gender analysis. She has been acknowledged through awards from

many professional organizations and through invitations to serve on editorial boards and in leadership positions. Awards include the aforementioned MLA Kenneth Mildener Prize in 1993 and 2009, the Distinguished Service Award from the Modern Language Association in 2000, and the Distinguished Scholarship and Service Award from the American Association for Applied Linguistics (AAAL) in 2008. The Goethe Institute has thrice honored her work, first with a Certificate of Merit in 1986, later with a series of grants to conduct trilingual/tricultural teacher training seminars in 1994, and most recently, with a prestigious Goethe Medal in 1998 for promoting intercultural understanding between Germany and the United States. She has received two honorary doctorates, one from the Middlebury School of Languages in 1998, and another from St. Michael's College in 2001. She has served on editorial boards of 14 prominent refereed journals; she served as coeditor of *Applied Linguistics* from 1999 to 2004; and she is currently the editor and founder of the new *L2 Journal*. She was the president of AAAL in 1994 and has served on numerous other commissions, councils, and advisory groups.

In all of her work, Kramersch has insisted on making connections to language teaching, and her own craft as a teacher—whether in the classroom or as a workshop leader or discussant—has inspired generations of students, scholars, and colleagues. She is an ardent supporter of idea exchange and has organized countless courses, colloquiums, and other venues for sharing and critique. She has helped organize international conferences on language ecology, plurilingualism, and intercultural learning. She has also brought politically difficult topics into conference discussion spaces, including a colloquium at AAAL that addressed the controversial involvement of the US Department of Homeland Security with federal language funding. In 1994, she founded the Berkeley Language Center, which has blossomed into a center for workshops and colloquiums as well as a virtual space for exchanging ideas and resources for language education. Also at Berkeley, she has developed several cutting-edge courses, such as a language ecology course that brought in interdisciplinary lectures and a Language and Power course which has, as one former student writes, “legendary status with waiting lists to get in” (A. Whiteside, personal communication, 2010). When awarded the prestigious UC Berkeley Distinguished Teaching Award in 2000, she commented that for every class, she tries “to spark students’ interests while challenging their intellect . . . to create a context in which together we can experience new ways of seeing things that, at first sight, might look familiar” (<http://teaching.berkeley.edu/dta00/kramersch.html>).

It is appropriate for a discussion of Kramersch's contributions to the field to conclude with an acknowledgment of her rhetorical style. Her writing carries a recognizable stamp of rigor, freshness, and elegance, as it provides insightful juxtapositions of thought and unique analytical lenses. The examples she uses are drawn from a wide range of arenas, including literary texts, sociological studies, philosophical treatises, and interactional data. In her recent book *The Multilingual Subject*, she provides a typically poignant turn of phrase to describe the import of foreign language study for many students: “Yet below the radar of tasks and exercises, the students discover in and through the foreign language subjectivities that will shape their lives in unpredictable ways” (2009c, p. 3). In a similar vein, below the radar of this brief account of Kramersch's work—the lists of publications and the short synopses of her complex work—students and colleagues discover in her work subject positions and ideas that have shaped our professional lives and our field in unpredictable, and invaluable, ways.

Krashen, Stephen

KATY ARNETT

Stephen Krashen was born in Chicago, Illinois, in 1941. He earned a PhD in linguistics from the University of California, Los Angeles, and is currently professor emeritus of education at the University of Southern California's Rossier School of Education. He spent most of his career at this institution, arriving in 1975 following a two-year turn at Queens College in New York. Krashen retired from teaching in 2002, but remains an active and vocal scholar. To date, his publication record stands at nearly 500 books, articles, chapters, and monographs, along with countless conference presentations, plenary sessions, and keynote addresses.

The initial phase of Krashen's career focused on framing understanding about how second languages (L2) are acquired. Krashen had been an active scholar since the 1970s, but it was his work in the 1980s that firmly established him as an early leader in the field of second language education. In 1981, Krashen published *Second Language Acquisition and Second Language Learning*, which used his previous work with adult learners of second languages to explore, in greater detail, his monitor theory. Monitor theory maintains that adult learners of a second language have two ways through which to develop their proficiency in the target language: acquisition, which exists at a subconscious level, and learning, which exists at a conscious level. Of the two, acquisition is viewed as most critical to the mastery of the L2, as it enables the individual to use the L2 knowledge he/she has unconsciously gathered through natural exposure to meaningful language. Learning, on the other hand, serves the more modest role of supporting the conscious recruitment of monitoring processes to help regulate and repair the quality of the L2 that has been produced, a product of the acquisition system. The following year, he published *Principles and Practices in Second Language Acquisition*, which is often regarded as his seminal text on second language acquisition and clearly outlined his influential nativist perspective on L2 development. The text introduced the "monitor model," consisting of five formal hypotheses that were designed to offer a comprehensible explanation of the development of second language proficiency. These hypotheses include: (a) the acquisition-learning hypothesis; (b) the monitor hypothesis; (c) the natural order hypothesis; (d) the input hypothesis; and (e) the affective filter hypothesis. In 1983, Krashen collaborated with Tracy Terrell to publish *The Natural Approach*, which endeavored to help practitioners translate the various aspects of his theories on second language acquisition to classroom practice.

Krashen's initial hypotheses, based on evidence from differing domains of research, have been noted for their intuitive appeal to classroom practitioners, particularly in relation to the affective filter hypothesis (Lightbown & Spada, 2002, p. 40). The ideas introduced in these three texts permeated his work for the next decade, as they fueled vigorous theoretical development within the field by inciting systematic debate about the distinction between learning and acquisition, the role of input in shaping language knowledge, and the emotional needs of the learner in the classroom (e.g., Krashen, 1985, 1999). These issues have been recast into contemporary constructs that continue to be debated and researched, such as the interface between explicit and implicit knowledge, the distinct contributions of input, comprehension, and content-based learning to second language development, and the centrality of affect in language learning.

Krashen's interest in the development of literacy became a greater focus in the 1990s, largely as an outgrowth of his work with the input hypothesis, which has always been one of his central contributions to the field of second language acquisition and which he has since refined and relabeled as the comprehension hypothesis (2001). According to the comprehension hypothesis, language acquisition happens when we understand messages that have been conveyed to us, through speech or writing. Comprehension of written messages (reading) is the basis for our literacy development, that is, the ability to use sophisticated language structures, accurately spell, and apply appropriate style conventions in writing (Krashen, 2004). Krashen (2003, 2010) argues for the use of free voluntary reading experiences as a way to strengthen one's reading capacity and, more notably, as a way to possibly remedy two significant challenges in the experience of developing L2 proficiency: using the language in more authentic ways and gaining academic language competence. Recent large-scale, rigorous research into the benefit of extensive reading and reading for pleasure has provided confirming evidence for this position (e.g., Beglar, Hunt, & Kite, in press). This line of inquiry dominates much of Krashen's current work, which also includes the impact of poverty on access to reading opportunities, questioning the need for extensive instruction in phonics and phonemic awareness, the need to limit the number of standardized tests in school settings, summer reading programs, and stronger school and public libraries, among other themes. With this phase of his scholarship, Krashen's influence now extends beyond the field of second language education (e.g., Shin & Krashen, 2008).

The 1990s also saw the development of another aspect of Krashen's scholarship: the vocal support of and advocacy for bilingual education. In this decade, the political landscape in California led to considerable debate and contention about the educational programming needed to effectively meet the needs of the state's growing population of English-language learners (ELLs). The debate ultimately culminated in the passage of a ballot initiative known as Proposition 227, which led to the end of most traditional bilingual programs in that state, in favor of an intensive, one-year structured English immersion program (Crawford, 2008). Krashen's prior research in second language acquisition was consistently cited in the lead-up to the vote as proof of the positive impact of bilingual education, and he actively engaged in additional scholarship designed to question the logic and research being used by opponents of bilingual education to advance their argument and to challenge the replacement model of structured immersion and question its impact (e.g., Krashen, 1996, 1999). As part of this debate, as well, Krashen has also explored the status, maintenance, and impact of heritage languages for ELLs (e.g., Cho, Shin, & Krashen, 2004).

Krashen's five-decade career has left an indelible legacy in second language education, offering insights into key aspects of language acquisition and teaching, from theoretical understandings of how language is acquired, to methods for enacting theories, to the programming opportunities that can help or hinder student success, to the components of powerful reading experiences, among other inquiries. He has also provided a model for effective scholarly advocacy in applied linguistics.

Kress, Gunther

JEFF BEZEMER AND JAN BLOMMAERT

Gunther Kress (1940–) is a linguist, semiotician, and social theorist. Cofounder of critical linguistics, critical discourse analysis, and social semiotics he has worked across the humanities and social sciences, synthesizing ideas from Marx and Foucault with literary studies, transformational generative linguistics, systemic functional linguistics, sociolinguistics, cultural studies, media studies, and design studies. He has written extensively on power, ideology, discourse, genre, pedagogy, multimodality, representation, and communication, including more than 15 books. He earned a Doctor of Letters from the University of Newcastle, Australia, in 1988, and was made Doctor of the University by the University of Technology, Sydney in 1993 in recognition of his achievements. The impact of his ideas extends well beyond academia, in particular in literacy and education, advertising, and graphic design.

Kress's career path cuts across different continents. He studied English literature at the University of Newcastle, Australia (1962–1966). In the final year of this undergraduate program he focused on linguistics, engrossing himself in the work of Noam Chomsky. Upon completing his degree he moved to Europe, first to Germany, where he was a *Lektor* for a year, and then to England, where he worked as a research fellow and later as a lecturer in Applied Linguistics at the University of Kent (1967–71). From Kent he commuted up to London to do a postgraduate course in linguistics at University College London, where he was supervised by Michael Halliday. He then became a lecturer in linguistics at the University of East Anglia, Norwich, where he developed critical linguistics with Robert Hodge, Roger Fowler, and Tony Trew, coauthoring *Language and Control* (Fowler, Kress, Trew, & Hodge, 1979) and *Language as Ideology* (Kress & Hodge, 1979). As editor of *Halliday: System and Function* (1976) he also helped settle the naming of Halliday's linguistics, which until then was variously called either system structure theory or system function theory.

He moved back to Australia in 1978, inaugurating and heading up the School of Communication and Cultural Studies at the South Australian College of Advanced Education, Adelaide (1978–83) before moving to the Institute of Technology, Sydney, where he was dean of the Faculty of Humanities and Social Sciences. In 1987 he became professor of communication at the University of Technology, Sydney. During this time in Australia, Kress continues to teach and write about language and power (Kress, 1985, 1988), introducing critical linguistics (and critical discourse analysis, as it was now beginning to be called) to the emerging field of cultural and media studies. He also wrote *Learning to Write* (1982), in which he reflects on (his own) children's developing sense of writing, and embarks on two collaborative projects, a second project with Robert Hodge, who had already moved back to Australia in 1977, and a project with Theo van Leeuwen.

With Hodge Kress developed the premises and concepts from critical linguistics to explore other modes of representation, such as image, sculpture, photographs, paintings, and layout in magazines and on billboards. They named their approach after Michael Halliday's *Language as Social Semiotic* (1978), taking from him the idea that language is one of many semiotic resources available within a culture. Unlike Halliday, and unlike some others who took Halliday's ideas on power and control forward and continued to name their approach critical discourse analysis (such as Fairclough, 1989), Hodge and Kress

aimed to look across semiotic resources, and named their approach *Social Semiotics* (1988). With van Leeuwen Kress continued to develop a social semiotic approach to image, culminating in *Reading Images* (1990, published by Routledge in 1996). Socially and culturally organized sets of semiotic resources would later become known as “modes,” and “multimodality” became a key concept of social semiotics. Multimodality highlights that meaning is always made in different “modes”—speech, gesture, facial expression, writing, color, music, and so forth—which have different *affordances*. Modes allow only certain messages to be articulated, and their affordances are socially conditioned. This insight would be crucial for the later part of Kress’s career.

Kress moved back to England to become professor of English at the Institute of Education, University of London in 1991; and, in 2008, professor of Semiotics and Education. Now in an institutional environment which is focused on teaching and learning, he developed social semiotics along educational lines. Drawing on his encounters with Basil Bernstein, he weaved in notions of curriculum and pedagogy. He took part in the New London Group (1996), discussing the future of literacy and education in a global world and new media. In *Before Writing* (1997) and *Early Spelling* (2000) he continues to think about “learning” through making and engaging with text, seeing sign making as creative, transformative acts.

Back in England, Kress focused increasingly on “multimodality”—not only understood as an approach to the theory and analysis of “print text,” as mediated through books, magazines or screen, but of all forms of representation and communication, including “talk”—and of the relations between them. This understanding is articulated in *Multimodal Discourse* (2001), the product of a second round of collaboration with Theo van Leeuwen, who was based at the London College of Printing in the late 1990s. The book title features “discourse,” not “semiotics,” as the former had become more “speakable” (Hodge, 2009), making it the preferred title for publishers. Multimodality became the starting point for a number of research projects which Kress led in the 2000s. Funded by UK research councils, and working with Carey Jewitt and others he explored the multimodal production of science and English in classrooms, on screens, and in textbooks (Kress, Jewitt, Ogborn, & Tsatsarelis, 2001; Kress et al., 2005; Bezemer & Kress, 2008), focusing on social, cultural, and technological change and its relation to multimodal representation and communication (Kress, 2003).

Since Kress’s pioneering work multimodality has become a widespread approach to research, with a distinctive set of methods for collecting and analyzing data of all kinds, complementing, in particular, applied linguistics and ethnography (see Jewitt, 2009). That said, as this has been adopted across disciplines “multimodality” does not necessarily imply the premises and concepts of Kress’s or indeed others’ versions of social semiotics (such as the Scollons’s geo-semiotics). While manifold and under constant revision these premises and concepts may be summarized under three headings: sign making, multimodality, and change.

The notion of the *sign* is borrowed from traditional semiotics. Signs are elements in which the signified (“meaning”) and signifier (“form”) have been brought together. In Kress’s social semiotic take, the “sign” is always viewed in relation to its “making.” *Sign making* builds in part on the Hallidayan notion of choice, which proposes that sign makers choose from a range of resources, all of which have different meaning potential and social effects. But it also highlights that sign makers choose not just from preexisting, fixed resources, but instead actively make signs: “Signs are *made*—not used—by a sign-maker who brings meaning into an *apt* conjunction with a form, a selection/choice shaped by the sign maker’s *interest*.” (Kress, 2010, p. 62). Thus “sign making” foregrounds the agency and creativity of sign makers, while acknowledging that the resources that they draw upon are always limited and shaped by the social environment and circumstances of use.

Multimodality provides a radical alternative to the common “verbal–nonverbal” dichotomy, which positions the verbal as the unmarked, dominant resource for making meaning, and the nonverbal as the marked, auxiliary resource. Kress’s multimodal view holds that (a) communication is always and inevitably multimodal, and (b) that each of the modes available for representation in a culture provides specific potentials and limitations for communication, that is, affordances. The first assumption implies the need (for applied linguists, educationalists, etc.) to attend to all modes that are active in an instance of communication. The second assumption implies the need to attend to the specific meanings carried by the different modes in communicational ensembles. A *mode* is defined as a socially shaped cultural resource for making meaning. Image, writing, layout, speech, and moving image are examples of modes. Modes have differing modal resources. Writing for instance, has syntactic, grammatical, and lexical resources, graphic resources such as font type, size, and resources for “framing,” such as punctuation. Writing might make use of other resources, for instance, the resource of color. Speech and writing share aspects of grammar, syntax, and lexis. Beyond these, speech has intensity (loudness), pitch and pitch variation (intonation), tonal/vocal quality, length, and silence. Image has resources such as position of elements in a framed space, size, color, shape, icons of various kinds—lines, circles—as well as resources such as spatial relation; and in the case of moving images, the temporal succession of images, “movement.” Thus modes have different affordances, which shape representation.

The interrelation between *social, cultural, technological, and representational* change is another central premise in the work of Kress. In short, he aims to account for the practices, aesthetics, ethics, and epistemologies of text production in an era where vertical power structures are increasingly being replaced by horizontal, participatory structures (Kress, 2008). This project entails not only a reevaluation of pre-Internet notions of authorship such as “plagiarism” and “copying” in view of, for example, emerging discourses and genres on social networking sites, but also developing an understanding of the implications of representational changes in “old” yet still widely used media, with image being ever more widespread, for instance in information books and textbooks (Kress, 2005).

Looking at Kress’s career to date, the order in which the three key premises were just discussed can be seen to reflect a chronological order. The notion of the sign emerged from the recognition, in the early 1970s, of the centrality of power in society, which was lacking so prominently in the linguistics of Chomsky. A decade on, in the 1980s, social semiotics emerged from the recognition of the centrality of drawings and other images in meaning making, which culminated in the notion of multimodality. Another decade on, the focus on “change” emerged in the wake of the World Wide Web and the recognition of the centrality of the screen and its representational implications. In all three periods, Kress has been among the first to draw our attention to what soon became taken for granted. Taken together, the three premises are an immensely powerful social theory of meaning, with wide ranging ramifications for applied linguistics, the humanities, and social sciences, and beyond.

Kroll, Judith

ANA I. SCHWARTZ

Judith F. Kroll (1948–) is a distinguished professor of psychology, linguistics, and women's studies at the Pennsylvania State University. Throughout her career she has made significant contributions across the fields of cognitive psychology, psycholinguistics, and applied psycholinguistics—too numerous to capture here in full. For example, the revised hierarchical model (Kroll & Stewart, 1994) broke new ground for research on bilingualism by providing a framework for understanding the cognitive architecture of bilingual memory. The model provides an explicit account of how bilinguals connect words across their two languages to their underlying concepts. With this framework in place, researchers interested in issues of acquisition could test specific predictions regarding how these connections are edified through acquisition. Because of the model's broad applicability across theoretical and applied domains it has served as an impetus for interdisciplinary research across the cognitive sciences and linguistics. For both the applied linguist interested in issues of L2 acquisition and the cognitive scientist interested in L2 representation the model offers a clear illustration of the intricate nature of how a word is represented with how it is developed.

Dr. Kroll started her career by first earning her Bachelor's degree from New York University with a major in psychology and a minor in mathematics. She then went on to earn her master's (1972) and PhD (1977) in cognitive psychology at Brandeis University. During her graduate career she was also a research associate and affiliate with MIT where she collaborated with Dr. Mary Potter, her postdoctoral adviser, on several projects and publications.

Any description of Dr. Kroll and the theoretical impact of her work is incomplete without highlighting her passionate scientific inquiry and her dedication to building a vibrant research community; because this has provided the foundation for modern theoretical advancements in the study of bilingualism. Perhaps one of Dr. Kroll's most well known contributions is the "revised hierarchical model" authored by Kroll and Stewart in 1994. While many scientists and scholars are familiar with this model and applied its assumptions in their own work, far fewer will be familiar with the particular circumstances that led to its inception. The story of how the model came to be formulated perfectly exemplifies (a) the importance of bridging scientific theory with real-world observations; (b) recognizing a research opportunity, especially when it arises unexpectedly; and (c) remaining open to new directions of research and collaborations. In the early part of her career Dr. Kroll's work focused on the cognitive representations of objects and words and published a series of papers examining how words and their underlying concepts are represented and accessed from memory. These studies provided evidence that concepts are stored separately from their associated verbal codes (or labels), in contrast to the assumptions of the dual coding theory proposed by Paivio (e.g., Paivio & Lambert, 1981). In 1984, a seminal paper by Dr. Potter and others (Potter, So, Von Eckardt, & Feldman, 1984) examined the nature of the connections between concepts and labels for bilinguals, who necessarily have at least two labels for each concept. Findings from this study supported the "concept association hypothesis," which assumes that, even in a weaker second language, labels are directly linked to their underlying concepts. Shortly after its publication, Dr. Kroll was reviewing the paper in one of the courses she taught at Mount Holyoke College (where she was then

associate professor). A student in the class had just returned from a year abroad in Germany. She insisted that she could “never turn off the [English] language” and that her personal intuitions simply did not resonate with the concept association hypothesis. This led to the formulation of an honor’s thesis in which she and Dr. Kroll tested novice, English-German bilinguals (Dr. Kroll reckoned that they managed to test each and every German-speaking student on the Mount Holyoke campus at that time). In contrast to the Potter et al. (1984) study, the findings supported a word-association hypothesis, which assumes that in earlier stages of acquisition, L2 words are indirectly linked to their underlying concepts via the L1 translations.

A year after publishing these results in *Practical Aspects of Memory*, Dr. Kroll was on sabbatical in the Netherlands. Being a parent to ten-year-old twins and having recently earned tenure, it was the perfect time for her to focus exclusively on writing. However, not only was she in a community in which she was surrounded by highly proficient bilinguals, she had also recently met two new colleagues, Wido la Heij and Annette de Groot, whose programs of research also included cognitive aspects of bilingualism. Furthermore, a recent Mount Holyoke graduate who had worked with Dr. Kroll as an undergraduate, Erika Stewart, visited the Netherlands for a few weeks. At the time it would have been hard to predict that a week’s worth of intense data collection in Amsterdam would lead to an entirely new direction in Dr. Kroll’s career.

The initial purpose of the revised hierarchical model (RHM) was to provide an account for the translation asymmetry observed in L1-dominant bilinguals who acquired their L2 relatively late. The translation asymmetry refers to the fact that for unbalanced bilinguals, translation from L2 to L1 (aka backwards translation) is faster than translation from L1 to L2 (aka forwards translation). The RHM accounts for this asymmetry by reconciling the seemingly opposing hypotheses of concept mediation versus word mediation. The central assumption is that there is an asymmetry in the relative strength of the connections between L1 and L2 words with their underlying concepts. When bilinguals are more dominant in their L1 words from this language have stronger connections to their underlying concepts, thus activation of words in the L1 is more likely to engage semantics than activation of L2 words. Words in the L2, on the other hand, are more strongly connected to their translations in the L1 than their underlying concepts. As a consequence, translation from L2 to L1 is faster than the opposite direction because it does not require conceptual mediation.

It was initially assumed that the stronger connection between L1 words and concepts was operational irrespective of whether activation flowed from words to concepts (such as when translating) or from concepts to words (such as when naming a picture). However, more recent evidence from Dr. Kroll’s laboratory and others suggests that the key asymmetry exists in the lexicalization of concepts, which is when activation flows from concepts to the corresponding lexical items.

The RHM has since provided a springboard for advancement in the cognitive understanding of the bilingual mind. It has been cited over 600 times in publications from an impressively wide range of applied and basic disciplines (Google Scholar). This impact is at least partially due to the fact that it is a cognitive model whose underlying architecture is responsive to changes in language proficiency allowing it to be tested across a variety of bilingual participant populations. Furthermore, its assumptions remain relevant and convergent with more recent developments in cognitive modeling. For example, the RHM predates connectionist approaches to the modeling of cognitive processes, which emphasize competitive processes between representations. Yet, the RHM’s assumption of an asymmetry in the lexicalization of L1 and L2 words dynamics can be easily accommodated within connectionist competitive dynamics. When a bilingual person attempts to lexicalize concepts in the less dominant L2 there is strong competition from the readily activated L1 labels thus increasing the cognitive cost associated with suppression of this competition needed to produce the weaker L2 label.

Shortly after her sabbatical in the Netherlands a position opened up in the Department of Psychology at the Pennsylvania State University where she has since pursued the study of the cognitive nature of bilingualism. The interest in bilingualism grew exponentially in the 1990s and into the new millennium. The roster of scholars from abroad that came to visit Penn State grew and grew. Several new faculties with active research programs in language and bilingualism were hired within various departments in the College of Liberal Arts and the number of people joining Dr. Kroll's laboratory meetings continued to rise. To put it perhaps too simplistically, just a few years before the creation of the Center for Language Science at Penn State, membership of Dr. Kroll's laboratory was spilling out into the hallways; clearly the interest in the scientific exploration of language at Penn State had outgrown the physical confines of the laboratory walls.

Her more recent work examines more closely the competitive dynamics between a bilingual's two languages and the subsequent cognitive consequences of negotiating this competition. The emerging picture is that production in the L2 requires inhibition of the L1. Dr. Kroll and her colleagues have observed effects of this inhibition across a range of measures including behavioral data, ERP measures of the early stages of speech planning, and in the phonetic realization of words.

Judith Kroll continues her research within the newly formed interdisciplinary and internationally active Center for Language Science at Penn State. This vibrant center represents a collaborative network of researchers and scholars across a diversity of fields such as cognitive and developmental psychology, speech and communication disorders, linguistics, both applied and theoretical, as well as a diversity of institutions of higher learning across the United States and Europe. Dr. Kroll's collaborative approach to science and scholarship is the foundation upon which this center was built. It is striking how the simple act of gathering scholars from different disciplines in the same room can lead to an explosion of ideas, new questions, and directions in one's career. There is no better learning opportunity for beginning scholars than to observe renowned scientists from fields as diverse as linguistics and developmental psychology co-design a study addressing a shared issue of interest by merging their expertise and scientific approaches.

Throughout her career Judith Kroll has been active in promoting the advancement of women in science. Through her mentorship of students and junior colleagues in the United States of America and Europe, she has had a significant impact on the number of women with active and impactful careers in science. Through her efforts in establishing and maintaining organizations such as Women in Cognitive Science, she has given voice to the unique challenges faced by women and gave many the confidence to break silence in the face of inequity. Thanks to the confidence she reinforced in them, many of those female junior scholars now have the tools to pass on this mentorship to the latest generation of incoming female scientists. Thus, Dr. Kroll's impact on science encompasses advancement in theory as well as future scholars. This dual focus on scientific theory and community remains an example that her students, past, present, and future, hold to and refer to as they build their own research programs.

Kučera, Henry

CHARLES F. MEYER

Henry Kučera is recognized for doing some of the earliest work on computers and language in the late 1950s. He drew upon this expertise to collaborate with Nelson Francis to create the standard sample of present-day American English (or Brown Corpus, as it is commonly called), the first computer corpus ever produced. The Brown Corpus marked the first time that a systematically selected collection of written texts had been made available in a computer-readable format. The methodology that Kučera and Francis developed to create the Brown Corpus proved so influential that it ushered in the era of corpus linguistics and served as a model for many future corpora that were developed.

Henry Kučera was born in 1925 in what was at the time the country of Czechoslovakia. He lived in Czechoslovakia until 1948, when, because of his student activism at Charles University in Prague, he was forced to flee the country following the establishment of a communist government. After a brief stay in Frankfurt working for the IRO (International Refugee Organization), he emigrated to the United States in 1949. Shortly after arriving in the United States, Kučera pursued a doctoral degree in Slavic languages at Harvard University, receiving his PhD in 1952. He then taught at the University of Florida in Gainesville until 1955, when he joined the faculty at Brown University initially as a professor of Russian and German and later (until his retirement) as a professor of Linguistics and Slavic languages.

Kučera's interest in language computation began in 1959 while he was doing a cross-linguistic study of phonological structures (Mitchell, 1993). To aid in his analysis, he had a mathematics instructor teach him how to do computer programming in exchange for language lessons in Russian. As his skills in computing developed, Kučera began teaching in 1962 a course at Brown in computational linguistics. One of his "students," as Kučera (2002, p. 307) recalls, was Nelson Francis, who after joining the faculty that year had decided to take Kučera's course. At the suggestion of the noted American structuralist W. Freeman Twadell (who at the time was chair of Linguistics at Brown), Kučera and Francis decided to begin work on the Brown Corpus.

To plan the overall design of the corpus, Kučera and Francis held a conference at Brown University in 1963 that was attended by John B. Carroll, Philip B. Gove, Patricia O'Connor, and Randolph Quirk (Francis & Kučera, 1979). After considerable discussion, conference attendees decided that the corpus would be one million words in length, and contain 2,000 word excerpts taken from texts published in 1961 that represented the following genres of edited written American English (see the entry for Nelson Francis for more details on the methodological considerations that led to the size and composition of the Brown Corpus):

By modern standards, computer technology in the early 1960s was relatively primitive, making the creation of the Brown Corpus a technologically complex enterprise. Kučera (2002, p. 307) comments that computers of the era were huge machines with only 50KB of RAM—less internal memory than the modern-day mobile phone. Before data to be used in the Brown Corpus could be processed, it had to be keyed in on punch cards or paper tape, a process that took more than a year to complete.

The first version of the corpus was released in 1964 (five additional revised versions have been released since then). Because the earliest versions were encoded on magnetic tape, the corpus could only be accessed and analyzed after the tape had been read into a mainframe computer and punch cards created to examine some aspect of the corpus. For instance, in Meyer's (1983) analysis of punctuation usage in the Brown Corpus, punch cards were produced that enabled searches for the strings such as ; *and* or ; *but*. In order to retrieve all instances in the corpus of the coordinating conjunctions *and* and *but* had to be preceded by a semicolon. The output of these searches was used to generate statistical information on the types of punctuation used to separate coordinated items, and to provide examples to illustrate the various uses of punctuation.

In 1967, Kučera, Francis, and Carroll published a book, *Computational Analysis of Present Day American English*, that provided word frequency information based on the Brown Corpus. Although word frequency lists had been created previously, this was the first such list that was based on a carefully collected group of texts and that contained frequency information not just for the entire corpus but for the individual genres of the corpus. Generating a frequency list of one million lexical items was a computationally intensive endeavor that required "14 hours of continuous dedicated processing on a million-dollar computer with the aid of six tape drives" (Kučera, 2002, p. 307).

Because the word frequencies were based only on the orthographic forms of words in the corpus, it was not possible to distinguish, for instance, the frequency of *walk* as a noun from its frequency as a verb. To make such distinctions, a set of 77 lexical tags was created. A lexical tag is a part of speech label that is associated with a particular word. For instance, three tags were created to describe all of the forms associated with the verb *do*:

<i>Tag</i>	<i>Form</i>
DO	do
DOD	did
DOZ	does

Lexical tags such as these were then assigned computationally to each word in the Brown Corpus by a computer program designed at Brown University called "TAGGIT" (Greene & Rubin, 1971). To assign a given tag to a word, the TAGGIT program analyzed the corpus in various stages (described in detail in Francis, 1979). First, the program searched the entire corpus, attempting to find each word in the program's lexicon. If a given word was located, it was assigned whatever tags were associated with the word in the lexicon. However, if no match was found, then a second attempt was made to associate the ending of the word with a list of suffixes and word class tags associated with the endings. If a

match was still not found, the word was arbitrarily tagged as a singular or mass noun, a verb (base form), or an adjective. Previous analyses had determined that these were the most frequent word classes found in the corpus. At this stage of the analysis, 61% of the words had one tag, and 51% had suffixes associated with one tag. The remaining words were subjected to various types of disambiguation. Even though this process was done semi-automatically, 23% of the remaining tags had to be manually inspected to determine the most appropriate tag.

The tagged corpus served as the basis of a second book, *Frequency Analysis of English Usage: Lexicon and Grammar* (Francis & Kučera, 1982). Unlike the original frequency list, the list in this book was able to provide frequency information by part of speech. Thus, separate frequency counts were available for *walk* as a noun and as a verb. The tagged Brown Corpus was a groundbreaking achievement “not only because it was the first [tagged corpus] and laid down the methodological groundwork for word class tagging but because it provided an accurate tagged corpus which could be used as a reference by other tagging systems” (Hockey, 2000, pp. 94–5). For instance, the original CLAWS tagger (<http://uclrel.lancs.ac.uk/claws/>) was modeled after TAGGIT, and was used to tag the Lancaster/Oslo/Bergen (LOB) Corpus, a corpus of edited written British English modeled after the Brown Corpus. A later version (CLAWS4) was used to tag the British National Corpus (BNC), a 100-million-word corpus of spoken and written British English. Over time, taggers have become much more accurate, with some able to achieve an accuracy rate as high as 96% without any human intervention.

Following the creation of the Brown Corpus, Kučera continued work in both corpus and computational linguistics. He developed a three-million-word database that served as the basis of citations included in the *American Heritage Dictionary of the English Language*, the first edition of which was first published by Houghton Mifflin in 1969. In the early 1980s, Kučera did additional work for Houghton Mifflin, designing one of the earliest context-sensitive spell checkers. This spell checker was able to analyze the context in which homophones and homonyms such as *to*, *two*, or *too* occurred to determine which was the correct spelling (Webber, 2007). In 1992, a festschrift for Kučera was published, honoring the work that he had done in both Slavic studies and computational linguistics (Mackie, McAuley, & Simmons, 1992).

In 1995, both Kučera and Francis were honored at the 16th annual meeting of the International Computer Archive and Modern and Medieval English (ICAME) held in Toronto (see also the ICAME Web site at <http://icame.uib.no/>). A special session was convened at which various speakers described the important contributions that they had made to the development of the field of corpus linguistics. Speakers at the session noted the influence the Brown Corpus had had on subsequent corpora (a summary of the responses was published in the *ICAME Journal* in 1996). For instance, the Lancaster/Oslo/Bergen (LOB) Corpus replicated Brown but with written texts representing British rather than American English. The Freiburg–Brown Corpus of American English (FROWN) and the Freiburg–LOB Corpus of British English (FLOB) were similar to Brown and LOB but contained written texts published in the early 1990s, thus enabling historical comparisons. The International Corpus of English (ICE), which contains components representing the various national varieties of English (such as American, British, Irish, East African, and New Zealand English), has a similar design to Brown. Each regional team is creating a one million word corpus divided into 2,000 word excerpts. However, spoken as well as written English is included.

The work that Kučera has done over his career (much of it with Nelson Francis) has had a long-lasting effect. Not only was he instrumental in starting the field of corpus linguistics but he and Francis have greatly influenced the manner in which linguistic corpora have been designed and analyzed. All corpora created since Brown have benefited

from the methodological insights into corpus construction and analysis that Kučera and Francis pioneered.

Kumaravadivelu, B.

LYNN HASBANY

Nobody who enters Professor Kumaravadivelu's office can miss the huge, colorful world map that hangs on the wall behind his desk. It is not the Mercator map that most of us are familiar with since elementary school. This map, drawn by the German cartographer Arno Peters, projects a different view of the world. This view seeks to correct the Eurocentric bias by not making Europe the center of the world; instead the equator is placed at center view and the other areas are sized proportionately. "Start seeing the world differently," Kumaravadivelu never tires of telling his inquisitive visitors.

"Seeing the world differently" is what Kumaravadivelu is all about. His scholarly work in three areas of applied linguistics—the teaching of culture, language teaching methods, and language teacher education—all represent his desire and determination to think outside the box.

The teaching of culture has recently gained prominence owing to the ongoing processes of cultural globalization. Kumaravadivelu contends that the existing sociological concepts of assimilation, multiculturalism, and hybridity do not adequately address the political, religious, and cultural complexities that cultural globalization has brought about. Hence, he has proposed cultural realism as an alternative. Cultural realism seeks the development of global cultural consciousness that results not just in cultural literacy but also in cultural liberty. It requires a willingness and ability "to learn from other cultures, not just about them. Learning about other cultures may lead to cultural literacy; it is learning from other cultures that will lead to cultural liberty" (Kumaravadivelu, 2008, p. 237). In his book *Cultural Globalization and Language Education* (Kumaravadivelu, 2008), he has presented pedagogic principles and classroom strategies for raising global cultural consciousness in the language learner. Recognizing the significance of his contribution, the Modern Language Association has awarded its Kenneth Mildenberger Prize for Outstanding Research Publication to his book.

If Kumaravadivelu's work on the teaching of culture urges practitioners of applied linguistics to explore beyond the conventional concepts of culture, his idea of postmethod pedagogy asks them to go beyond the traditional concept of method. For a long time, the field of English-language teaching has been unsuccessfully engaged in finding the best method. Arguing that what is needed is not an alternative method but an alternative to method, Kumaravadivelu has proposed the concept of postmethod. In two of his widely acclaimed books—*Beyond Methods: Macrostrategies for Language Teaching* (Kumaravadivelu, 2003) and *Understanding Language Teaching: From Method to Postmethod* (Kumaravadivelu, 2006c)—he presents a macrostrategic framework designed to help both beginning and experienced teachers to develop a systematic, coherent, personal theory of practice.

Kumaravadivelu continues his quest for out-of-the-box solutions in the area of language teacher education as well. In a forthcoming book, *Language Teacher Education for a Global Society: A Modular Model* (Kumaravadivelu, in press), he points out that current approaches to language teacher education, focusing as they do on discrete subjects such as methods, second language acquisition, curriculum design, and testing, ignore the processes of economic, cultural, and educational globalization and their unfailing impact on language education. He sees an imperative need to design a comprehensive model that pulls together

various strands of thought in a meaningful way. Accordingly, he has designed a modular model that consists of five modules: Knowing, Analyzing, Recognizing, Doing, and Seeing. The model is aimed at fundamentally transforming language teacher education.

In addition to being a scholar and a teacher, Kumaravadivelu continuously aspires to be a public intellectual. He believes that intellectuals have an obligation to help the general public be well informed. This view is reflected in the op-ed pieces that he writes periodically for the *San Jose Mercury News*, a leading newspaper in the Bay Area of California where he lives. He writes them with the same critical insights that mark his professional writing. For instance, in "Americans should be able to watch al-Jazeera English TV" (Kumaravadivelu, 2006a), he asserts that the American people are "long on opinions and short on facts" and stresses that they should be able to watch the currently unavailable Al-Jazeera English-language television station to better understand the Islamic world. In another, "Generals lacked courage of conviction by not speaking up sooner" (Kumaravadivelu, 2006b), he criticizes retired American generals for speaking against the Iraq War after their retirement, not before. In yet another, "Our prejudices, our selves" (Kumaravadivelu, 1997), he chastises our tendency to blame others for their religious, cultural, and ethnic prejudices without realizing that we ourselves harbor them.

To understand what drives Kumaravadivelu to persistently propagate ideas that go against the grain, his friends and colleagues have looked for clues in his early life and education. Born in a small town in the state of Tamil Nadu in South India, he had a rather modest beginning. His father was a primary school teacher and did not have the economic means to send all five of his children to college. His brothers and sisters, all older than him, had to stop after high school and seek much-needed employment. However, his father was determined to send him to college. With his help and with the help of his working siblings, he managed to boldly go where nobody in his family had gone before—to college.

After earning a BA and an MA in English literature from the University of Madras, he started teaching English at the university. A turning point came when the British Council in India offered him a Fellowship to go to Lancaster University in England to pursue a second Masters degree, this time in Linguistics for Language Teaching. It was there that he was initiated into the field of applied linguistics by some of its prominent practitioners. His preparation in applied linguistics continued at the University of Michigan, USA, where he earned his PhD. He believes that his studies at the universities of Madras, Lancaster, and Michigan have helped him synthesize the best of three educational traditions, and have shaped his personal and professional philosophy that is unmistakably reflected in all his work as a scholar and a teacher.

Kumaravadivelu's further readings in poststructuralism, postmodernism, and post-colonialism have motivated him to see the language classroom not just in its linguistic complexities but also in all its historical, political, social, and cultural ones. Consequently, one hears in his writings, speeches, and classroom teaching an undaunted critical voice. In an interview to the university newspaper, his departmental colleague Peter Lowenberg said: "He's not afraid if something he says or writes is not accepted by the mainstream" (2008). In fact, he exhorts his students to develop a critical voice too. And, he does it with irritating persistence. He has been known to warn his students at the onset of a term that nobody's culture is safe from reproach in the class, as he encourages them to take a new view of what constitutes culture. As well as being a critical voice, he is also a thoughtful voice. What Professor John Murphy of Georgia State University wrote about him sums up a common sentiment: "Few writers are as capable as Kumaravadivelu of engendering in a reader the feeling that you are in the hands of a thoughtful, and always thought provoking, guide" (Murphy, 2007, p. 243).

Language Attrition

ELISABETH AHLSEN

What Is Language Attrition?

Language attrition can be defined as a reduction, weakening or loss of a first, second, third, or more language in an individual person or in a community. The focus of research in this area is on language attrition in individuals, even though the definition of the term also includes the attrition of a language within a community (i.e., language death, when languages with few speakers gradually disappear). From typological as well as, for example, psycholinguistic or sociolinguistic perspectives, interesting parallels can be found between attrition of a language in an individual and attrition of a language in the whole community. For theoretical and applied linguistics, both are of equal interest, but this entry focuses on attrition in the individual.

Some researchers define attrition in the individual more narrowly. According to Köpke and Schmid, attrition is “the non-pathological decrease in a language that had previously been acquired by an individual” (2004, p. 5). The community or research area of language attrition has its origin in the 1980 conference “Loss of Language Skills” (Lambert & Freed, 1982). By including the word “non-pathological” in the definition, cases of L1 loss in an L1 environment due to aphasia, dementia, and so on are excluded. Interestingly enough, cases of L1 loss by normal aging are not excluded by the inclusion of this term. They are, however, not usually studied within this area and will, therefore, also be excluded here.

Even the narrow definition, however, retains the problem of what should be classified as “attrition” of an acquired L1, L2, and so on. Given that the term “non-pathological” has excluded some attrition phenomena, with, for example, neurological causal factors, the following question arises: How should we regard “attrition”—should we regard it as “normal” or “abnormal” language deterioration? Where is it reasonable to draw the line between normal influence between languages in a bilingual or polyglot and a state or process that can be called attrition of one or more languages? This question has not been solved and it is perhaps reasonable not to try to draw a definite line, but to consider these phenomena as varying more gradually (see Schmid & Köpke, 2007).

Language attrition can occur for many reasons. A monolingual person can lose his or her first and only language, a bilingual person can lose one or both of his or her two languages, and a multilingual person can lose one or more of his or her languages. This can take place in an environment where one or more of these languages are used to varying degrees. The degree of attrition can vary and different parts or aspects of language can be affected.

There are many possible conditions where language loss can occur. According to a taxonomy suggested by van Els (1986), L1 can be lost in an L1 environment, in cases of aphasia and dementia. This can also be studied in normal aging. The L1 can also be lost in an L2 environment (minority communities, migrants). The L2 can be lost in an L1 environment (e.g., by students who do not use their L2) or in an L2 environment (e.g., by older migrants reverting to the L1 in their own minority group).

Research on Attrition

Research has mainly investigated attrition of L1 in an L2-dominated environment and attrition of L2 in an L1-dominated environment. The first case comprises studies of migrants and language minorities, while the second case concerns second language learners and their maintenance of a learned L2. Subjects are, for example, children or adults who have lived abroad for a period and then returned to their original country, or persons of different ages who have been subjected to different pedagogical methods or environments for foreign-language education. Such research focuses on aspects of language, such as, typically, lexicon, grammar, or phonology. Studies of semantics (other than lexical) and especially pragmatics are more rare.

Typical Findings

The most typical case of L1 attrition is when migrants are exposed to a new language, and learn the new language while they are less exposed to the L1 (Schmid & Köpke, 2007). One finding is that L1 attrition is seen first and most clearly in the lexicon (i.e., mainly for nouns, verbs, and adjectives) and considerably less in grammar and phonology, in cases of migration after puberty (Schmid, 2009). The semantic potentials of the L2 items seem to influence the knowledge of corresponding items in the L1, thus giving them a slightly changed meaning (Pavlenko, 2003). Diminished lexical access in picture naming and a less diverse lexicon in conversation have also been noted (e.g., Schmid, 2002; Montrul, 2008). Knowledge of morphogrammatical features and syntax are typically not very much affected. What can be seen is an increased variability in the use of features and rules affected by the contact between the two languages (see, e.g., Tsimpli, Sorace, Heycock, & Filiaci, 2004).

Age Effects

The L1 remains fairly stable, at least concerning grammar, for many years in persons who migrate after puberty. In contrast to this, persons who migrate before puberty can suffer considerable L1 attrition (Ammerlaan, 1996; Pelc, 2001; Schmid, 2002; Schmid & Köpke, 2007; Bylund, 2009). One example is of Korean adoptees (3–10 years old) in France who lost their L1 completely (Pallier, 2007). These findings support the idea of a pre-puberty critical period for language acquisition and of a need for L1 input during the full period.

Similarly, an L2 acquired to a native-like level by young children living abroad can be completely lost when they move back to being exposed only to their L1 (in contrast to adults, who learn more slowly and less, but more easily retain some of the L2 after their return; Hansen & Reetz-Kurashige, 1999).

In general, it is important to consider the age factor in all studies of attrition, since many of them concern fairly old individuals and the effects of aging also have to be taken into account. Such effects are often mixed with more “prototypical” language-attrition phenomena in bi- or multilinguals, although some differences have been described by Goral (2004). Other studies concern children who might not have “total mastery” of their L1 to begin with.

Regression

Based on early studies of attrition, Jakobson (1941) proposed a regression hypothesis suggesting that the aspects of language that were acquired last would be forgotten first. Although some evidence supports this hypothesis, it must also be recognized that many other factors are involved, such as contact phenomena between the languages, proficiency, age, literacy, linguistic features in common between L1 and L2, and possibly a threshold

effect of proficiency. As a result, clear evidence concerning this hypothesis is considered inconclusive (Yukawa, 1998; Keijzer, 2007).

Frequency of Use and Automaticity

It seems reasonable to assume that use (and, thus, rehearsal) would help to sustain a language (e.g., Paradis, 2007). No strong correlations between use and attrition of one language in a context where another language is mainly used have been found, however, according to Schmid and Köpke (2007). Results are so far not conclusive and more studies of this factor are needed.

Similarly, the hypothesis that the more automatic linguistic aspects or skills are, the more resistant they are to attrition requires additional research. However, difficulties affecting fast lexical retrieval of specific target words do figure among the first signs of attrition. This leads to more variability in word choice and more circumlocutions (Olshtain & Barzilay, 1991). Quick and accurate access of target words is replaced by word substitutions, slower speech, an increase in pauses and hesitations and also of repairs and false starts, in other words signs of an increased need for communication self-management (for a closer description of such phenomena, see Allwood, Nivre, & Ahlsén, 1990). In bi- and multilingual persons lexical borrowing and code switching are additional strategies.

Motivation

Another prediction by Paradis (2007) is that motivation should influence the degree of attrition. Positive or negative emotions toward a language, a culture, a situation, or an environment would increase or decrease the ability in that particular language in relation to a competing one. There are considerable methodological problems in trying to assess, for example, emotions at the time of migration. Schmid (2002) interviewed German Jews in a study that points to a strong case of rejection and thereby attrition of a language after migration. Motivation is also a determining factor of achievement of L2 in schools and of use of L2 outside the classroom (Gardner, Lalonde, Moorcroft, & Evers, 1987).

Proficiency

High proficiency among L2 learners, according to Gardner et al. (1987), leads to better retention of the L2, whereas it does not by itself lead to more use of the L2 outside the classroom—that only occurs in combination with high motivation (see above). However, a problem arising in the study of proficiency is the need to try to establish a baseline of language proficiency before the start of attrition in bi- or multilingual persons. This is a challenge because it requires the researcher to identify prospective study participants before their attrition occurs.

These are only some of the many areas that are being investigated to better understand the causes and contents of attrition. Other interesting areas include the intersection of attrition with the type of schooling that a language learner receives. A study comparing immersion schools with non-immersion schools by Murtagh (2003) pointed to language acquired through immersion being more resistant to language attrition. In all of these studies, however, methodological issues need continued attention in order to strengthen understanding of factors affecting attrition.

Methodological Concerns

The fact that language attrition is a long-term phenomenon means that it would ideally be studied longitudinally. However, language attrition has almost always been studied at

a point in time when attrition has or has not taken place, that is, long after acquisition of the language in question and long after the influence of the competing language or the lack of exposure to the affected language started. There is therefore often no firsthand data on proficiency, frequency of use, motivation, and so on with respect to the (two) languages at hand at the time when the process of attrition might have started, and it is not always easy to even identify that point in time. Further, it cannot be assumed that attrition has taken place at a certain linear pace over a number of years. As in all studies concerning longitudinal phenomena, many factors are likely to have affected individuals as well as groups, both the studied groups and potential control or reference persons or groups.

The spoken language of research subjects has not been well described. Spoken language corpora have been studied for a number of years, but only for a number of languages and focusing on certain phenomena. It is therefore hard to identify points of comparison between a speaker's two or more languages. Language tests and translation tests have not been very successful and are not considered to be very helpful by researchers in this area. Interviews and questionnaires only give information about what the subjects believe or want to say or write that they believe about their own language proficiency, use, attitudes, and so on. The results can be very different from what is revealed by, for example, a video recording of language use, since language use is not in all respects totally conscious or reflected upon in advance. The formulation of questions can also bias the answers. This applies even more to interviews and questionnaires concerning past events, past proficiency, attitudes, and so forth. Reliability and validity of measurement is, thus, not easy to establish in such studies, due to the lack of direct ways of studying the relation between different causal factors and resulting attrition phenomena.

Many studies are conducted to find causes of attrition phenomena. But there is often no direct way of determining the relation between potential causal factors and observed phenomena. Results are therefore often inconclusive with respect to hypotheses about causes, for example, of differences in language proficiency between groups where social and language typological factors cannot easily be separated in the conclusions (see Goral, 2004).

Even the most basic questions about the definition of attrition are addressed in different ways in the research. Different perspectives exist (depending on differences in adherence to theoretical frameworks) concerning how the "object of attrition" should be described. Definitions mention "loss of a first or second language," "loss of the ability to use the language," and "loss of underlying linguistic knowledge." There is also a fuzziness inherent in defining what "language attrition" is, as opposed to simple language change, lexical borrowing, code switching, and so on in a group or an individual.

Extending the Scope of Attrition Research

Few studies have extended the scope of language attrition studies, using the term "attrition" in a wider sense, although, as can be seen above, L1 attrition caused by normal aging is not really excluded by the more narrow definition of language attrition. Goral (2004) compared features of L1 attrition in normal aging with phenomena described in L1 or L2 attrition studies. One similarity between the two "conditions" was that the possible background factor of less exposure to and use of the language could apply in both cases, since an advanced age often relates to a reduced work and social life, as well as to fewer demands on various types of language use in general. The second background factor of interference from another language only applies to attrition in bi- or multilingual persons. Another similarity is seen in the features of language, where both groups show simplification, use of unmarked forms, generalizations, and word substitutions. Yet another area where both

groups have difficulties concerns comprehension of complex materials. It has, however, been claimed that in older persons it is not linguistic features that are affected, but rather memory and other aspects of cognitive processing (Caplan & Waters, 1999). Differences found between the two groups can also, at least partly, be an effect of differences in tasks and methods of study.

A reasonable way forward in this area, where theories and methods from related areas could be incorporated and perhaps offer new insights and approaches, would be to apply methods used for studying one form of "language decline" or attrition in a wide sense to other forms, in order to make comparisons possible. This would also make the studies more directly relevant for linguistic theory in general, as well as for a number of applications. One example of how this could be done, mentioned by Goral (2004), is that more detail about lexical retrieval in the L1, L2, and so on could be identified by using methods and examples from neurolinguistic studies of attrition in normal aging, aphasia, or dementia. Breakdown patterns could be identified which would possibly point to features that are generally more vulnerable as well as features that are only specifically affected by one of the conditions for specific reasons. Attrition, decline, or loss of language offers fascinating data, and it is a challenge for the future to further develop the approaches to be used in studying them.

It is rather striking that the area of research seems to exist mainly within these limitations. The number of multilingual persons in today's world is huge and there is, in principle, no reason to focus only on L1 and L2, when L3, L4, and so forth are just as important. Furthermore, the terminology of L1 and L2 implies a sequential order of acquisition of the two languages, whereas it is quite common for two languages to be acquired simultaneously. Apart from the choice to exclude the possible areas of language attrition through language extinction and pathological L1 attrition, there is, therefore, also a defocusing (and almost omission) of research on attrition in multilingual persons and persons who acquire more than one language at a time.

Ladefoged, Peter

PATRICIA A. KEATING

Peter Ladefoged (1925–2006) was one of the great phoneticians of the 20th century, a pioneer in instrumental phonetic fieldwork who was equally interested in theoretical linguistics, especially distinctive feature theory. During his career, Ladefoged produced 10 books and over 140 other publications.

Born in Sutton, Surrey, England, he attended the University of Cambridge from 1943 to 1944, when his education was interrupted by war service in the Royal Sussex Regiment. In 1947 he resumed his education at the University of Edinburgh, where he received an MA in 1951 and a PhD in 1959. He studied phonetics with David Abercrombie, who himself had studied with Daniel Jones and was thus connected to Henry Sweet. Ladefoged's dissertation was on *The Nature of Vowel Quality*, specifically on the cardinal vowels and their articulatory versus auditory basis (Ladefoged, 1962). At the same time, he began important research projects with David Broadbent, Walter Lawrence, M. Draper, and D. Witteridge, with his first publications appearing in 1956. His 1957 paper with David Broadbent, "Information Conveyed by Vowels," was particularly influential (Ladefoged & Broadbent, 1957).

In 1959–60 Ladefoged taught in Nigeria, and thus began his lifelong commitment to instrumental phonetic fieldwork. He returned to Africa in 1961–2 to do the work that resulted in *A Phonetic Study of West African Languages* (Ladefoged, 1964). In its introduction he wrote,

I do not know of any previous attempt to use data provided by palatograms, linguagrams, casts of the mouth, photographs of the lips and spectrograms all of the same utterance, supplemented by tracings of cine-radiology films and pressure and flow recordings of similar utterances of the same word. (Ladefoged, 1964, p. xvi)

With phonetic descriptions of 61 languages, this work remains unique. Ladefoged also was part of a Ford Foundation project in East Africa that resulted in the 1972 book *Language in Uganda*, which aimed to describe for the Ugandan government the current language situation in the country so that the government (not linguists) could arrive at a language policy, for example, regarding a national language and language teaching (Ladefoged, Glick, Cripser, Prator, & Walusimbi, 1972).

When not in Africa, Ladefoged taught at Edinburgh until he moved permanently to America in 1962, joining the UCLA English department. In 1966 he moved to the newly formed Linguistics department, where he established, and directed until 1991, the UCLA Phonetics Laboratory, which became the most prominent linguistic phonetics laboratory in the world. Not long after he arrived at UCLA, Ladefoged was asked to work as the phonetics consultant for the 1964 movie *My Fair Lady*. He advised on equipping Henry Higgins's phonetics lab, he made all the phonetic transcriptions seen on-screen, and it is his voice heard producing the vowel sounds.

During his career Ladefoged became a worldwide field linguist, visiting Nigeria, Botswana, Ghana, Uganda, Tanzania, Sierra Leone, Senegal, India, Yemen, Papua New Guinea, Nepal, Thailand, Brazil, Mexico, Australia, Korea, Scotland, the Aleutians, and China. Much of his fieldwork remains unique to this day. Fieldwork on little-studied

DOI: 10.1002/9781405198431.wbeal0594

sounds and instrumental laboratory phonetics were two cornerstones of Ladefoged's career. He loved laboratory phonetics, and instrumental analysis was always a key component of his fieldwork. Many data collection and analytic techniques in the field were originated or refined by him (and often tried out on himself). His instantly classic *Sounds of the World's Languages* (with Ian Maddieson) summarized his knowledge of all the sounds he had studied, and remains the definitive reference work (Ladefoged & Maddieson, 1996). His 2003 book *Phonetic Data Analysis: An Introduction to Phonetic Fieldwork and Instrumental Techniques* teaches other linguists his methods (Ladefoged, 2003).

Much of Ladefoged's fieldwork contributed to documenting the phonetic properties of endangered or otherwise under-studied languages, and he served on the board of directors of the Endangered Language Fund. His field recordings and notes have been digitized and are publicly available online (<http://archive.phonetics.ucla.edu/>). However, Ladefoged was not a champion of language preservation for its own sake. Controversially, he believed that linguists should not judge or try to influence speakers' decisions to give up a minority language in favor of greater education and opportunity for their children, or in favor of national unity over tribalism. "It is paternalistic of linguists to assume that they know what is best for the community" (Ladefoged, 1992, p. 810).

However, the ultimate aim of his studies of the world's sounds was to understand what sounds are possible in languages. His particular passion was the theory of phonetic features for representing phonological contrasts: What features should be proposed in order to distinguish all the contrasts of the world's languages? Should these features be articulatory or auditory or some of each? A related concern was the International Phonetic Alphabet: Ladefoged instigated its expansion in the early 1990s to include symbols for more sounds, he was a key figure in the preparation and publication of a new *Handbook of the IPA* (International Phonetic Association, 1999) describing the principles behind the alphabet, and he worked to ensure that computer fonts of the alphabet would be widely available.

Much of Ladefoged's early laboratory research on English was in the area of speech production, from electromyography of speech respiration to tongue positions of vowels to articulatory-acoustic modeling. While much of this research had potential clinical applications, Ladefoged's own original motivation was modeling speech production, first in hardware and later in software. In turn this led to an interest in applied phonetics for speech synthesis by computer and for speech technology more generally. Finally, over the years Ladefoged consulted on many cases of forensic speaker identification, especially cases involving "voiceprinting." He argued that it was generally not possible to be sure that two voice samples were from the same person.

Ladefoged was also a dedicated and successful teacher, winning the UCLA Alumni Association's Distinguished Teaching Award in 1972. His 20 PhD students included such influential figures as Vicki Fromkin, John Ohala, Ian Maddieson, Louis Goldstein, and Cathe Browman. His textbook *A Course in Phonetics* (now coauthored with Keith Johnson) is the standard in phonetics (Ladefoged, 1975). It draws on his extensive fieldwork experience and has shown generations of students the richness of linguistic sounds. Ladefoged developed computer-based teaching materials for this and other courses before this practice was common, materials now used online all over the world.

His many honors include the 1985 Festschrift edited by Vicki Fromkin, *Phonetic Linguistics: Essays in Honor of Peter Ladefoged for his 60th Birthday*; the UCLA College of Letters and Sciences Faculty Award in 1991; the Gold Medal at the XIIth International Congress of Phonetic Sciences in 1991; the Silver Medal in Speech Communication of the Acoustical Society of America in 1994; honorary doctorates from the University of Edinburgh in 1993 and from Queen Margaret University, Edinburgh in 2002; and the special session "Phonetic Linguistics: Honoring the contributions of Peter Ladefoged" at the October 2005 meeting of the Acoustical Society of America. He was president of the Linguistic Society of America

in 1978, of the Permanent Council for the Organization of International Congresses of Phonetic Sciences in 1983–91, and of the International Phonetic Association in 1987–91. (Also see Peter Ladefoged's Web page at www.linguistics.ucla.edu/people/ladefoged/)

Lado, Robert

SPIROS PAPAGEORGIOU

Born to Spanish immigrant parents, Robert Lado (1915–95) had a personal and a political interest in the teaching of English (Kramsch, 2007). He received his PhD in 1951 from the University of Michigan and served as the Director of the English Language Institute (ELI), which was founded by Charles Fries in 1941 to conduct research in teaching English as a foreign language and to test new scientifically based materials for the teaching of English (www.lsa.umich.edu/eli). The funding of the ELI was part of the US State Department's counteroffensive against fascist Germany, which was aiming to expand the teaching of German in Latin America (Kramsch, 2007). Because of President Roosevelt's postwar "Good Neighbor Policy" to promote pan-American cooperation, the mission of the ELI was to develop language and cultural programs for Latin American professional personnel and students. Fries and Lado, who succeeded Fries as the Director of the ELI, conducted contrastive analyses of English and Spanish linguistic systems. These analyses led to the development of the audio-lingual method of language teaching which formed the basis for the intensive English training courses in the ELI. Lado went to Georgetown University in 1960 and served on the faculty and as the Dean of School of Languages and Linguistics between 1961 and 1973. He contributed significantly to the expansion of the School, received honorary doctorate degrees and authored more than 100 articles and 60 books on languages and linguistics (Alatis, 1999). He helped establish English departments in five Spanish universities and founded the Lado International College (www.lado.edu).

In his book *Linguistics across Cultures: Applied Linguistics for Language Teachers* Lado (1957) maintained that a learner will find elements of a foreign language easy if they are similar to elements of the native language, and difficult if they are different. The aim of the book was to train teachers to make comparisons between L1 and L2 systems and help students overcome such difficulties. As Lado's work was associated with the behaviorist language learning theory of Contrastive Analysis (CA), which attributed language errors to L1 interference, his work was discredited, even though, thanks to Lado, researchers were drawn to the possibility of L1 influence on L2 learning. Swan (2007) argues convincingly that criticism of Lado's work was unfounded and that he clearly did not claim in his book that all language errors were due to L1 interference (for which CA was severely attacked). Nevertheless, sentences from the book have been quoted in isolation and criticized, whereas the many original ideas that Lado provided were ignored, as was his own clarification that learner problems based on contrastive analysis are hypothetical and should be checked against the learner's output (Ringbom, 1999). In fact, as Alatis (1999) points out, Lado's rich theory on CA was so important to the field of second language acquisition (SLA) that he has been referred to as the "indirect father" of SLA.

Lado's contribution to the field of language testing has long been valued and recognized. The recommendations in his book *Language Testing: The Construction and Use of Foreign Language Tests* (Lado, 1961) dominated, according to McNamara (2000, p. 89), the field's practice for two decades. Emphasizing the need for measurement theory behind testing techniques, Lado was attacked by the British communicative testing movement for advocating a discrete-point approach, where elements of language are decontextualized and tested in isolation. Such criticism has been characterized as "unjust" (Davies, 2008b, p. 329). In fact, as Fulcher (2000) points out, Lado was concerned about how reliably oral ability

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

DOI: 10.1002/9781405198431.wbeal0595

could be assessed and how valid inferences based on oral tests could be, given the limitations of sampling from the TLU (target language use) domain; however, he never suggested that oral skills should not be assessed at all, as some of his critics claimed. Moreover, Lado's emphasis on measurement theory combined with theories of structural linguistics for the construction of language tests was a major contribution to the field of language testing (Spolsky, 1995, p. 150).

Lado's 1961 volume, "the first book of its kind ever published" (Alatis, 1999, p. 771), was intended for teachers of foreign languages and was a first, serious attempt to present language testing in relation to theories of linguistics, language teaching, and learning, as well as measurement. Until that time, language testing was "a neglected area" (Green, 1965, p. 558), despite its obvious link to language teaching, and the literature "said little about the techniques and underlying principles of language testing" (Heiser, 1970, p. 43). The 27 chapters are grouped into five parts, whose titles would seem to fit a textbook on language testing even nowadays:

- general introduction and theory of foreign language testing;
- testing the elements of language;
- testing the integrated skills;
- beyond language;
- refining and using foreign language tests.

It has been acknowledged as a "pioneering book" (Spolsky, 1995, p. 352) and of tremendous breadth (Davies, 2008b, p. 330).

Lado's attempt to rely on theory was, according to Spolsky (1995, p. 150), a crucial step toward the professionalization of the field of language testing. His work, and that of his students and colleagues at the University of Michigan, resulted in some of the early tests in the field, on which TOEFL (Test of English as a Foreign Language) was modeled (Davies, 2008a, p. 4). The International Language Testing Association (ILTA) initiated in 1996 the Robert Lado Memorial Award, also known as the ILTA Best Graduate Student Paper Award, for the best paper presentation by a graduate student at the annual Language Testing Research Colloquium (LTRC). The award was established in recognition of Lado, "by all accounts the founder of modern language testing research and development, and an internationally renowned scholar" (www.iltaonline.com). The theme of the 33rd LTRC, "Half a Century of Language Testing: Back to Basics," hosted by the English Language Institute of the University of Michigan, reflects this recognition, 50 years after the publication of the 1961 volume. Despite the advances of the last five decades, Lado's work remains significant for language testing and other fields.

The author would like to thank colleagues at the University of Michigan for their useful comments on an earlier version of this entry.

Language Analysis for the Determination of Origin (LADO)

HELEN FRASER

Language analysis for the determination of origin (LADO) is a relatively new branch of applied linguistics. Generally considered a forensic application, it is used by governments to assess asylum seekers applying for refugee status.

The United Nations' 1951 Geneva Convention defines a refugee as a person with a well-founded fear of being persecuted in their home country for reasons of race, religion, nationality, membership of a particular social group, or political opinion. Asylum seekers who arrive in a country which signed the Geneva Convention, and are able to demonstrate such a well-founded fear, can claim the status of refugee, giving them rights of immigration to that country.

Since many asylum seekers, for a variety of reasons, arrive without reliable identity papers, the first task of immigration authorities is to determine whether applicants' claims are valid, or whether they may be misrepresenting their identity in order to gain entry to the country.

To aid in this determination, applicants are interviewed to test their knowledge of the language, culture, and region of the persecuted group they claim to belong to (European Union, 2008). In some cases, their speech is analyzed to determine whether it shows features of the specific language variety of the claimed group. This last procedure is LADO.

In principle, LADO is a reasonable endeavor. It is well known that people's lifelong speech patterns are shaped by their regional and social background, and language analysis is used to provide evidence of origin in other areas of forensic linguistics (e.g., French, Harrison, & Windsor Lewis, 2006). However, there are many cautions to consider when using this kind of evidence (McNamara, 2005). Like any forensic language analysis, it requires not just knowledge of the language in question, but expertise in relevant branches of linguistics (Rodman, 2002).

Though native speakers of any language commonly have a strong sense of confidence in identifying the regional or social origin of other speakers by their speech patterns, numerous studies have shown their ability is far less robust than their confidence warrants (see Fraser, 2009). This is true even for speakers of prototypical varieties of well-defined dialects of long-studied European languages, and the LADO situation is typically far less stable. Asylum seekers frequently come from communities featuring complex multilingualism or diglossia, and many have been displaced from their home region for long periods, often in mixed refugee camps, resulting in significant modification to their speech. Factors like these can make decisions about who counts as a "native speaker" of a particular language variety genuinely problematic.

All this means LADO requires high-level expertise not just in the linguistic and socio-linguistic patterns of the language, but also in methods for collecting and analyzing language data according to appropriate standards, and presenting conclusions objectively, with proper evaluation of their limitations (Eades, 2005).

The problem is that asylum seekers often come from regions which by their nature have provided few opportunities for scholarly study of relevant language varieties, and it can be difficult to find appropriate experts. It has become common for immigration departments

to use the services of agencies established to broker relationships between governments and analysts.

These agencies operate under pressure to process large numbers of asylum seekers from a wide variety of backgrounds, and, despite their extreme confidentiality, considerable evidence has shown that some hire underqualified “native speakers,” not always from appropriate language backgrounds, who provide over-confident judgments of origin on the basis of inadequate data (Eades, Fraser, Siegel, McNamara, & Baker, 2003; Reath, 2004; Singler, 2004).

A set of 12 guidelines, developed by an international group of linguists in 2003–4, and widely endorsed by the scholarly community, aims to help governments choose agencies which conduct LADO according to accepted academic procedures (Language and National Origin Group, 2004). Regrettably, however, the LADO industry is unregulated. While some agencies voluntarily respect the guidelines, there is no requirement to do so, and ongoing evidence shows some still employ underqualified analysts and questionable methods (Patrick, 2009).

Recently, members of one agency have sought recognition for a method whereby “native-speaker analysts,” lacking qualifications in linguistics, can nevertheless produce reliable LADO reports if trained and tested by a supervisor who does have linguistics expertise. This method conflicts with Guideline 3, which insists LADO should be carried out only by analysts with expertise in both linguistics and the language in question, but is argued to have the advantage of giving greater weight to native-speaker intuition than analyses conducted by academic experts who are not necessarily native speakers (Cambier-Langeveld, 2007, 2010).

Discussion of this method has raised some theoretical debate as to whether it is, in principle, possible for valid LADO judgments to be made by a team consisting of a native speaker lacking knowledge of linguistics and a linguist lacking knowledge of the language, or whether valid analysis requires expertise in both linguistics and the language in question embodied in one person (de Graaf & Verrips, 2009; Eades, 2009).

Other debates concern whether LADO is best treated as a language test or as forensic evidence, and, more generally, how to integrate methods and principles from phonetics, sociolinguistics, and other relevant disciplines.

There is clearly a need for a great deal more research on these and other issues. More pressing, however, is the practical task of ensuring that all LADO reports are produced according to standards appropriate to both linguistic science and the human rights and national security issues that are at stake. Collaboration between academic linguists, governments, and the more responsible LADO agencies is essential to achieving this aim.

Important steps in this direction have been made by several interdisciplinary workshops, including: “Linguistic Analyses Within the Asylum Procedure” (2008) by the Lingua unit of the Swiss Office for Migration (http://www.bfm.admin.ch/bfm/en/home/themen/migration_analysen/sprachanalysen/lingua.html); a 2010 European Science Foundation Exploratory Workshop, “Language and Origin” (<http://www.esf.org/activities/exploratory-workshops/humanities-sch/workshops-detail.html?ew=9418>); and, also in 2010, “Challenges and Commonalities in Providing Objective Evidence for Refugee Status Determination” by the independent research center CORI (<http://www.cori.org.uk/3.html>).

Establishment of an international Language and Asylum Research Group at the University of Essex should enable further significant developments in both research and practice.

Language and Globalization

MATTHEW J. HAMMILL AND EDUARDO H. DINIZ DE FIGUEIREDO

The term *globalization* is used in a wide range of contemporary discussions in academic contexts and as a result has been defined and applied according to the needs of diverse fields such as economics (Bhagwati, 2004), education (Suarez-Orozco & Qin-Hilliard, 2004), and cultural anthropology (Appadurai, 1996). Giddens (1990) defines globalization as “the intensification of worldwide social relations which link distant localities in such a way that local happenings are shaped by events occurring many miles away and vice versa” (p. 64). Based on this definition, language plays a crucial role in the process of globalization, in that it is a vehicle for connections and interactions between people and spaces, while at the same time is itself affected by global forces. Applied linguists have taken up these considerations in areas such as language spread, English as a global language, critical discourse analysis, and language education.

Mufwene (2010, p. 31) states that “neither economic globalization nor language spread is new in the history of mankind.” Commercial trade relations and military conquest led to increased language spread, as is clear from the expansion of Latin during Roman imperialism, and of Spanish, Portuguese, and English during European colonialism. Historically, less dominant languages have disappeared in the face of more powerful ones, as in the case of many indigenous languages, and globalization can be seen as increasing the pace of this phenomenon. Nettle and Romaine (2000) make the case that in the last 500 years worldwide language use has become increasingly homogenized, with smaller languages dying out, and more powerful ones consolidating their dominant positions (see also Skutnabb-Kangas, 2000). However, while the processes of globalization are not entirely new, their intensity and scope have increased with the development of mass media, popular culture, and multinational corporations, which has led to a contraction of the temporal and spatial scales of social and economic connections, thus consolidating political, economic, cultural, and linguistic power.

In particular, the spread of English and its increasing role as a global language have been the focus of much research. For example, the field of World Englishes has addressed how English has moved beyond its traditional linguistic bases in places such as the United Kingdom, the United States, and Australia (Inner Circle) to regions where it was nativized due to extended colonization, such as India and Nigeria (Outer Circle), and further to countries where it is used and taught as a foreign language, such as Japan and Brazil (Expanding Circle) (Kachru, 1992). Although English is not the only language of international communication, it is the primary language associated with globalization, not only because of its wide use as a *lingua franca*, but also due to its prevalence in international media, popular culture, scientific literature, and the institutional discourses of multinational corporations, economic blocks, and non-governmental organizations.

This status of English as *the* dominant language of globalization has been a subject of critical inquiry. Phillipson (1992), most notably, argues that the ascent of English has not been a neutral process, but rather one that has been deliberately developed and maintained at the expense of other languages, a phenomenon which he terms *linguistic imperialism*. For Phillipson, English has been legitimized by the ideological assumption that it brings modernization to social and cultural values, which in turn makes its increasing use seem

2 LANGUAGE AND GLOBALIZATION

natural and unavoidable. Although Phillipson's theory of linguistic imperialism has been influential on much work in applied linguistics, it has been criticized for being overly deterministic. Pennycook (2001) and Canagarajah (1999), for instance, have pointed out that Phillipson's view does not account for the agency, resistance, and appropriation that are involved in how people encounter and experience the global presence of English. These issues raised by Pennycook and Canagarajah are related to views that the relationship between globalization and language needs to be understood as complex, increasingly deterritorialized, and capable of change based on local conditions (see Blommaert, 2010).

Another issue that has received attention is that of the discourses of globalization themselves. Fairclough (2006) argues that these discourses do not only represent globalization, but also help construct what globalization actually is. In particular, Fairclough focuses on how the dominant discourses of globalization, conveyed through the media and politics, for instance, express neoliberal economic ideologies, such as the assumption that the development of global markets inevitably leads to economic empowerment and fosters democracy.

Finally, globalization has impacted language teaching and learning. One of the issues that has been problematized is the often assumed one-to-one correspondence between target language and target culture in light of the cultural issues that are posed by global flows (Kumaravadivelu, 2008). In the particular case of English, the question of which variety of the language should be taught has been addressed. It is often the case that standard varieties of American and British English are favored, mainly due to the prestige associated with them. Despite the acknowledgment that British and American English are valid models for teaching, it has been emphasized that they should not be uncritically adopted, and that pedagogical choices should be made based on a full understanding of local needs (Matsuda, 2006). One last issue that can be emphasized is the education of language minorities. In particular, immigrant flows in the age of globalization have demanded that schools reassess the ways in which they conceptualize language, culture, and teaching in order to accommodate the needs of diverse students. As with all the issues presented here, the intensification of globalization will demand increased attention to the role of language in shaping the realities experienced by people in diverse contexts.

Language and Identity

JOHN EDWARDS

"Identity" refers to the way we conceive ourselves as individuals or as members of groups—or, indeed, the way others perceive and categorize us. Although "language" requires a more nuanced definition, for present purposes we can understand it to comprise two important facets: the communicative and the symbolic. The former refers to its familiar instrumental uses, while the latter has to do with its emblematic functions as an expression and encapsulation of culture. While the symbolic aspects of language arise from the more mundane instrumental ones, they can outlive "ordinary" language shift for some time: One may no longer know the original or ancestral language of one's group, while yet retaining a psychological attachment to a medium uniquely important for a shared history, poetry, and narrative. The essence, then, of the language-identity linkage may include instrumentality but it also goes well beyond that. People who have been willing throughout history to fight for the preservation and continuation of their linguistic and cultural traditions would hardly have done so had communicative efficiency been the pivotal issue. They are motivated more by what George Steiner (1992, p. 494) so felicitously referred to as the "natural semantics of remembrance."

At the same time, both history and formal scholarship tell us that the maintenance of identity, the perception of a continuing cultural thread that connects us to our forebears, rests more upon the preservation of group boundaries than it does upon any specific cultural content within them. Fredrik Barth (1969) is perhaps the most influential of contemporary scholars who have argued that the essential point here is the boundary between groups. Among other things, this hypothesis illuminates the phenomenon of group maintenance across generations, particularly in immigrant contexts where the cultural "stuff" of people's lives usually changes dramatically in the course of a few generations. Third- and fourth-generation immigrants in the USA, for example, are generally quite unlike their first-generation relatives, yet, to the extent to which they recognize links (and differences from other groups), the concept and utility of group boundary has significance. Of course, the cultural content within boundaries, while mutable, remains important. An examination of traits, practices, and customs that disappear or become less visible, compared with those that show more longevity, can elucidate the ways in which boundaries are maintained in the face of changing circumstances. Language provides a specific instance here: The decline of an original variety clearly represents a cultural change—the abandonment of that language as a regular communicative instrument, and the adoption of another. But, to the extent to which the ancestral medium remains as a valued symbolic feature of group life, it may still contribute to the maintenance of boundaries. A generation ago, Carol Eastman (1984) discussed the notion of what she termed an "associated" language, one that group members no longer use, but that continues to be part of their heritage. This allows language to become a nationalist rallying-point, even for those group members who no longer speak it—or, indeed, who never did. We should bear in mind, too, that language-as-symbol is at least theoretically capable of regaining an instrumental and communicative status. Putting aside the case of Hebrew in Israel, there are many instances in many settings of nonspeakers setting themselves the task of learning an original variety, and this—even in instances where there is little realistic hope of actually *using* that variety on any sort of regular or

2 LANGUAGE AND IDENTITY

unselfconscious basis—is because of a strengthened or reawakened interest in culture and tradition.

The idea that the preservation of that original language is essential for the continuity of identity is of course central to the conceits of all language nationalists and revivalists. In 1797, Wilhelm von Humboldt wrote that “language is the spiritual exhalation of the nation” (Cowan, 1963, p. 118), and the sentiment remains powerful. Many scholars, too, have subscribed to the idea that, once language shift has occurred, the writing is on the wall for group identity. While language is clearly very important for a continuing sense of “groupness,” however—and while, indeed, the maintenance of an original variety may constitute the strongest single pillar here (religion is also a contender, of course)—this does not mean that identity cannot outlive language shift. Groups that have shifted, in communicative terms, from their ancestral variety to another often retain a distinctiveness at the level of accent or dialect, of course. Such “marking”—as in the case, say, of the English-speaking Irish, Welsh, or Scots, of Portuguese-speaking Brazilians, of Spanish-speaking Peruvians, or of German-speaking Austrians—can obviously contribute very substantially to the maintenance of group borders. It is probably fair to say that, in all instances in which two or more groups have come to “share” a common language, distinctions have arisen at the dialectal level. This also applies at regional levels: Irish English is not English English, but neither is it some undivided entity; speakers from Cork, Galway, Dublin, and Donegal are identifiably different. The fact that these distinctions remain marked, in a world made ever smaller by ubiquitous media and by the strong homogenizing pressures of “Westernization,” is surely further testimony to the powerful symbolic significance that linguistic markers at all levels can possess for identity.

The language–identity relationship is of particular importance in certain individual and group contexts. Remaining at the level of nationalism, first of all, the need that most languages have felt for standardization has resulted in the creation of official academies or other such institutions, whose duties have included the production of dictionaries and grammars. Their prescriptivist work, however, has very often led to efforts to keep languages “pure,” to keep out foreign borrowings—efforts that have gone beyond (or even countered) best instrumental practice, in the name of group-identity protection. Translation is an area in which language and identity concerns have sometimes collided: The person whose abilities allow the straddling of language-group borders may also take sensitive or private matters across those lines. The old Italian proverb that equates translation with treason (*traduttori, traditori*) is blunter. This is of course a variety of what has come to be called “voice appropriation,” the alleged cultural theft that occurs when outsiders—in what is often seen as neocolonialism—tell the stories that belong to the group—often to a particular caste within it—and which typically have spiritual significance. Other important settings involve religious language, gendered language, and other intertwinings that further underscore the centrality of language to the formation and maintenance of identity; see also Edwards (2009).

Language and Identity in Africa

SINFREE MAKONI AND BUSI MAKONI

Introduction

A central theme in discussions about language and identity is homogeneity and dissimilarity based on categories such as language, ethnicity, nationalism, and, to some extent, religion, all of which are highly contestable in their own right. For example, one of the most complex and contested relationships in most polities is that between language and national identity. Language is one potential marker of identity, as it provides individuals with resources to express their identity. Identity, on the other hand, is a “reflection of common history or language” (Calhoun, 1993, p. 211). In fact Cobarrubias (1983, p. 43), referring to the status of different languages, distinguishes between three types of states with reference to language: endoglossic, exoglossic, and mixed. In endoglossic states one of the official languages is an “indigenous” language. Kenya is an example of an exoglossic state in which English, a former colonial language, holds official status; Cameroon, unlike Kenya, has two excolonial languages as official languages (English and French). South Africa is an example of a mixed state because both indigenous and excolonial languages have been granted official status.

Language and National Identity

The relationship between language and national identity can be a site of struggle and contestation. Sudan, for example, has been embroiled in a long drawn-out conflict which, to some extent, is a consequence of a struggle over defining the linguistic makeup of Sudan. The conflict in Sudan can be traced back in part to the period of joint rule by the British and the Egyptians. During the condominium period (ca. 1890 to 1957), Sudan was divided into two: the north and the south (Miller, 2003). The identity of the north was founded on Arabic and its association with Islam, while that of the south rested on a triumvirate (English, African languages, and Christianity). After 1957, when Sudan became independent, the Khartoum government sought to transform the country into an Arabic nation through an Arabization strategy which imposed Arabic as a national language and Islam as the official religion. This was an attempt to create a unified Arabic national identity despite the fact that only 38% of the Sudanese population spoke Arabic.

Consequently, Arabization was challenged by southerners. Efforts to impose a monolithic nation accentuated the identities of the south instead of submerging them into an Arabic identity as the Khartoum government had intended. Even though south and north Sudan have officially become separate countries, it is still too early for the deep-seated identity problems which have evolved over decades to be resolved. The relationship between language and national identity is therefore constantly evolving and negotiated at different levels.

Identity

The concept of identity is currently used extensively in scholarly discourses, both in African studies and in applied linguistics. Because of the weight of the identity regime it is important to outline some of the characteristics of identity relevant to our analysis and understanding, especially taking into consideration African contexts. In line with Brubacker (2004) and to some degree Stoler (2002), two types of identity tropes are distinguished: "strong identity" and "weak identity." "Strong identity" refers to a consistency in the nature of social and behavioral practices including language performance. The consistency is reflected over historical and geographical spaces. "Weak identity," by contrast, consists in a flexible, fluid, and adaptable usage of identity. Strong identity is essentialist whereas weak identity is founded on "soft" social constructivism in which individuals choose an identity by exercising individual agency. This means an individual is not trapped by their individuality. The capacity and latitude of individuals to express and shape their identity is restricted by the fact that agency and the choices they make are constrained by a combination of linguistic, historical, and social factors. Paradoxically, if identity were completely free, the social and linguistic practices would be uninterrupted; after all, as Brubacker cautions, choice is meaningful only if it is restricted: "If identity is everywhere it is nowhere" (2004, p. 29).

History of Identity

Identity found its way into scholarly discourses through multiple pathways. Identity was popularized by Erikson (1968), who is credited with coining the term "identity crises." Identity also found its way into African studies and applied linguistics when it was separated from Freudian psychoanalytical work and later associated with Allport's (1954) writing on ethnicity. Other scholars working more or less independently in the 1960s invoked the term "identity" to provide an account of their work (e.g., Goffman, 1963; Berger, 1983). In addition, the rise of the Black Power movement as well as a sharpening of consciousness around the concepts of race, ethnicity, and gender increased the widespread use of the term and popularized the notion of identity crises. In African studies as well as in African applied linguistics, "identitarian" thinking has become one of the most prominent intellectual templates. It has been frequently invoked to resist the claim that ethnicity is primordial. In African studies, even when ethnicity is construed as "invented," the stress is on the formation of ethnicity and boundary formation, not on "boundary crossing" (Brubacker, 2004, p. 48). There is, however, an inconsistency in the constructivist treatment of identity. While ethnicity and other categories are said to be "invented," language is by default treated as "natural," thus downplaying the contexts and mechanisms which lead to its social formation (see Joseph, 2006, and Makoni, Brutt-Griffler, & Mashiri, 2007, for a constructivist position).

A Conceptual Shift From a Minority Language to an Indigenous Language

The relationship between language and national identity is complicated not only by the elusive nature of the notion of identity but also by the bidirectional nature of the relationship in question. Language is "imagined" in terms of a nation-state and national identity is imagined through language—a much more complex position than that advocated in "imagined communities" (Anderson, 1983). A further complication about the relationship between language and identity arises when a distinction is drawn between languages, especially when some languages are considered national/indigenous whereas others are

relegated to minority status, thus creating homogeneity and dissimilarity at the same time. For example, the Zimbabwean government has sought to promote minority languages as official national languages. Some minority groups such as the Tonga in northwestern Zimbabwe find the term “minority” objectionable and claim that it situates them at the margins of the political and economic spectrum. Because they feel that they are ideologically central to their own lives, they prefer to be classified as “indigenous” (Makoni, Makoni, & Nyika, 2008). From the perspective of the Tonga, the term “indigenous” creates opportunities for them to claim a legitimate status within Zimbabwe. However, the term is also problematic because it reifies language and identity instead of constructing these as practices, situationally contingent and shaped by ecological discourses (Fabian, 1986; Nettle & Romaine, 2000; Hornberger, 2003). Reification is inevitable, however; it is therefore the degree of reification which is being questioned, as extreme abstraction treats language and ethnicities as natural and stable depositories and not as discourses in context and constantly evolving cultures.

A determination of national identity is an ongoing struggle because of the conflict over who is included in/excluded from the state. For example, some youth feel excluded because of their use of urban amalgams and polylingualism; they cannot imagine themselves on the basis of official languages, and are ambivalent toward their national identity because they feel they are simultaneously part of the ‘hood’ and part of international social movements (glocal; Higgins, 2009). The global affiliation of some youth is apparent in the extensive usage of polylingualism in popular cultures (Higgins, 2009; Pennycook, 2010). Polylingual speakers are able to cross ethnic and linguistic boundaries (Rampton, 2005) and appropriate new identities, and they are not restricted to a single national identity.

Language and Identity in Precolonial Africa

Colonialism and postcolonial Africa have been used as starting points for all writing on language and identity in Africa. Yet language and identity can be inferred from material artifacts collected in excavations—such as spears, arrows, glass beads, ivory—and from commercial exchanges which are found in archives. It is plausible that material cultures and trade produced a specialized register for use by people from different corporations, ethnicities, and so forth, to facilitate their trade. As such, there must have been professions whose identity was shaped by their expertise in the construction of artifacts such as weapons and by the use of such weapons for both sanctioned and unsanctioned violence. The different types of weapons and variations within each weapon (e.g., in terms of size) suggest that a specialist vocabulary was developed in parallel with the technical specialization even in precolonial Africa. Similarly, the widespread presence of court jesters in kingdoms who could be described as female even when biologically male, and kings who could be described as male even when they were female, implies that in such contexts professional identity superseded gender as shaping language and identity. Gender, although an important aspect of identity, shows the complicated nature of social categories of Western scholarship. Ndaou chiefs (Zimbabwe) had assistants who were referred to as wives even though they were men, thus producing identity categories of men/women. The categories of men/women, wife/husband, and male/female have also been reported in other groups, such as the Shona and Yoruba populations in West Africa (Yankah, 1998; MacGonagle, 2001).

Inventing Ethnicity

Different approaches have been used in the analysis of ethnicity (Sollors, 1989) in African scholarship. One of the most well-known approaches to the development of ethnic consciousness has been attributed to “invention,” which highlights the general constructedness

4 LANGUAGE AND IDENTITY IN AFRICA

of ethnicities resulting from colonialism, as European colonial rulers attempted to impose administrative and political order on their colonies. Brass (1991, p. 8) states that ethnicities

are creations of elites, who draw upon, distort and sometimes fabricate materials from the cultures of the groups they wish to represent in order to protect their well-being or existence or to gain political and economic advantage for their groups as well as for themselves.

An example of this is the distinction between the Dinka and the Nuer in Sudan. In precolonial Africa the Dinka and the Nuer were not distinct ethnic groups. They both belonged to the Golo ethnic group (Tucker & Myers, 1910), hence the claim that the "Nuer were never Nuer, or Dinka were never Dinka" (Southall, 1976, p. 487). The Dinka story provides an example of invented ethnicities where they did not exist before. It also reflects "the paradoxical sense that ethnicity is something reinvented and reinterpreted in each generation" (Fischer, 1986, p. 218).

The Dinka/Nuer experience lays bare the strategies used in the construction of ethnicities in some parts of Africa. The invention of ethnicities where none existed before colonialism has been repeated in other parts of Africa, for instance the Manyika in Zimbabwe (Ranger, 1989), the Igbo in Nigeria (Wolpe, 1974), and the Ngala of the Congo. In essence, the colonial regime reinscribed a new social and linguistic order, which has manifested itself in contemporary society through ethnic wars or conflict, as most scholars working on Africa have remarked. Colonial differences were accentuated when the colonial rulers chose some ethnicities, which became pillars of their administration. The construction of ethnicity is not limited to colonialism. Its genesis is situated in precolonial Africa as well. The cases of the Acholi in Uganda and Ndaou on the borders of Mozambique are excellent examples of a form of ethnic consciousness. Acholi ethnic identity has its sociogenesis in the late 17th century (Atkinson, 1994); it is socially constructed and a product of history and imagination. The development of Acholi ethnicity was further expedited by the presence of Arabic-speaking traders who introduced the term "Shooli," which eventually became "Acholi." The Acholi consciousness and some Acholi ethnic practices were subsequently influenced to some degree by British colonialism, but their origins cannot be traced back exclusively to the British colonial encounter. Even if colonialism played a substantial part in enhancing the ethnic consciousness, ethnic identity is always emerging and does not have an end state. The Acholi are an "unfinished process of coming to be" (Lonsdale in Atkinson, 1989, p. 20).

The Ndaou are an important example of an identity whose origins and practices are found in Portuguese archives (MacGonagle, 2007). Ndaou ethnicity was only one aspect of that identity. The full range of their identity was reinforced by a wide range of factors including bodily marking (i.e., scarification), a practice which has continued to contemporary times. Some of the social practices which came to define Ndaou identity are, however, not unique to the Ndaou. For example, monotheistic religious practices and demonstrations of social respect evidenced by clapping of hands are shared with other ethnicities. Ndaou ethnicity has also been complicated by intermarriages between the Ndaou and Swahili-speaking traders and White travelers. The offspring of these relationships have been incorporated into Ndaou ethnicity and the ethnic background of these offspring has therefore become an important feature of ethnicity.

Ethnicity and Nationalism

There is a very thin line between ethnicity and nationalism. For example, Zulu nationalism may be attributed to the emergence and crystallization of Zulu ethnic consciousness. From

this perspective Zulu nationalism and ethnic awareness are different sides of the same coin. Zulu nationalism and ethnicity, like that of the Acholi, clearly predated colonialism but their nature and trajectory were to be shaped and influenced by colonialism.

Ethnicity as Work in Progress

How people categorize themselves seems to differ substantially depending upon where they are situated geographically. For example, the Tumbuka, Cewa, and other ethnic groups in Malawi strongly feel that they belong to different ethnicities in Malawi but accept a common ethnic label when in Zimbabwe. A similar tendency has also been observed among northerners in Ghana who define themselves as Hausa in Accra but not in northern Ghana. Upon returning to the north they do not necessarily realign themselves to their previous ethnicities. The cases of the Hausa, Tumbuka, and Cewa demonstrate that it might be more cogent to think of the relationship between ethnicity and multilingualism as strategic and expedient rather than as fixed, and thus to capture the fluidity of the language and ethnicity relationship which is lost from a monolingual/monoethnicity perspective.

The relationship between language and ethnicity is further complicated because social life is not organized along the lines of ethnicity. Social life may be organized according to professional associations, burial associations, clans, and so on—some of which intersect, while others run in parallel, thus the same individual may belong to multiple associations at the same time or shift from one association to another at different times during their life trajectory. The heterogeneity of language and the complexity of the relationship between language and identity are partially a consequence of an individual's multiple affiliations, and the tendency within each association to develop its own unique vernaculars.

Conclusion

In language and identity, as in other social science categories such as class, gender, national identity, and so on, we have to be skeptical of a tendency which assumes that the notions are unproblematic and fixed, in terms of both time and space. In addition, notions are deterministic in the sense that each category shapes the nature of language practices. Furthermore, notions such as language and identity are constantly evolving in academe, rendering relationships between them harder to establish.

Language and the Digital Divide

MARK WARSCHAUER

The *digital divide* refers to inequality in access to or use of computers, the Internet, and other information and communication technologies. The term became prominent in the 1980s when US Vice President Al Gore and other members of the Clinton Administration used it in reference to technology and inequality in the United States. It later became used in other contexts, both within countries and across countries, where there were perceived gaps in computer and Internet access. Attention to the digital divide has focused on many demographic and socioeconomic factors, with gaps associated with language a prominent concern. This entry will first examine the digital divide within the United States, and then internationally, in both cases focusing on language issues.

The US Digital Divide

Early access to personal computers and the Internet in the USA was highly stratified by race, ethnicity, gender, socioeconomic status, educational background, and language. Since then, differences in access by gender have largely disappeared, with differences in other areas narrowing but still remaining considerable. In addition to differences in access that are affected by all of these factors, there are also substantial differences in how technology is used, and in the outcomes that are associated with technology access and use.

The most comprehensive account of access to the Internet in the USA is provided by the US Census Bureau, which, in addition to its once-a-decade population count conducts monthly in-person current population surveys of about 50,000 representative households; these monthly surveys occasionally address topics related to technology. Data from these surveys has been analyzed and released in a series of US governmental reports on Internet access published in 1995, 1998, 1999, 2000, 2002, 2004, and 2008. According to the 2008 report, differences in Internet access remain substantial in the USA, whether considered by income, education, or race (see Table 1).

Language is also a prominent factor shaping access to the Internet in the USA. According to the 2003 Current Population Survey data, only 13.1% of Mexican or Mexican-American families in the USA in which all adults spoke only Spanish had home Internet access at that time (compared to an access rate of 40.1% among Mexican or Mexican-American families in the USA in which one or more of the adults spoke English), leading Fairlie (2007) to conclude that the digital divide between White, English-speaking non-Hispanics and Spanish-speaking Hispanics in the USA was “on par with the Digital Divide between the United States and many developing countries” (p. 287).

Moving from the question of home Internet access to Internet use, the language gap is even bigger. A phone survey conducted in 2006 found that only 32% of Spanish-dominant Latinos in the USA went online from any location, compared to 76% of bilingual Latinos and 78% of English-dominant Latinos (Fox & Livingston, 2007).

Also important to consider are the conditions of access and use. Low-income Internet users are less likely than those with high incomes to have broadband access to the Internet (see Table 1), and those without broadband have been shown to use the Internet to access

2 LANGUAGE AND THE DIGITAL DIVIDE

Table 1 Percentage of US households with Internet access

	<i>Percentage of households with Internet access</i>			<i>Broadband as percentage of those with access</i>
	<i>Total with access</i>	<i>Broadband</i>	<i>Dial-up</i>	
Total households	61.7	50.8	10.7	82.3
Family income				
Under \$5,000	31.9	26.7	5.3	83.6
5,000–9,999	24.6	18.4	6.1	74.5
10,000–14,999	26.1	18.9	7.1	72.2
15,000–19,999	35.5	26.9	8.5	75.9
20,000–24,999	40.7	28.8	11.8	70.9
25,000–34,999	50.9	39.7	11.2	77.9
35,000–49,999	65.7	51.0	14.4	77.7
50,000–74,999	80.1	66.0	13.8	82.3
75,000–99,999	88.6	76.8	11.3	86.8
100,000–149,999	92.1	83.7	8.0	90.9
\$150,000+	95.5	90.3	5.0	94.6
Educational attainment of head of household				
Elementary	18.5	13.1	5.4	70.8
Some secondary	28.2	20.5	7.4	72.7
High school graduate	49.1	36.8	12.1	74.9
Some college	68.9	56.5	12.1	82.0
BA+	84.1	74.2	9.7	88.2
Race of head of household				
White	67.0	54.9	11.8	82.0
Black	44.9	36.4	8.4	80.9
Native American	41.5	29.8	11.2	71.9
Asian	75.5	69.1	6.1	91.5
Hispanic	43.4	35.2	8.0	81.1

information or create and produce content much less frequently than broadband users (Horrigan, 2008). In addition, due to large family sizes and fewer computers per household, the number of people who have to share computers is typically large in Latino families, with individual home computer access being much more common in White families (Warschauer & Matuchniak, 2010). All of these factors, combined with differential amount of support from family members and peers, leads to very different outcomes from access to home computers and the Internet for youth, with White and high socioeconomic status (SES) students benefiting academically from such access, but Hispanic, African American, and low-SES students getting little if any benefit (see discussion in Warschauer & Matuchniak, 2010).

The digital divide has been examined within other individual countries as well, such as Canada, China, India, and a number of European countries (for an overview, see Matuchniak and Warschauer, 2010), but these studies have rarely addressed disparities by language background.

Table 2 World Internet usage

<i>Region</i>	<i>Percentage of population using the Internet</i>	<i>Usage growth 2000–9</i>
Africa	8.7%	1,810%
Asia	20.1%	569%
Europe	53.0%	305%
Middle East	28.8%	1,675%
North America	76.2%	140%
Latin America/Caribbean	31.9%	935%
Oceania/Australia	60.8%	177%
World total	26.6%	399%

Source: www.internetworldstats.com (retrieved July 1, 2010)

The International Digital Divide

Examined from a global context, differences in access to and use of new technologies are much greater. As seen in Table 2, the portion of the population using the Internet ranges from 8.7% in Africa to 76.2% in North America. However, not surprisingly, the regions that have the lowest Internet access are also seen to be experiencing the fastest growth.

A substantial but gradually narrowing gap among countries is confirmed by the International Telecommunication Union (2009), which developed an index to measure and compare access to technology, use of technology, and skill in using technology by people in more than 150 countries. In each of the three areas (access, use, and skill), developing countries experienced more rapid growth than developed countries. At the same time, the faster rate of growth among developing countries was principally due to excellent performance among middle-income countries, such as China, with the poorest countries experiencing comparatively slow growth in Internet access, use, and skills.

Language issues have played a prominent role in the international digital divide in several ways. The Internet was first developed in the United States, and in its early days its content was overwhelmingly in English. One study found that 81% of the Web pages in the world in 1997 were in English (see Warschauer, 2003). The dearth of Web content was especially stark for languages spoken in underdeveloped regions of the world and written in non-Roman scripts. For example, a study conducted in 2001 found that there was only one Web page in Arabic for every 1,584 native speakers of the language, compared to one Web page in English for 1.5 native speakers (Carvin, cited in Warschauer, 2003).

A study by Warschauer, El Said, and Zohry (2002) of online communication in Egypt illustrated the complex relationship between language and technology as the Internet first spread. They found that, in Egypt, many early adopters of the Internet were from the country's elite, who disproportionately go to English-medium schools and who also often work for international corporations, where English is commonly used. Because of these reasons, as well as initial difficulties in using the Arabic script on computers, many early Web sites in Egypt were published in Arabic, and many early adopters of the Internet in Egypt used English in their e-mails and chats. At the same time, chatting in a Romanized version of Egyptian colloquial Arabic was also common among these early adopters, thus helping give rise to a written form of this principally oral dialect. Chatting in Romanized versions of diverse languages appears quite common elsewhere as well, as learners creatively adapt the Internet to express their own identity (see, e.g., Lam, 2005).

4 LANGUAGE AND THE DIGITAL DIVIDE

Table 3 Top ten Internet languages in 2010

<i>Languages</i>	<i>Internet users (millions)</i>	<i>Percentage of all Internet users</i>	<i>Percentage Internet use among speakers of the language</i>	<i>Percentage Internet language growth (2000–9)</i>	<i>World population for this language (2009 estimate, millions)</i>
English	499	27.7%	39.5%	252%	1,264
Chinese	408	22.6%	29.7%	1,162%	1,374
Spanish	140	7.8%	34.0%	669%	411
Japanese	96	5.3%	75.5%	104%	127
Portuguese	78	4.3%	31.4%	924%	247
German	72	4.0%	75.0%	161%	96
Arabic	60	3.3%	17.5%	2,298%	344
French	57	3.2%	16.9%	375%	337
Russian	45	2.5%	32.3%	1,360%	140
Korean	37	2.1%	52.7%	97%	71
Others	310	17.2%	13.2%	525%	2,355
World total	1,802	100.0%	26.6%	399%	6,768

As Internet access and online content production extends to more countries throughout the world, and advances in hardware and software make online communication easier in a broader array of scripts, discrepancies in access and use by language are narrowing. According to a rough analysis of Internet users by language group, there are now nearly as many speakers of Chinese online as speakers of English (see Table 3).

The vast size of the Web, its rapidly changing nature, and the difficulties of sampling its content all make measurement of linguistic material online a complex undertaking. Perhaps the most in-depth attempt to do so is presented by Pimienta, Prado, and Blanco (2009). By tracking the number of occurrences of 57 culturally neutral word-concepts of eight European languages on search engines (e.g., ambiguity, causality, cheese, compatibility, contiguity, dangerous, December, density, disparity, divisibility, elasticity, electricity), their research project calculated the presence of these eight languages on the Internet for 13 separate time periods from September 1998 to November 2007. The study found that the global percentage of English on search engines decreased from 75% in 1998 to 45% in 2005 and has since remained at that level. The authors suggest that the English presence on the Web is probably lower than its presence as identified by search engines, since search engines sometimes mischaracterize pages written in other languages as English; they estimate the actual Web presence of English to be “probably below 40%” (p. 33).

Web sites in languages other than English are increasing not only in size, but also in popularity. Seven of the twenty most visited Web sites in the world are now in languages other than English, including five major sites in Chinese: the Baidu search engine, the Tencent Internet portal, the Taobao shopping site, Google’s Chinese-language site, and the Sina.com infotainment portal (Alexa, 2010).

The steady growth of linguistic diversity online can also be seen in analysis of wikis, blogs, and tweets. Though the international online encyclopedia Wikipedia was first launched in the USA, as of January 2010 only about 22.5% of its more than 14 million articles were in English, with the rest published in 260 other language versions. Arabic, for example, has some 118,000 articles, though that still represents less than 4% of the articles available in English. As for the blogosphere, one study suggested that in the fourth

quarter of 2006 there were more blog postings in Japanese than in English (Sifry, 2007). A recent study of Twitter found that, between February 8 and February 10, half of tweets posted were in languages other than English, with Japanese (14% of total tweets), Portuguese (9%), Malay languages (5%), and Spanish (4%) constituting the largest language groups other than English on the micro-blogging site (Semiocast, 2010).

The growth of content in diverse languages around the world means that people in many countries no longer need to rely on Internet content created in the USA or a handful of other wealthy countries that may or may not meet local needs. However, this growth has not resolved another inequity—that related to crosslinguistic communication. Simply put, the Internet, by enabling more international communication than any other media at a time when English was already asserting itself as a global language, has served to accelerate and amplify the dominant role of English as a global lingua franca (Crystal, 1997). Though people can increasingly use their own language for conversing online within their language community, when they venture out to broad international forums they must often use English, thus further privileging both the English language and its native speakers.

Finally, though the Internet has exacerbated existing linguistic inequality, it has also been deployed to protect linguistic pluralism. By connecting small numbers of speakers spread at great distance, and allowing the video, audio, and textual archiving of elders' voices and words that may have otherwise been lost, the Internet has been used to help preserve minority and endangered languages in Hawaii, New Zealand, and elsewhere (see, e.g., Warschauer, 1998).

Conclusion

The digital divide is a broad phenomenon, intersecting with issues of, race, class, gender, income, nationality, age, and education. Among the factors strongly correlated with Internet access and use is language background. In the USA, speakers of English are far more likely to have Internet access than non-English speakers, especially among the large Hispanic community. Internationally, though the dominance of English on the Internet has reduced, English still predominates as a lingua franca for cross-national online discourse. However, the Internet can also serve linguistic pluralism, as speakers of endangered languages work to preserve and revive their languages online. As the Internet evolves, how it is accessed and used will undoubtedly continue to be related to issues of language.

Language Assessment in Program Evaluation

LARRY DAVIS

Introduction

Program evaluation techniques are of increasing interest to language programs hoping to address pressures stemming from the current climate of accountability, and also contribute to a variety of other important purposes such as demonstrating program worth or satisfying the mandates of accrediting bodies (Norris, 2009; Watanabe, Norris, & González-Lloret, 2009). A central feature of program evaluation is the systematic collection of information for decision making or other uses, with assessment being one important method for collecting such information. Within program evaluation, assessment may itself serve a variety of purposes and take a variety of forms, from standardized tests used to judge value or compare programs, to local classroom-based assessments used to provide focused information for program improvement. This entry will briefly: (a) define the terms evaluation, assessment, and measurement; (b) describe the uses of assessment within program evaluation contexts; (c) discuss validity issues as they pertain to assessment within evaluation; (d) describe some common types of assessments; (e) provide some examples of assessment in use; and (f) discuss a number of issues to consider when using assessments. Throughout, consideration of assessment usefulness for the evaluation purpose(s) at hand will be used as an organizing theme.

Definitions: Evaluation, Assessment, Measurement

The term evaluation has been used in a variety of ways. Evaluation has traditionally been viewed as an exercise where the purpose is to judge the worth of a program (Lynch, 1996; Rea-Dickins & Germaine, 1998), while more recently, advocates of utilization-focused evaluation (e.g., Patton, 2008) have promoted the view that evaluation is a “multi-purpose, multi-method, contextualized undertaking, rather than a monolithic approach to judging program worth” (Norris, 2008, p. 72). It has also been noted that the term assessment is often equated with standardized tests or other types of objective measurements, which has contributed to misconceived assessment practices (Norris, 2006). Given the diversity of approaches and activities in program evaluation, it is critical that basic terms be clearly defined. For this entry, Norris’s (2006) definitions will be used:

1. *Evaluation* is the gathering of information about any of the variety of elements that constitute educational programs, for a variety of purposes that primarily include understanding, demonstrating, improving, and judging program value. Evaluation brings evidence to bear on the problems of programs, but the nature of that evidence is not restricted to one particular methodology.
2. *Assessment* is the systematic gathering of information about student learning in support of teaching and learning. It may be direct or indirect, objective or subjective, formal or informal, standardized or idiosyncratic, but it should always provide locally useful

2 LANGUAGE ASSESSMENT IN PROGRAM EVALUATION

information on learners and on learning to those individuals responsible for doing something about it.

3. *Measurement* is the consistent elicitation of quantifiable indicators of well-defined constructs via tests or related observation procedures; it emphasizes efficiency, objectivity, and technical aspects of construct validity (p. 579).

These definitions are used because (a) they explicitly acknowledge that assessment may include a variety of techniques, and (b) they focus on the use of information produced by assessment. To clarify further, as used here assessment refers to the appraisal of language abilities and achievements of individuals while evaluation refers to activities that address program-level issues. It should also be noted that these terms are hierarchical: measurement is one type of assessment, while assessment is one type of evaluation activity (Lynch, 2003).

Uses of Assessment

Assessment provides findings that serve a variety of purposes in program evaluation. Such purposes have been conceptualized in various sorts of ways, but major uses include *judgment*, *quality control*, *demonstrating value*, *improvement*, and *knowledge creation* (adapted from Kiely, 2009). Judgment, or the appraisal of program value, is perhaps the use most often associated with program evaluation and connected assessments. As used here, judgment refers to situations where the issue of interest is the extent to which a program meets certain criteria, with the impetus for evaluation (and criteria for judgment) often being external to the program. Therefore judgment uses include assessment and evaluation mandated by funding entities, and any other situation where accountability in terms of results is the primary concern. Judgment uses are often associated with language measures such as standardized or locally produced tests.

Quality control also addresses accountability concerns, but in this case the focus is to ensure that procedures are in place for collecting and using data on program effectiveness; the results themselves are of less direct interest. Assessment of student learning outcomes (SLOs) to satisfy university accreditation requirements is a common example of this type of use. The impetus for assessment may be internal (such as pressure from administrators) or external (such as accrediting bodies); additionally, the learning outcomes themselves may be externally specified (as in accreditation of US teacher training programs) or defined by the local program (as in US university accreditation). A wide variety of assessments are used for quality control purposes, but within SLO assessment these may include some form of proficiency measure (such as an oral proficiency interview) along with assessments that address other language-related knowledge, skills, or attitudes (such as student portfolios or self-assessments).

Language programs may also use assessment to demonstrate the value of the program to various stakeholders, such as students, administrators, or the public. In this case there is an internal impetus to show that the program does good work, for purposes such as improving the reputation of the program or for attracting students. Again, a wide variety of assessments may be used for this purpose. The need to impress may lead to use of recognized measures of language ability that will be accepted by the target audience (e.g., Bernhardt, 2006), but other assessments that demonstrate program effectiveness, or convey a concern for effectiveness, may also serve this purpose.

Program improvement (or development) is arguably one of the most important uses of language program evaluation and assessment, even when evaluation is initially conducted for accountability reasons (Norris, 2006). Improvement includes any use of assessment findings to develop or modify curriculum, teaching, or other aspects of the program to

increase program effectiveness. Accordingly, assessments used for improvement ideally provide maximal feedback regarding program function; local assessments are therefore well suited to this purpose. In contrast, externally developed tests of broad language constructs, such as standardized oral proficiency interviews, may not by themselves provide the level of detail necessary to suggest specific actions for improving programs (Norris, 2006).

A final use of assessment has been knowledge generation. Knowledge generation focuses on producing generalizable statements about the value of a particular language theory, teaching method, or program approach. This use is often associated with quasi-experimental designs that employ language measures to compare treatment and control groups. Knowledge generation was a common impetus for early language program evaluations but has become rare with the recognition that studies of real programs typically lack the control needed to produce generalizable results (Kiely & Rea-Dickins, 2005).

Assessment Validity in Evaluation Contexts

Validity is a fundamental concern in educational measurement (American Educational Research Association [AERA], American Psychological Association [APA], & National Council on Measurement in Education [NCME], 1999), and accordingly is an important issue in language program evaluation contexts. Validity is commonly defined as the degree to which a test actually measures what it claims to measure; that is, validity is ultimately based on the construct being quantified (Messick, 1989). It is also important to note that validity pertains to the specific use of a measurement, not the measurement itself (Bachman & Palmer, 1996; AERA, APA, & NCME, 1999). This model of validity applies most directly to measurements, which focus on the quantification of construct-related behaviors. Assessment, however, is a superordinate category that also incorporates data collection procedures that are less focused on quantification and have less to do with carefully defined constructs (Kane, 2001; Lynch, 2001). Accordingly, standard approaches to validity may in some cases be of little help in judging whether the use of an assessment is justified.

How then might the use of an assessment be warranted? In keeping with a use-focused approach to evaluation, intended use has been proposed as an organizing framework for evaluating whether an assessment is appropriate for a given situation (Bachman, 2005; Norris, 2008). For measures, the intended use of the measure dictates the information needed to demonstrate the validity of the instrument for the purpose at hand. For other types of assessments, usefulness itself may serve as an important criterion for judging quality. For example, when the assessment focus is on providing feedback to learners (as in educative assessments; Wiggins, 1998) the ability of the assessment to support learning is typically of greater concern than psychometric validity (Moss, 2003). Similarly, within program evaluation, the detail, relevance, interpretability, and general usefulness of an assessment for improving program effectiveness may be of equal or more importance than construct-related accuracy (Patton, 2008). This is not to say that traditional validity concerns are unimportant or that sloppy assessment practices should be tolerated; rather, given the wide variety of purposes and contexts found in language program evaluation, flexibility is required in judging the suitability of an assessment for a particular situation.

Types of Assessment in Language Program Evaluation

The purpose of this section is to very briefly describe a few of the major types of language assessments and how they are used in program evaluation. For more information regarding specific assessments or language assessment in general, the reader is directed to the extensive literature on this subject.

4 LANGUAGE ASSESSMENT IN PROGRAM EVALUATION

Standardized and Other Published Language Tests

- These tests often focus on the measurement of relatively broad constructs (such as general language proficiency) and may take a variety of forms and measure a variety of language constructs.
- Standardized tests are useful for accountability purposes, demonstrating program value, or when there is otherwise a desire to compare outcomes with other programs (Norris, 2006).
- The interpretation of test results can be challenging; test scores may shed little light on the processes that produced the scores. Additional data are often needed to interpret fully what scores mean within a given program (e.g., Llosa & Slayton, 2009).

Locally Developed (or Modified) Language Tests

- Locally developed tests focus on the measurement of languages or constructs of local interest. They are useful when published tests are unavailable or fail to provide adequate information for local needs.
- These tests are useful for accountability purposes when comparison with other programs is not a concern, and the local focus may increase their usefulness for program improvement. A drawback is that considerable time and expertise may be needed to produce local tests and verify their validity for the intended use.

Portfolios and Other Alternative Assessments

- Alternative assessments are generally defined as assessment procedures that are closely integrated with instruction, feature authentic and contextualized tasks, and are aimed toward providing feedback to learners, teachers, and others (Brown & Hudson, 1998; Wiggins, 1998; Brown, 2004).
- Student portfolios are perhaps the most common example of alternative assessment in language program evaluation, but other alternate assessments include essays/theses (sometimes combined with an oral presentation), work samples, or existing classroom assessments.
- Alternative assessments such as portfolios are often used for quality assurance (such as SLO assessment) and for improvement purposes, given that they provide highly contextualized data on student achievement.

Self-Assessments (Surveys/Questionnaires/Interviews)

- Self-assessments collect self-report data and include well-developed measures of constructs such as cultural attitudes or motivation, as well as locally developed assessments addressing specific aspects of learning.
- Self-assessments are commonly used for quality control and improvement purposes, perhaps partly due to their flexibility and the relative ease of data collection. Self-assessments also provide a method of assessing individuals who have already exited the program (e.g., alumni surveys) and are useful for collecting data on learning outcomes such as valued dispositions (e.g., appreciation of multiculturalism) that might otherwise be difficult to examine using tests or other behavioral assessments.

Observation

- Observations may be employed to collect information on language abilities used in context (Lynch, 2003), although observations are more typically used to collect information regarding the learning context itself, such as the characteristics of instruction within a particular class or program.

Examples of Assessment in Language Program Evaluation

Given the inherently idiosyncratic nature of each evaluation, decontextualized descriptions of assessment inevitably fall short of capturing the actual diversity of assessment use. Therefore, the following examples are provided to illustrate a few ways in which assessments might be used in evaluation contexts. These examples vary in terms of: (a) the impetus for evaluation (external or internal), (b) the characteristics of the program, (c) the types of assessment used, and (d) the purposes for assessment. Additional examples may also be found in Kiely and Rea-Dickins (2005), Norris (2009), Rea-Dickins and Germaine (1998), and several other collections listed in the additional readings.

Example 1: Effectiveness of a Teaching Methodology (Beretta & Davies, 1985; Beretta, 1992)

The evaluation was focused on judging and demonstrating the effectiveness of a new English teaching methodology which had been implemented on a trial basis in Bangalore, India. The methodology was considered to be innovative in terms of its communicative focus and task-based approach. In the last few months of the five-year trial, treatment (modified instruction) and control (regular instruction) groups were given two locally developed achievement tests (a structure-based test and a task-based test) and three local language proficiency tests (dictation, contextualized grammar, and communicative listening/reading). Immediately following program completion, other data were collected regarding the stage of implementation of the methodology (via teacher self-report), the types of concerns mentioned by teachers, and an analysis of error treatment in a small collection of recorded lessons.

Treatment students performed better on the assessments, but problems in implementation of the study seriously complicated the interpretation of assessment findings. First, the treatment teachers were generally better trained, more confident, and more motivated than their colleagues in regular classrooms, which likely influenced student achievement. Second, treatment groups almost certainly received some degree of explicit error correction, violating a central tenet of the new methodology and raising the issue of what method, exactly, had been implemented. A late start for the evaluation also meant that it was impossible to collect systematic classroom data that might have clarified the implementation issue. Third, the specific uses for the resulting data were never defined within the evaluation. Overall, this example demonstrates the inherent difficulty in trying to conduct controlled studies within educational contexts, as well as the problems that can arise when the need for evaluation and assessment are considered late in the game and uses for the resulting data are poorly considered.

Example 2: Curricular Innovation With a Built-In Evaluation Component (Lynch, 1992)

The evaluation targeted a curriculum for developing the ability to read English for science and technology (REST), which was being implemented at the University of Guadalajara in collaboration with the University of California, Los Angeles (UCLA). A primary goal of the evaluation was to incorporate both quantitative and qualitative data to inform program decision making and improvement. Assessments included a norm-referenced ESL placement test used at UCLA, a locally developed fill-in cloze test based on a science magazine article, and a local multiple-choice cloze that was intended to address more closely the vocabulary and reading skills taught in the curriculum. Assessments were administered to program students at the start of instruction (September) and again in February and May; student volunteers from outside the program also took the placement test in September and February and the cloze tests in May for comparison purposes. Large

amounts of supporting qualitative data were obtained via teacher and administrator journals, interviews with teachers and students, classroom observations, and a questionnaire designed to gauge staff understanding of curricular objectives and their opinions of the strengths and weaknesses of the program.

The assessments generally showed modest gains in overall language and reading ability among program students, but questions were raised regarding the appropriateness of the assessments for investigating the effectiveness of an academic reading program. In particular, there was no assessment that directly addressed the specific skills being taught. The qualitative data suggested a number of issues that might be targeted in improvement efforts and illuminated the sources of these issues, but collection and analysis of the data were highly time-intensive. Overall, the quantitative assessments provided data useful for judging and demonstrating the value of the program, while the qualitative results applied more directly to program improvement; together, the two approaches provided a deeper understanding of program effectiveness than either alone. This particular example is also notable in that evaluative assessment was included from the very start of the project.

Example 3: A Large-Scale Evaluation of Educational Effectiveness (Llosa & Slayton, 2009)

The evaluation focused on a computer-based English literacy intervention for at-risk kindergarteners and first graders which had been implemented in a number of schools in a large urban school district (Los Angeles). The primary focus of the evaluation was judgmental but the evaluation also contributed to program improvement. Specifically, the evaluation was intended to determine: (a) the degree to which the program improved reading achievement, and (b) the extent to which the program was being implemented. To examine these questions, a quasi-experimental design was employed where 100 kindergarten and first-grade classrooms (200 in total) were split into matched treatment and comparison groups of 50 classrooms each. A standardized test of reading ability (Woodcock Reading Mastery Test) was administered to random samples of 10 students (treatment group) or 5–10 students (comparison group) from each class. In addition, implementation of the program was evaluated through the use of classroom observations, teacher interviews, and computer use records.

The standardized test results showed that students receiving the intervention tested no better than students from comparison classrooms. The implementation data showed that the program as a whole had been poorly integrated into classrooms and was generally not implemented or used as intended. These supporting data made it possible for evaluators to contextualize the standardized test results and suggest possible actions for improving the usefulness of the program. Ultimately, the school district decided to forego expansion of the program beyond the initial trial schools, and where the program was already in place, made efforts to improve implementation. This example illustrates the importance of multiple approaches to data collection, and the need to contextualize measurement if the resulting data are to be useful for program improvement.

Example 4: Outcomes Assessment in an Undergraduate Foreign-Language Program (Grau Sempere, Mohn, & Pieroni, 2009)

The evaluation took place within an existing US college department of foreign languages program at the University of Evansville, Indiana, where the program was in the process of defining student learning outcomes and developing related assessments. Purposes for the effort included demonstrating program value, quality control, and program improvement. A variety of assessments were used to investigate the achievement of learning outcomes, including a graduation portfolio (to assess a variety of outcomes), a portfolio

presentation in the target language (to assess speaking and listening skills), and student self-assessments of their learning (originally an exit interview, later changed to an online survey). An off-the-shelf reading test was also briefly used to fill a perceived gap in the other assessments; this test was later eliminated because of perceived problems in test design and a search for a replacement was under way.

Initial results suggested that expected learning outcomes were largely being met, but minor adjustments were needed. For example, French students were not using literary theory in their papers, so French literature courses were revised to include greater coverage of literary theory. This evaluation example demonstrates an approach to outcomes assessment that focuses on local assessments, carefully articulated to locally valued outcomes. The report also contains a helpful description of how assessments were adjusted to better suit the intended uses.

Caveats and Conclusion

As a final point, it is worth mentioning a few of the potential pitfalls associated with the uses of assessment in evaluation. One error is the selection of a standardized test or other well-known measure based on the assumption that the test is valid because it has been the subject of extensive validation studies. This has been referred to as the *valid test fallacy* (Norris & Ortega, 2003), with the fallacy being the notion that the test is valid regardless of the context or use. On the contrary, as mentioned earlier it is the specific use of a test that is valid or invalid, not the test itself.

A second error occurs when assessment concerns come to direct or supplant other evaluation activities, something that might be termed *assessment-driven evaluation*. For example, when outcomes assessment is undertaken in response to outside accountability pressures, one tendency is to focus on doing assessment rather than using assessment (Norris, 2006). That is, decision making focuses on the selection of assessments, with little thought given to use of the resulting data. This may result in the use of off-the-shelf global assessments simply to get assessment done, with the resulting scores saying little about issues of real interest for teaching and learning.

A third error is a lack of adequate depth or diversity in data collection and analysis; in most evaluation contexts a variety of assessments and other data will be needed to support decision making. As seen in the Llosa and Slayton (2009) example, carefully considered supporting data can play a crucial role in understanding what test results mean. Triangulation of data, along with thorough analysis, also helps to prevent the unintentional or willful misinterpretation of results (Norris, 2009).

A final error is to fail to include evaluation users in the selection of assessments. Such inclusion is necessary because it is the evaluation users who will ultimately decide if an assessment is adequate; they are the ones who will eventually use, or ignore, the results (Patton, 2008). Rather than making methodological decisions, in Patton's view "the utilization-focused evaluator advises users about options; points out the consequences of various choices; offers creative possibilities; engages with users actively, reactively, and adaptively to consider alternatives; and facilitates *their* methods decisions" (p. 385; italics in the original). A failure to include users in decision making may result in assessments that have little credibility or intelligibility, and when users do not find an assessment believable or understandable then the results may be contested or simply disregarded.

To conclude, this entry has taken the position that the purpose of assessment in program evaluation is to provide information that serves the needs of the evaluation users. Although usefulness is an important feature of any language test (Bachman & Palmer, 1996), within program evaluation intended use is the fundamental factor that drives assessment. That is to say, "assessments are only good insofar as their use does good" (Norris, 2008, p. 241).

Language Assessment Literacy

OFRA INBAR-LOURIE

Introduction

Language assessment literacy forms the knowledge base needed to conduct language assessment procedures, that is, to design, administer, interpret, utilize, and report language assessment data for different purposes. The term is derived from the generic *assessment literacy* concept which refers to the knowledge and skills required for performing assessment-related actions (Stiggins, 1991; Webb, 2002). Language assessment literacy encompasses not only familiarity with tools and procedures for evaluating students' language abilities, but additional components, particularly the ability to render apt feedback so as to effectively direct learners toward setting and reaching future learning targets. Furthermore, assessment literate professionals are also aware of the ethical aspects involved in the assessment process and of the possible ramifications of putting assessment-based decisions into practice, hence consequential validity (Messick, 1989).

Interest in this area can be traced to the powerful trend of test-based accountability systems evident in many educational systems since the 1980s (Barber, 2004; Menken, 2008). Given that accountability is based on reliable information about students' achievements supplied by teachers and schools (Stiggins, 1998; McKay & Brindley, 2007), the assessment community presently incorporates not only trained testing experts but also administrators, policy makers, and most of all, teachers engaged in various aspects of monitoring and reporting students' learning gains according to set standards (Mertler, 2002; Davison & Leung, 2009). The unprecedented number of stakeholders currently involved in practicing assessment has necessitated deliberation of the knowledge and skills which constitute assessment expertise and its attainment. The following review will first delineate the components of assessment literacy as surveyed in the literature then focus on the particular elements of language-related assessment knowledge.

Background

Current perceptions of the knowledge required for conducting assessment activities are shaped by beliefs about the prominent role of assessment in fostering learning, referred to as "*assessment for learning*" (Gipps, 1994; Broadfoot & Black, 2004). The term denotes ongoing student-related and context-embedded evaluation which formulates and advances the learning process. The approach has taken shape over the last two decades, prompted by a number of factors: the recognition of the social role of assessment and the power embedded in assessment decision making (Filer, 2000), the move toward using alternative assessment procedures (Gipps & Stobart, 2003), and recognition of the importance of formative assessment in promoting learning (Black & Wiliam, 1998). It follows the realization that choice of assessment or testing practices reflects profound notions about knowledge and learning, ideologies, social expectations, attitudes, and values which constitute "a culture." The culture can be representative of assessment versus testing assumptions and beliefs, that is, an *assessment culture* versus a *testing culture* (Wolf, Bixby, Glenn, & Gardner, 1991; Shepard, 2000; Lynch, 2001; Inbar-Lourie, 2008a).

2 LANGUAGE ASSESSMENT LITERACY

Assessment for learning is contrasted with “*assessment of learning*” which alludes to the use of external measures, usually in the form of standardized tests, to determine language-learning levels for various purposes (Gardner, 2006). The two approaches differ in terms of the philosophical principles which motivate them. While *assessment of learning* is positioned in positivist stands, *assessment for learning* has its roots in constructivist sociocultural beliefs which see the participants as partners in a learning community that aims to empower and improve learning via assessment (Lynch & Shaw, 2005; Stiggins, Arter, Chappuis, & Chappuis, 2006).

However, concurrently, along with the emphasis on formative assessment, seemingly contradictory phenomena are in motion. Institutions and educational systems worldwide have instituted prescribed standards for teaching and assessment as a means for achieving accountability and attaining excellence, often with detrimental consequences (Menken, 2008). Though this implies increased external monitoring, school authorities and especially teachers are also part of the process, expected to align their evaluations and report them to various stakeholders in accordance with set parameters (Davison, 2004). In order to fulfill these responsibilities practitioners at various levels need to be knowledgeable in conducting assessment practices using a variety of suitable tools, and in making decisions based on the collected data. It is this comprehensive understanding which is referred to as *assessment literacy*, a term coined by Stiggins in 1991.

The language assessment profession has embraced the notions of assessment for learning and the principles which underlie it marking a major shift from a language-testing focus toward acknowledgment of the merits of school and class-based assessment (Rea-Dickins, 2004, 2007; Davison, 2007; Davison & Leung, 2009; Hamp-Lyons, 2009). Teachers are consequently currently viewed as central protagonists in the assessment process, expected to augment data from internal and external sources for formative and summative decision-making purposes (Brindley, 2001; Leung, 2004; Black, 2009).

Furthermore, the language assessment field is increasingly positioning assessment as a social activity (McNamara, 2001; McNamara & Roever, 2006), arguing against using (or abusing) test results for political, economic, social, and gate keeping agendas instead of for promoting language access (Shohamy, 2001; Broadfoot, 2005). This has led to the realization that the professional language testing community needs to expand and reach out to other stakeholders who will speak up against assessment misuses and biases by gaining insight into the world of assessment and ethical codes of practice, that is, into assessment literacy (Taylor, 2009).

Assessment Literacy

What precisely is the knowledge base required for performing assessment tasks? The American Federation of Teachers, National Council on Measurement in Education, and National Education Association identified the components of assessment knowledge teachers require for educational assessment in a set of seven standards (AFT, NCME, & NEA, 1990). Though produced two decades ago, these standards still provide a worthwhile framework for assessment literacy for they touch upon the various phases of the assessment process including choice of the appropriate assessment tool, administration, scoring, and analysis of “both externally produced and teacher-based assessment methods,” using the results for student advancement, assessment, and curriculum-related purposes, developing valid means for grading, reporting the results to various stakeholders, and “recognizing unethical, illegal, and otherwise inappropriate assessment methods and uses of assessment information” (pp. 31–2).

Popham (2003) notes the lack of assessment knowledge among stakeholders directly or indirectly involved in assessment practices and assessment decision making, such as

policy makers, legislators, administrators, teachers, students, and the public at large, urging for the establishment of suitable assessment literacy programs. Taylor (2009) notes that applied linguists are often asked to advise on language assessment issues even though they lack the necessary theoretical and practical skills, with graduate programs seldom providing a thorough background in basic assessment principles. In order to ensure quality evaluation McMillan (2000) lists fundamental assessment principles teachers and administrators should be aware of. These include linking assessment and instruction and the need to ensure the fairness and ethicality but also the feasibility and efficiency of assessment practices. In addition, assessment literate professionals need to be aware of the tensions involved in assessment-based decision making, and the infusion of technological advancement as part of any future assessment endeavors.

Of the stakeholders in need of obtaining assessment literacy, attention is focused primarily on teachers. A number of research studies have investigated the scope of teachers' assessment literacy, some using a classroom assessment literacy inventory (CALI) based on the "Standards for Teacher Competence in the Educational Assessment of Students" (AFT, NCME, & NEA, 1990) quoted above (Mertler, 2002; Mertler & Campbell, 2005). The studies have pointed at the need to reinforce assessment skills among teachers at both the pre and in-service levels, and particularly at the need to focus more intensely on assessment issues in teacher education programs (Art & Kelting-Gibson, 2006; Volante, & Fazio, 2007; Koh, 2009; Mertler, 2009). Similarly in the area of language teaching, concern is voiced as to the lack of training particularly vis-à-vis the growing need for teachers' assessment expertise in matching assessment to curriculum standards, and in being familiar with current influential assessment frameworks (Malone, 2008; Cumming, 2009).

Although the significance of assessment literacy has been acknowledged, there are still many uncertainties as to the nature of this concept particularly with regard to the relative weight of the literacy components, that is, which is essential, negligible, both essential and negligible, or even dispensable. Another contentious issue relates to the "one size fits all" dilemma, that is, should everyone dealing in assessment be supplied with an identical or differential assessment literacy menu, and whether teachers, for example, should be familiar with the theoretical underpinnings of assessment practices or just with the hard core of hands-on assessment know-how. This becomes crucial when prioritizing contents for assessment courses or programs intended at enhancing the acquisition of assessment literacy principles (Brindley, 2001; Brown & Bailey, 2008; Inbar-Lourie, 2008b).

The dilemma central to this discussion, however, is whether the attainment of generic assessment literacy concepts provides a sufficiently solid basis for practitioners in specific subject areas, such as language teaching, or whether evaluation in these specialized areas requires in-house expertise. The following section will discuss this predicament focusing on the concept of language assessment literacy (LAL). The discussion rests on three pillars: establishing the need for specific domain-relevant LAL for conducting assessment-related activities, the nature of LAL, and the notion of differential LAL knowledge.

Language Assessment Literacy

It is argued that performance of language assessment functions, such as analyzing and determining the worth of language samples, diagnosing language learning difficulties, determining phases of language learning development, and discerning pragmatic, syntactic, and semantic competencies, requires a specialized knowledge base. This expertise is grounded in the general educational assessment principles represented in assessment literacy frameworks, but includes additional distinctive language learning and hence language assessment components. The merge creates a unique knowledge base shared by language assessment professionals and imparted to various audiences in *language testing*

(or “*language assessment*”) modules (Inbar-Lourie, 2008b). An array of textbooks which vary in their contents but share a language assessment orientation (Davies, 2008), can be used to guide novices in acquiring both the general assessment literacy, and the particular idiosyncratic components which pertain to evaluating language abilities. In addition, the unique features of language testing as a professional body are reflected in codes of practice published by the major organizations in the field (Davies, 2008; Taylor, 2009). These have taken a meaningful role in establishing and solidifying the properties language testers need to abide by, particularly in the areas of ethicality and good practice (ALTE Code of Practice, 1994; ILTA Code of Ethics, 2001; ILTA Guidelines for Practice, 2007).

Several recent attempts have been made to allude to the knowledge language testing or assessment professionals require. The definitions vary greatly in terms of the broad or narrow scope they take in endorsing either a technical know-how approach or an in-depth understanding of the domain, including discussion of assessment as a social phenomenon. The definitions also vary in terms of their orientations toward either a testing or an assessment culture, and in their emphasis on language-specific versus general assessment dimensions.

Brown and Bailey (2008) collected data on the components of language testing courses from course instructors, replicating a similar earlier study (Bailey & Brown, 1995). Two implied perceptions of LAL emerge from the research. The first is an emphasis on test construction which is in tune with notions of testing cultures, accentuating the construction, analysis, and interpretation of test items. The second views expert knowledge in assessment as being very much akin to the general educational testing knowledge base with little reference to language related considerations. A similar approach in this latter sense, whereby the emphasis is on general assessment skills, is also apparent in a research by Newfields (2006) on foreign-language teachers in Japan. The questionnaire used for the research refers to using varied assessment tools, the avoidance of bias, the construction, and administration and scoring of tests, evaluating reliability and validity and reporting assessment results, hence lacking in language orientation.

Other definitions are broader in that they encompass variables that focus on test impact, ethics, and professionalism. Davies (2008) presents a survey of language testing textbooks as reflective of the past and present trends in the language testing profession. The analysis shows that while in the past the emphasis was placed on “skills” (“the training in necessary and appropriate methodology”), and on “knowledge” (“relevant background in measurement and language description as well as in context setting.”), the present expanded paradigm includes a component referred to as “principles”: “the proper use of language tests, their fairness and impact, including questions of ethics and professionalism” (Davies, 2008, p. 335). Thus one may surmise that according to the above survey current required LAL competencies consist of these three components.

Another suggestion which is both broad and language-focused can be found in an outline for programs for professional development in language assessment presented in Brindley (2001). The framework is modular, meaning that some modules are mandatory while others are a matter of choice depending on individual circumstances and the assessment expertise objectives. All the modules are language-based. They include setting the background and rationale for assessment focusing on social, political, and educational aspects, on issues related to language proficiency and the concepts of validity and reliability, a choice between either test construction or “assessment in the language curriculum,” and an optional module which looks at more advanced assessment issues (Brindley, 2001, pp. 129–30).

Inbar-Lourie’s definition (2008b) perceives LAL as encompassing layers of assessment literacy and language-specific elements. In order to become literate in language assessment one needs to attain knowledge in formative and summative testing and assessment methods,

in interpreting student scores, in understanding the complexities of validity and reliability including current tensions which question the application of traditional psychometric measures to teacher-based assessment (Teasdale & Leung, 2000; Brookhart, 2003; Leung & Lewkowicz, 2006). However, in addition LAL requires familiarity with current approaches in language education and applied linguistics, and with research findings and controversies as they arise in contemporary glocalized societies, for such knowledge is directly related to assessment concerns and practices. (Glocalization refers to the convergence between global trends and local cultural needs central to contemporary societies [Robertson, 1995]. This term is frequently used to characterize the current state of language teaching, in particular English, in various parts of the world [see, for example, Shin, 2007].) For example, current discussions concerning the needs of immigrant learners (Solano-Flores & Trumbul, 2003) necessitate differential assessment formats and test accommodations. Awareness of the consequences of implementing the assessment procedures and of issues of fairness and ethicality (Kunnan, 2000) will provide the language assessor with critical lenses through which to analyze and construct more democratic assessment procedures (Shohamy, 2001). In terms of language pedagogy, familiarity with current teaching approaches for young language learners, for example, is deemed essential for constructing suitable assessment schemes for this vastly growing population (McKay, 2006), and knowledge about local and international assessment standards frameworks (e.g., the CEFR, Council of Europe, 2001) is vital for aligning assessment scores and reporting assessment data. And finally and most importantly, language assessment literate individuals are expected to translate the theory and practice into the construction of robust assessment procedures which will facilitate decision making for both classroom and external purposes (Inbar-Lourie, 2008b).

Though the LAL definitions vary considerably Taylor (2009) positions current perceptions of assessment literacy in the language domain as pertaining not only to various internal and external aspects of assessment practices, but also to the theoretical rationale which inspires them and the adverse results they may have:

This current trend in thinking seems to be that training for assessment literacy entails an appropriate balance of technical know-how, and understanding of principles, but all firmly contextualized within a sound understanding of the role and function of assessment within education and society. (Taylor, 2009, p. 27)

Having established the justification for LAL and surveyed definitions of its essence, the question which still remains relates to the breadth of LAL requirements in the case of different stakeholders, whether identical or differential. One of the major reasons for delving into the fundamental nature and boundaries of assessment literacy lies in the growing numbers of stakeholders currently practicing assessment in various capacities. Warning voices urge language assessment specialists to refrain from a totally inward look which would bring about isolation rather than reach out in the manner which seems crucial at this point in time (Davies, 2008; Taylor, 2009). The question which therefore arises is what level of knowledge do the various individuals involved in conducting language assessment activities require and in what areas, and how much of this knowledge will in each case pertain to the practical methods or to the trait, to generic versus language-specific assessment literacy.

There are two clashing objectives here. On the one hand there is clear awareness of the need to reach out to wider audiences and enable them to set an initial footing in the language assessment terrain. On the other hand, having acknowledged that language assessment constitutes a body of knowledge comprising both theory and practice, literacy in this area requires a primary understanding of its basic components, of the essence of

which it is comprised. Though agreement can probably be reached as to the variability principle which states that LAL is not a standardized commodity, the difficult task ahead is setting the threshold level, a rudimentary core of literacy in the language assessment domain, followed by the formulation of expansion options according to job descriptions in different settings. More research is clearly needed in this area as to what constitutes basic LAL competencies. Such research will facilitate the introduction of a grounded language assessment inventory which will promote fair assessment for learning practices for language learners in diverse contexts.

Language Assessment Methods

JANNA FOX

The first step in an assessment process is a clear definition of the assessment mandate: “the mandate is the constellation of forces that shape design decisions for a test” (Davidson & Lynch, 2002, p. 78). Given the mandate, is a test required? Are there other assessment alternatives? Defining the assessment mandate necessitates clarifying the assessment purpose; and once the purpose has been defined, the focus shifts to precisely what it is we intend to measure—the construct. Construct(s) may be defined *theoretically*, drawing on current understandings of what characterizes the aptitude or ability in the literature; *empirically*, in relation to language use within a specific target domain (e.g., a hospital room or air traffic control tower); or *developmentally*, in relation to specific pedagogical content or learning trajectories (e.g., knowledge of information in a textbook unit, recognition of academic word families, etc.). Only after *why* and *what* have been defined, do we begin to define *how* through our choice of assessment method(s) or response format(s). Language assessment methods determine what test takers are required to know and do, and how their responses will be evaluated. The methods we choose are a critical element in the assessment’s overall *usefulness* (Bachman & Palmer, 1996): “individual test qualities cannot be evaluated independently, but must be evaluated in terms of their combined effect on the overall usefulness of the test” (p. 18).

Test Method and Definitions of Language

The choice of a test method depends on the method’s potential to elicit the type of response or performance that will allow us to make score-based inferences from the test to the construct. However, as is frequently pointed out in the literature (Bachman, 2007; Spolsky, 2008), the choice of test method has also been directly related to how we define language itself. For example, Shohamy (1996) associates traditional testing with a discrete-point era, which was theoretically informed by structural linguistics, and a view of language as the knowledge of discrete structures and rules. During this era, the tradition of testing language as separate skills (i.e., receptive skills: reading, listening; productive skills: writing, speaking) became entrenched (Cumming, 2008). Multiple-choice and other so-called *objective* test formats (e.g., true–false, matching, ordering, etc.) were dominant in this era. Such items have a correct answer and typically satisfy statistical requirements for independence (i.e., knowing the correct answer for one item does not increase the probability of responding correctly to another). Discrete-point test formats generally ask test takers to recognize the correct answer and have therefore most often been used to measure recognition of grammar points, vocabulary, sound contrasts, and so forth, and in tests of the receptive skills (reading and listening). Such items are amenable to statistical analysis, prompting Spolsky (2008) to refer to this era as “psychometrically driven” (p. 447) and Bachman (2007) to describe it as “the skills and elements approach” and “the first approach in the history of language testing to explicitly draw upon both [then] current linguistic theory and views of language learning and teaching” (p. 47). Speaking and writing were typically measured *indirectly* during this era, through correlations with measures of listening and reading.

According to Shohamy (1996), the dominance of discrete-point test methods waned somewhat during the subsequent integrative era, as an increasing number of linguists and applied linguists (e.g., Halliday, 1976) argued that language was more than the sum of its parts; that meaning depended on context, including the context provided by extended texts (Oller, 1979). As such, attempting to measure language in discrete and unrelated items, they argued, risked underrepresenting ability. This perspective gave rise to a new wave of test methods of which cloze, C tests, and dictation were arguably the most popular.

In cloze tests, words are selectively omitted from a passage, and test takers are required to fill them in based on their understanding of the passage as a whole. There are three types of cloze procedures, which differ in relation to the rationale applied for omitting words: random deletion, rational deletion, and the cloze elide. In a random deletion cloze, every *n*th word is deleted (i.e., every sixth word, or seventh word, etc.); in a rational deletion cloze, only certain types of words are deleted (e.g., prepositions, content words, etc.); in a cloze elide, test takers are required to identify incorrect words inserted in a passage. C tests omit parts of words rather than the words themselves, and test takers are required to fill in missing letters. In dictation tests, full passages are read aloud. Test takers are typically required to write out the passage word by word and marks are awarded on the basis of the correct reproduction of the passage. Administration varies in relation to the number of times a passage is read, the speed with which it is delivered, its length and complexity, and whether or not students work alone or in groups to recreate the passage.

Shohamy (1996) notes that the popularity of such methods declined to some extent with the advent of the communicative era in testing and the rise of the *proficiency movement*. Tests based solely on the recognition of language gave way to increased testing of how language is used in interpersonal communication. This era ushered in the widespread direct testing of writing and speaking. Essays became the favored method of testing writing; oral interviews the preferred approach for testing speaking. Thus, *subjective* judgments became an issue in the scoring of test performance, and this gave rise to the need for rating scales to structure and systematize raters' evaluations. It was during this period that the Interagency Language Roundtable (ILR) scale (Clark & Clifford, 1988) was developed as a scale for marking speaking proficiency in the oral proficiency interview (OPI). Luoma (2004) points out that the ILR was "the parent" (p. 62) of the American Council for the Teaching of Foreign Languages (ACTFL) speaking scale (ACTFL, 1999), and that, in effect, the "level descriptions defined the outline of the ACTFL interview itself," because testers "needed evidence about the skills mentioned at each of the levels" (pp. 62, 67). The OPI and its tape-mediated cousin the simulated oral proficiency interview (SOPI) also included role-play components, which required test takers to take on roles and respond in relation to a situation defined in the test.

Huot (1990) traces the dramatic increase in the direct testing of writing to Cooper and Odell's (1977) anthology, *Evaluating Writing*. He notes: "before the improvement of direct testing procedures for writing, the score a paper received could more likely depend on the rater than on the qualities of the paper itself" (p. 237). Cooper and Odell, Diederich (1974), White (1985), and others contributed systematic procedures for rating compositions, which dramatically increased inter- and intra-rater reliability. Tests of writing during this period were largely characterized by timed, impromptu essays that asked test takers to respond in writing to prompts such as "'Life is a game.' Agree or disagree" (from the test preparation booklet for the test of written English [TWE]; ETS, 1999).

Throughout the 1970s and 1980s, considerable effort was invested in the development of rating scales to define what would be valued in a piece of writing. Three different scale approaches received the most attention: primary trait, analytic, and holistic. Primary trait

scoring (Lloyd-Jones, 1977) asks raters to attend to traits of relevance to the rhetorical situation created in a test by the interaction of purpose, audience, and task. If, for example, the task asked the test taker to define the steps in a process, the logic and coherence of the steps would be rated as one of the primary traits of an effective piece of writing. Primary trait scoring was regularly used in large-scale assessments such as the National Assessment of Educational Progress (NAEP). Analytic scoring (e.g., Diederich, 1974) identifies key qualities of effective writing (e.g., content, organization, expression, etc.) and judgments of writing quality are dependent upon how well test takers manage each of the components. In some analytic scales, different components are weighted more heavily to reflect their importance. Holistic scoring is based on a rater's general impression of the overall quality of a piece of writing, which is guided by criteria that define levels of proficiency or competence. It is important to underscore the relationship between scale and task: the scale dictates which features of writing are valued and is therefore an integral part of assessment method.

By the end of the 1980s, the *four skills* division in language testing was being challenged by new models of language ability. Canale and Swain's model (1980) defined communicative competence as "the relationship and interaction between grammatical competence, or knowledge of the rules of grammar, and sociolinguistic competence, or knowledge of the rules of language use" (p. 6). They viewed communicative performance as "the realization of these competencies and their interaction in the actual production and comprehension of utterance" (p. 6). Bachman (1990) extended the Canale and Swain model (introducing organizational and pragmatic competence, and their subcomponents) in his model of communicative language ability (CLA). He argued that performance on language tests was "a function of both an individual's language ability and the characteristics of test method" (Bachman, 2007, p. 54). He proposed two frameworks to account for language elicited on tests: CLA and test method facets, which he defined as "features that determine the nature of language performance that is expected for a given test or test task" (p. 111).

These shifts in the theoretical conceptualization of language were linked to new test methods in what Shohamy (1996) refers to as the performance testing era. Unlike the oral interviews or essays of the communicative era, performance assessment took *context* into account and valued a kind of mirror validity (Shohamy, 1996) of *real* or *authentic* language use. As a result, tests increasingly used tasks, which elicited complex, situated performances. Bachman and Palmer (1996) recast CLA as language ability, and test method facets as task characteristics, arguing that "the characteristics of the assessment tasks needed to correspond to the characteristics of tasks in the test takers' target language use (TLU) domain" (Bachman, 2007, p. 55). Thus, in the performance era, language samples on a test were elicited by tasks that represented language use in a target domain. Although performance assessment might occur "live" in a target domain (i.e., a university classroom, control tower, hospital room, etc.), most performance-based language tasks were designed to *simulate* the context, while eliciting domain-specific language.

McNamara (1996) distinguished between a strong and weak form of second language performance assessment. Strong forms of performance assessment incorporated aspects of successful task performance in the evaluation; weak forms assessed only the language that was elicited—not the task performance itself. Recently, much interest (see, e.g., Cumming, 2008) has been directed at the use of integrated tasks in performance assessment (e.g., in an academic domain, listening to a lecture, reading a text, and then responding in writing by drawing on information from both). With the advent of the TOEFL iBT (Internet-based Test of English as a Foreign Language), more research will no doubt be forthcoming on integrated tasks.

The Assessment Movement

The final era considered by Shohamy (1996) was defined as *alternative*. It was characterized by some as a movement away from testing culture to assessment culture and the increased use of alternative assessment methods, for example, portfolios, self- or peer-assessments, observational checklists, diaries, learning logs, and so forth. Testing culture was associated with *summative* purposes for assessment and the measurement of products or outcomes (i.e., *assessment of learning*). *Formative* assessment, however, is the daily assessment that drives a teacher's agenda in a classroom by providing information on the state of learning and prompting her next pedagogical steps; it is, essentially, *assessment for learning*. This type of assessment has been under-theorized, often occurring in an ad hoc and intuitive manner (Rea-Dickins, 2001). Rea-Dickins proposes systematic methods for formative assessment, as do Colby-Kelly and Turner (2007) in their notion of building assessment bridges from proficiency to learning and achievement. Formative assessment approaches are also being enhanced through developments in *dynamic assessment* (DA) (Lidz, 1991). DA systematically melds assessment with instruction within an activity, by focusing on collaborative interaction between the assessor and the assessed. The assessor's role is to support task completion through mediation and intervention. There are two general approaches to DA: interventionist (fixed mediation, which is standardized and therefore quantifiable); and interactionist (variable mediation, which is tuned to the individual learner or group).

Until recently, *diagnostic* assessment has been largely under-utilized and widely misunderstood (Alderson, 2007). Diagnostic approaches focus on "identifying and isolating components of performance" (p. 29) so that instruction may be tailored or targeted to an individual learner's needs (Fox, 2009). As such, "diagnostic measures need not be integrated or task-based, but might be more usefully discrete in nature" (Alderson, 2007, p. 29). This is the case in large-scale diagnostic assessment like the Diagnostic English Language Needs Assessment (DELNA), which utilizes test methods such as the cloze elide. Approaches to computer adaptive tests, which evaluate a test taker's responses online and automatically shape task or item difficulty in relation to response, may be most useful for diagnostic assessment; they have proved problematic or controversial when used for other assessment purposes.

Method Effect

The method used for assessing language ability may itself affect a test taker's performance. For example, cloze tests and C tests produce complex and unpredictable method effects (see Alderson, Clapham, & Wall, 1995, p. 44). Test-preparation classes, background experience, and "coaching" may inflate scores on multiple-choice tests (Oller, 1979; Alderson et al., 1995). Researchers have begun to link differential group performance on tests to linguistic, educational, and cultural interactions between test takers and test items/tasks and raters (see, e.g., Fox, 2003; Abbott, 2007) and to actively investigate potential sources of bias through differential item functioning (DIF) (see, e.g., Zumbo, 2007). The ongoing introduction of new language assessment methods such as those in computer-administered, computer-adaptive, DA, or paired oral assessments underscores the continuing need for such research.

Although some test methods have enjoyed greater or lesser popularity in relation to changing definitions of language, it is important to stress that the usefulness of a test method depends directly on the specific purpose of the test and the construct(s) it is designed to measure. The choice of an assessment method(s), however, is a critical decision in test design and a fundamental consideration in validity arguments.

Language Attitudes in Language Policy and Planning

BERNADETTE O'ROURKE AND GABRIELLE HOGAN-BRUN

A basic premise of modern linguistics is that all languages are functionally equal (Edwards, 1979, 1994). In the same way that anthropologists will not judge the relative worth of cultures, linguists believe that one language is as good and adequate as any other (Grillo, 1989, p. 173; Trudgill, 1983, p. 205). Despite this, languages are often evaluated and judgments are made about their worth as well as that of their speakers, leading to the national distribution and transnational hierarchies of languages that we know today. In applied linguistics such evaluations and judgments are frequently looked at under the generic heading of "language attitudes."

Much of the work on language attitudes has been conducted under the rubric of the social psychology of language. The key tenet advanced was that attitudes exert influence on (language) behavior. Three types of components of attitude are commonly distinguished: cognitive (knowledge-based), connotative (behavioral), and affective (feelings about language). Other disciplines including linguistic anthropology, the sociology of language, and sociolinguistics and education have also shared overlapping concerns and involvement on language attitudes or the social awareness of language. In many of these disciplines the term language attitude is not always explicitly used, with preference given to related concepts such as ideology, opinion, belief, habit, value, evaluation, and perception. As a result a great deal of attitudinal data is often overlooked in many contemporary reviews of language attitude research (Garrett, Coupland, & Williams, 2003).

Language attitude and its related terms frequently appear in the context of language policy and planning. Indeed, it is often an implicit or explicit assumption of much policy and planning that attitudes can or should change (Baker, 1992, p. 97). In some instances such policy and planning are in fact largely, if not principally, concerned with inculcating attitudes either to the language or its speakers (Lewis, 1981, p. 262). Therefore, changing language attitudes, beliefs, or ideologies is often seen as the first step in the process of language revitalization. The quest for (improved) status and solidarity are often regarded as the chief motivating attitudes for language behavior of communities (see Ryan & Giles, 1982). Reversing the low-prestige status and stigmatized identities associated with languages such as Irish, Galician, and Welsh constituted the central language-planning problem facing these minority languages during the 20th century.

The different facets of language-planning measures including status, corpus, and acquisition planning, are often put in place with the intention of changing language attitudes. The role of status planning, for instance, in facilitating the acceptance of a language by members of society, is regarded as particularly important in making attitudes more positive. In modifying the status it affects the (perceived) prestige of a language. Therefore status is a key dimension of meaning within which attitudes toward a language can be measured. During the 20th century reversing the low prestige of languages was often done alongside their legal or constitutional recognition, particularly in countries where regime changes involved language inversion. Perceptions about the relative status of a language are strongly influenced by its value as a form of what Bourdieu (1991) refers to as "linguistic capital."

It thus follows that status-enhancing initiatives such as the inclusion of the language in key institutional domains including education, public administration, and the media have the potential to alter negative perceptions about the worth of a language. For example, following the demise of the Soviet Union, deliberate efforts were made in the newly independent states to influence the allocation of functions of the reinstated national languages across all domains, which helped reconsolidate their former status.

Corpus and acquisition planning can also be influential in altering language attitudes and beliefs. Cooper (1989, pp. 155–6) for instance points out that corpus planning efforts can strengthen speakers' dignity and self-worth. In minority language contexts, revitalizing the low-prestige variety of a spoken form and developing a standard which could allow for its use in formal domains from which it was previously absent shows that the language is capable of formal and literary expression. Similarly, acquisition planning goals designed to create the opportunity to learn a language, as well as incentives to learn it, can have a positive effect on language attitudes. Especially in the postcolonial context it can serve to answer functional concerns and lead to empowerment through viable literacy development.

Extending a focus on objectives and targets, goals, or "ends" (Cooper, 1989), and going beyond attitudes *per se*, Ager (2001) considered "motivation" in language policy and planning. He proposed that motivation consists of seven motives (identity, ideology, image, insecurity, inequality, integration, instrumentality) which function as attitudinal prompters of agents in their attempts to achieve specific goals. However, he stresses that motives are socially conditioned, are not always clear, nor openly stated or understandable, and that they also depend on changing attitudes and beliefs as embedded in the fundamental cultural values individuals hold (Ager, 2001, pp. 128–9). Therefore, since attitudes do not necessarily predict the strategies actors will implement, the functioning of both motivation and attitudes in language policy and planning processes is complex.

Naturally, ability of language policy and planning efforts to change language attitudes cannot be automatically assumed. This is not least, as Schiffman (1996, p. 119) notes, because implementation of such initiatives is almost always the weakest link in the policy and planning process, warning that while fiery rhetoric is one thing, carrying out the intention of the law is another. Moreover, seemingly well-intentioned language policy and planning initiatives can, rather than improve attitudes, actually have the opposite effect. Status planning, intending to enhance the symbolic value of a language, can sometimes be seen as antagonistic by members of the population and provoke negative attitudes toward the language as was the case for example under the ideological promotion of Kiswahili in Tanzania (see Blommaert, 2006). This can be salient if planning measures are seen to raise the status of certain groups within society and not others or if status measures are seen to provide advantage to some members of society but not to others.

In terms of corpus planning, Grenoble and Whaley (2006, pp. 154–6) argue that although standardization has undeniable benefits for minority languages in reversing language decline, the process can also facilitate continued language loss. Instead of strengthening speakers' dignity and self-worth, as Cooper (1989) suggests, standardization may in fact further stigmatize and isolate existing minority language speakers. In attempting to rid the minority language of influences from the dominant contact language, standardizers can promote policies which disempower vernacular forms of the language spoken in everyday contexts (Coulmas, 1989; Fishman, 2006; Woolard, 1998), as happened in the case of Galician.

The task of measuring the effects of language policy and planning initiatives on language attitudes is also made difficult by the fact that such initiatives do not exist in a social or cultural vacuum. Instead, they take place in particular sociolinguistic and sociocultural settings, and their nature and scope can only be fully understood in relation to these settings (Ferguson, 1977, p. 9). Language-related policies and planning measures are therefore

not autonomous processes (Ó Riagáin, 1997) but exist in an environment with physical, geographical, political, and socioeconomic components (Ager, 1996, p. 11). As Spolsky (2004, p. 8) notes, language and language policy both exist in highly complex, interacting and dynamic contexts, the modification of any part of which may have correlated effects (and causes) on any other part. It thus follows that a host of nonlinguistic factors (political, demographic, social, religious, cultural, psychological, bureaucratic) regularly account for any attempt by persons or groups to intervene in the language practices and the beliefs of others, and for subsequent changes to occur.

Schiffman (1996) notes that assumptions about languages and perceptions about their value are often deeply rooted in a society's linguistic culture which he defines as "the totality of ideas, values, beliefs, attitudes, prejudices, myths, religious strictures, and all the other cultural 'baggage' that speakers bring to their dealings with language from their culture" (2006, p. 112). Both language ideology and language policy are embedded in linguistic culture and hence fundamentally linked. For Spolsky, language ideology is "language policy with the manager left out," or "what people think should be done [with language]" (2004, p. 14). Hence changing value perceptions of languages do not depend exclusively, or even necessarily, on any official or legal status conferred by a state through its exclusive, legislative, or judicial branches.

Thus, ideologies about language generally and specific languages in particular delimit to a large extent what is and is not possible in the realm of language planning and policy making (Ricento, 2006, p. 9). It follows that, although policy and planning may be used to change attitudes toward a language or its speakers, existing language attitudes, ideologies, and beliefs can also be seen as a basis for policy and planning (Spolsky, 2004), as in the wholesale take-up of Hebrew in Israel. Reflecting the ideological views and orientations of a society, government, institutions, or individuals, a language policy, then, represents the whole political, social, and economic environment.

Blommaert (2006, p. 244) argues that language policy is invariably based on linguistic ideologies, on images of "societally desirable" forms of language usage and of the "ideal" linguistic landscape of society, in turn derived from larger (discursively constructed) socio-political ideologies. It is therefore possible to infer from language policy decisions or statements what the ideological orientation of a society is in relation to assumptions about a specific language or language in general. This relates to the fact, as Spolsky (2004, p. 14) points out, that the members of a speech community share a general set of beliefs about appropriate language practices, sometimes favoring a consensual ideology, assigning values and prestige to various aspects of language varieties used in it. It thus follows that we cannot assess the success of language policies or planning initiatives without reference to culture, belief systems, and attitudes about language which are deeply embedded within a society's structures (see Schiffman, 1996). We can, however, suggest that, as a (short-term) social construct of a given community, a language policy is prone to fail if it is not in consonance with the society's linguistic culture.

Language Awareness

JOSEP M. COTS

Since the early 1990s, “language awareness” has been a prominent notion in applied linguistics and, more specifically, in the field of language education. The interest in language awareness (LA henceforth) for those who deal with language at a professional level is proved by the fact that one can often find syntheses of what it involves in publications for readers with a general interest in language and applied linguistics, such as journals for language teachers (e.g., Carter, 2003) and comprehensive reference guides to key concepts, ideas or trends (e.g., Garrett, 2006). After the publication of Eric Hawkins’ (1984) work *Awareness of Language*, two of the factors that may have contributed to the “visibility” of the concept are the launch of the Association for Language Awareness and the publication of the journal *Language Awareness* in 1992. In this entry, I aim to show that a certain degree of familiarity with the principles and procedures of LA can help both language learners and language users in general to become more efficient and effective communicators. First, I will attempt to clarify the psychological implications underpinning the notion of language awareness by focusing on the characteristics of a mental state of “awareness,” as opposed to other possible states, and what this state implies in connection with language knowledge and skills. Next, I will describe how LA has become an issue in applied linguistics, especially in language teaching and learning. Finally, in the third part of this entry, the focus will move to the benefits of an increased and more sophisticated awareness of language.

Being Aware and Being Aware of Language

The notion of “awareness” is considered by applied linguists like Schmidt (1995) and van Lier (1996, 1998) as a level, phase, or facet of “consciousness,” a term defined by Chafe (1994, p. 28) as “an active focusing on a small part of the conscious being’s self-centered model of the surrounding world.” Schmidt (1995) deals with the role of consciousness in foreign-language learning by making a distinction among the processes of intention, attention, noticing, and understanding. He associates the notion of awareness with the last two. It seems that for Schmidt “the conscious registration of the occurrence of some event” (noticing) and the “recognition of a general principle, rule or pattern” (understanding) in which the event can fit imply a degree of “subjective experience” (p. 29), also implicit in Chafe’s idea of a “self-centered model of the surrounding world,” which is not necessarily present in the processes of intention and attention. This idea of awareness is clearly influenced by Jackendoff’s (1987) distinction between a “computational mind,” involving basic perceptual mechanisms in an information processing system, and a “phenomenological mind,” which is responsible for turning those perceptions into meaningful images for our experience.

Language use (or verbal communication) can be considered as an aspect of Chafe’s “self-centered model of the surrounding world” or, in the words of Schmidt, as part of an “event” which develops in accordance with “a general principle, rule or pattern.” This is the basis of Halliday’s (1978) theory of language, according to which it is one of the systems of signs constituting the social semiotic of a culture. For Halliday, language is a resource

to transform our experience of the world into meaning, and therefore the symbols and rules that we have consciously or unconsciously learned to apply when using it are the reflection of a particular sociocultural context. This view of language is important in order to fully understand van Lier's (1998) proposal of what may be involved in being aware of language. He proposes a hierarchical organization of levels of consciousness in the sense that each level presupposes the previous ones. The first and most basic level is "global or intransitive consciousness," which refers to the state of being generally alert to the verbal messages that may come from the environment. The second level, which he terms "awareness" (or "transitive consciousness"), refers to the capacity to notice or focus our perceptual activity on the structure, functions, or uses of specific linguistic elements; this is the level at which, for instance, one can notice a certain accent or a particular variation in the organization of a sentence. The third level, "metaconsciousness," includes (a) "practical awareness," the capacity to control, manipulate and be creative with language, and (b) discursive awareness, including the ability to discuss language in precise terms and engage in formal analysis; this is often the level of awareness which is the aim of formal education. Finally, and in line with Halliday's view of language as intrinsically connected to its sociocultural context, van Lier proposes a fourth level of consciousness, "critical awareness," which involves the capacity to consider language use as the result of and, at the same time, a tool for social and ideological practice; this is the level to which we refer when, for example, we want to avoid sexist language or to discover the intention behind a political or commercial message.

Language Awareness as an Issue in Language Learning and Use

The role of awareness (or consciousness) in language learning and use is not clear to everyone, and according to van Lier (1996, pp. 73–4), the debate has mainly focused on two positions which, in his opinion, are erroneous. The first position is based on the assumption that consciousness does not have a relevant role in language learning, either because there is no direct empirical evidence of how it works or because it is considered that language proficiency is the result of the gradual development of an innate capacity, which can only be triggered in specific situations of language use. The opposite position in the debate is that conscious understanding and learning of explicit knowledge about the rules of language is essential for the achievement of full proficiency in a language. For van Lier, these positions ignore the real functions of awareness, which are to organize, control, and evaluate the experience of communicating through language. Furthermore, learning conditions such as receptivity, participation, or investment and processes like focusing attention, comprehending, or memorizing depend on "the involvement of a conscious mind (in interaction with the environment) which is aware of what it is doing and what is going on" (p. 74).

A second issue related to language awareness was first raised by Long (1991) when he made a distinction between a "focus-on-formS" and a "focus-on-form" approach in second language teaching. The first approach involves presenting language as consisting of different structures which are isolated, pre-selected, and brought to the awareness of the learners by teaching them explicitly. In the second approach, linguistic code features are only brought to the attention of the learners when specific problems or needs of the learner surface in the course of a communicative activity. Within the "focus-on-form" approach, Doughty and Williams (1998, pp. 5–6) raise four more questions in the debate: (a) Should focus on form occur before, during, or after learners have developed their communicative ability? (b) Which forms are more likely to be the object of focus? (c) What factors need to be considered when deciding on the degree and nature of focus on form?

(d) Can specific learning tasks provide opportunities for the learner to focus on certain forms?

A third issue that may be mentioned in relation to the role of language awareness is whether it is more effective or influential for mother tongue or second language learning and use. On the one hand, it should be said that the beginning of the British language awareness movement in the late 1960s and early 70s coincided with a growing dissatisfaction with mother tongue teaching and, consequently, school results (Hawkins, 1984; James, 1999). On the other hand, a quick look at the research published in the journal *Language Awareness* shows that language awareness is a more prevalent topic in research on second language learning. However, one could argue that this debate is based on the misconception of considering native speakers as ideal users of their mother tongue, fully competent in the different registers, genres, and varieties. Since, as we all know, this is not true, one possible response to the issue could be to say that as long as both native and non-native speakers never stop learning new aspects of a language, there will always be communicative situations in which language users may benefit from increased language awareness to allow them to better control, organize, and evaluate verbal behavior. James (1999, pp. 102–3) adopts the position that language awareness is necessary for the development of both mother tongue and foreign language, and he makes a distinction between *language awareness* for “knowers and speakers” and *consciousness raising* “for learners, who are not yet in command of certain desirable knowledge, skills and intuitions.” Whereas in the first case the aim is “gaining explicit knowledge about and skill in reflecting on and talking about one’s own languages,” in the second case the aim is “to locate and identify the discrepancies between one’s present state of knowledge or control and a goal state of knowledge or control.”

The Benefits of Language Awareness

In this section I will reflect on the benefits that heightened language awareness may represent, not only for language learners and teachers, but also for users in general. Van Lier (1995, p. 1), points out the relevance of language as the main feature that makes humans unique in relation to other animals, and he suggests that “there may be important reasons for bringing aspects of language into focal awareness, in order to solve problems, reach higher levels of skills in some particular areas, or to think more critically and independently about important issues” (p. 6). Twelve years after van Lier published his work, Svalberg (2007, p. 288) seems to be of the same opinion about the relevance of language awareness: “The concerns which initially gave rise to the LA [Language Awareness] movement are not only still with us but are perhaps of even greater salience due to social and economic developments such as migration, globalization, international trade and international conflict.”

One way of approaching the benefits of an individual’s increased language awareness is to consider the “domains of competence and understanding” that, following James and Garrett (1992), may be affected: affective, social, power, cognitive, and performance. From an affective point of view, it seems that a better understanding of how language and communication works contributes to developing greater empathy and curiosity toward language learning. The social domain refers mainly to fostering tolerance in multilingual and multicultural contexts by emphasizing the structural and historical development of different languages as well as the advantages of multilingualism. The emancipation of the individual from oppression and manipulation through language use is the most salient aspect of the power domain; this is achieved by letting people know about the hidden meanings and intentions behind specific choices involving different aspects of language

(e.g., lexical, syntactic, register, dialect, or even language). The main assumption in the cognitive domain is that developing language awareness involves a simultaneous development of general cognitive skills including perception of pattern and contrast, rule derivation, generalization, inference, and form–function relationships. Finally, in the performance domain, the assumption is that noticing features of language and explicit learning contribute to effectively improving language proficiency.

The target learner or user profile which results from heightened language awareness is one in which the individual is cognitively, affectively, and socially engaged with language. These three attributes of engagement are clearly defined by Svalberg (2009). When learners or users are cognitively engaged, they pay focused attention to input and look for rules or principles that can explain the way speakers use the language. Affective engagement basically involves a willful, purposeful, and autonomous disposition to observe and experiment with language. Finally, a socially engaged learner relies on interaction with others as a means for learning and to accomplish the other two types of engagement.

After sketching a target learner or user profile resulting from increased language awareness it seems necessary to explore the kind of teaching profile that might best contribute to reaching the target. A language awareness approach, as Carter (2003) defines it, can be characterized as favoring inductive, collaborative and reflective teaching activities. The learners' participation in these activities starts from their intuition and the teacher only provides the necessary scaffolding for them to focus their attention on certain aspects and acquire for themselves the knowledge and skills required to accomplish a task. This task must be as authentic as possible, in the sense of being close to the needs and interests of the learners. Language awareness can be considered as a link between two areas of professional knowledge for language teachers: (a) subject matter knowledge (i.e., general and descriptive linguistics), to fully understand how the language functions; (b) pedagogical content knowledge, to effectively represent the functioning of the language to learners according to their needs and capacities. Andrews and McNeill (2005) suggest the following characteristics of teacher language-aware behavior: (a) willingness and ability to engage with language-related issues in the classroom, which constitute the centre of their teaching practices, and to reflect about the content of learning in their classes; (b) awareness of the limitation of their own subject matter knowledge together with a desire to improve it; and (c) a classroom practice of input enhancement to make salient the particular features of the language structure they aim to teach.

If one believes that education never stops and that the main goal of education may be for individuals to be able to be critical and emancipate themselves from socially dominant forces that have the power to control all kinds of social practices, then we can say that the development of critical language awareness should be of interest to citizens in general. This is probably the sense in which Svalberg (2007, p. 288) wonders whether one of the possible "advantages" of an increased language awareness is "to improve our relations with other people and/or cultures, and in our ability to see through language that manipulates or discriminates." Most citizens, in the course of their daily lives, are subjected to a myriad of spoken or written messages addressed to them with the aim of influencing their view of the world and, ultimately, their social behavior. The development of critical language awareness skills involves the capacity to read or listen to a text while analyzing it from two points of view: (a) the underlying social goals, attitudes, and roles associated with specific ways of using the language and (b) the processes through which these particular goals, attitudes and assumptions have become naturalized and, therefore, more acceptable than others.

The growing multilingualism and multiculturalism that characterize many of our societies represent another area of social interest that may benefit from a general increase in the

language awareness of individuals. In this sense, the project EVLANG (*Éveil aux langues*, 1998–2001) (Candelier, 2004) is a good example of how primary-school children can be helped toward awareness of the diversity and legitimacy of the languages and cultures of all the pupils, while developing general metalinguistic knowledge and transferable skills that should be useful to them in learning languages. The connection between multilingualism and awareness is made clear by the Language Policy Division of the Council of Europe (Council of Europe, *n.d.*) with the inclusion of the term “awareness” in two of the six goals of multilingual (or plurilingual, as the Council of Europe refers to it) education: (a) an awareness of why and how one learns the languages one has chosen; (b) an awareness of and the ability to use transferable skills in language learning. If multilingualism is the rule rather than the exception and, following authors like Jessner (2007), multilinguals develop metalinguistic skills and capacities that are not found in monolinguals, language-aware citizens and professionals may not only be more tolerant of linguistic and cultural diversity but also more critical toward monolingual models of competence which define multilingualism as the achievement of the same level of proficiency in different languages, instead of as a unique repertoire involving different levels of proficiency in different languages according to the needs of the individual’s daily life.

The role of language awareness in intercultural communication is made explicit in Byram’s (1997) model of intercultural communicative competence, in which, besides specific sets of knowledge and skills, he includes “an attitude of curiosity and openness” (p. 57) and “an ability to evaluate, critically, and on the basis of explicit criteria” documents and events in one’s own and other cultures (p. 63). Terms such as curiosity and critical evaluation have an inevitable resonance with the social and power domains of language awareness proposed by James and Garrett (1992), but also with ideas which have been introduced above in relation to the profile of the language-aware learner or to the development of critical language awareness. Bremer, Roberts, Vasseur, Simonnot, and Broeder (1996) show the relevance of raising awareness of institutional intercultural communication, especially among the members of the majority community, who tend to be the gatekeepers for the social and economic promotion of the members of the minority community.

To conclude, the capacity to observe, organize, monitor, and evaluate one’s own and other people’s language use, which is defined here as “language awareness,” involves cognitive, affective, and social or interactional processes. Research and applications focusing on this capacity can be said to have moved in basically two directions. The dominant direction is that of considering it as the basis for an approach to increase the efficiency and effectiveness of the processes of language teaching and learning. The second, perhaps less researched, direction is to see language awareness as a resource for the improvement of social relations and the emancipation of individuals and social groups. It may well be that in a progressively multilingual and intercultural 21st century there will be a greater need to concentrate more effort on resolving the political and social conflicts that will inevitably arise from a world which becomes smaller every day and requires us to share more of ourselves with “the other.”

Language Endangerment

SUZANNE ROMAINE

Over the past few decades linguists have become increasingly concerned about the problem of endangered languages (Robins & Uhlenbeck, 1991; Krauss, 1992; Crystal, 2000; Nettle & Romaine, 2000; Gibbs, 2002; Abley, 2003, Dalby, 2003). According to some estimates, as many as 60% to 90% of the world's 6,900 languages may be at risk of extinction within the next 100 years. This does not include dialects because no one knows exactly how many languages and dialects there are and there are no clear criteria for defining the boundaries between languages and dialects (see Wolfram & Schilling-Estes, 1998 for discussion of dialect endangerment). Most assessments rely on the Ethnologue data compiled by the Summer Institute of Linguistics, cataloging all the known languages of the world; in practice, this includes a total of 6,909 languages spoken by 5.9 billion people (Lewis, 2009).

How Languages Become Endangered

More is known about how and why languages become endangered than about preserving and maintaining them. For most of the many millennia of human history, human communities were small and it seems likely that the world was close to linguistic equilibrium, that is to say, the number of languages lost roughly equaled the new ones created. The reason why this balance persisted for so long is that there were no massive, enduring differences between the expansionary potential of different peoples of the kind that might cause the spread of a single, dominant language. Over the past 10,000 years, however, various events have punctured this equilibrium forever. First, the invention and spread of agriculture, the rise of colonialism, later the Industrial Revolution, and today the spread of mass media, globalization of economies, and so on have created the global village phenomenon. These forces have propelled a few languages—all Eurasian in origin—to spread over the last few centuries. Now all but a handful of hunter-gatherer societies live outside their local ecosystems. The spread of large languages in modern times has rendered the global distribution of linguistic diversity strikingly uneven and resulted in marked disparities in the size of populations speaking the world's languages. If all languages were equal in size, they would have around 860,000 speakers. According to the Ethnologue, however, 389 (or nearly 6%) of the world's languages have at least one million speakers and account for 94% of the world's population. The remaining 94% are spoken by only 6% of the world's people (Lewis, 2009). Over 80% of the world's languages are found in just 20 countries, including some of the richest in the world (USA, Canada, and Australia) as well as some of the poorest (Chad, Democratic Republic of the Congo, and Nigeria).

Figure 1 shows that only nine languages have more than 100 million speakers; altogether they are spoken by about 50% of the population. These include Chinese (1.23 billion speakers), Spanish (329 million), English (328 million), Arabic (221 million), Hindi (182 million), Bengali (181 million), Portuguese (178 million), Russian (144 million), and Japanese (122 million). These very large languages are all spoken in more than one country. English, for instance, has large groups of speakers in the UK, USA, New Zealand, Canada, Australia, and South Africa. The spread of these languages would be even more extensive if figures

2 LANGUAGE ENDANGERMENT

Figure 1 Languages with 100+ million speakers as a percentage of world population (based on data from Lewis, 2009).

for second language speakers are included. Although English is not the largest language in the world, it is one of a small handful of what may be called global languages in terms of geographic spread and number of users worldwide. With estimates of the number of non-native speakers of English ranging from 470 million to more than a billion, non-native users greatly outnumber native speakers.

As large language communities expand, others contract. Over the last 500 years, small languages nearly everywhere have come under intense threat. Language shift and death are responses to pressures of various kinds on communities. People do not normally give up their languages or cultures willingly, but continue to transmit them, albeit in changed form, over time. The disappearance of a language and its related culture almost always forms part of a wider process of social, cultural, and political displacement. Not coincidentally, the vast majority of today's threatened languages and cultures are found among socially and politically marginalized and/or subordinated national and ethnic minority groups. Communities can thrive and transmit their languages only where their members have a decent environment to live in and a sustainable economic system. In a rapidly globalizing world with a handful of very large languages and many thousands of small ones, maintenance of linguistic diversity is inextricably linked to the survival of small communities, whose subsistence lifestyles depend on healthy ecosystems and access to land. Without such resources these groups find it hard to maintain their ways of life and their cultural identities on which the continued transmission and vitality of their languages depend.

Signs of Endangerment

Estimates of the number of languages in danger of extinction vary depending on the criteria used to assess risk. More research is needed in order to understand the role of various factors such as size (i.e., number of speakers), status, function, and so on in supporting or not supporting languages. There is still no system of language ranking in terms of risk (Krauss, 2007). Languages are most obviously at risk when they are no longer transmitted naturally to children in the home by parents or other caretakers. UNESCO (2001) suggests that languages being learned by fewer than 30% of the younger generation may be at risk, yet there is very little information about the number of languages no longer being transmitted. No children are learning any of the nearly 100 native languages in what is now the US state of California. Statistics from several parts of the world, such as Canada (see, e.g., Norris & Jantzen's 2002 work on assessing the continuity of aboriginal languages using census statistics, and the Task Force on Aboriginal Languages and Cultures, 2005) and Australia (McConvell & Thieberger, 2001), as well as reports from fieldworkers on the ground, are quite alarming. In Canada perhaps only three languages out of around 50 (Cree, Atikamek, and Inuktitut) are viable in the long term. The Australian continent is a linguistic graveyard, with 90% of Aboriginal languages near extinction. From 1800 to 1996 there has been a decrease of 90% in the number of indigenous languages spoken fluently and regularly by all age groups as well as a decrease in the percentage of people speaking an Aboriginal language from 100% to 13% (McConvell & Thieberger, 2001). Only some 50 languages are widely spoken today; of these only 18 have at least 500 speakers. These 18 account for roughly 25,000 of the remaining 30,000 speakers of Aboriginal languages today. Most aboriginal languages in Canada, the USA, and Australia cannot draw on official support or rely on institutions such as the school to produce new users.

Another sign of impending shift appears when a language once used throughout a community for everything becomes restricted in use as another language intrudes on its territory. Usage declines in domains where the language was once secure, such as in churches, the workplace, schools, and most importantly the home, as growing numbers of parents fail to transmit the language to their children. Fluency in the language increases with age, as younger generations prefer to speak another (usually the dominant societal) language. In California none of the remaining indigenous languages is spoken natively by anyone under the age of 60 and only five have more than about 10 speakers.

The functions a language is used for may also tell us something about its long-term viability. Fewer than 4% of the world's languages have any kind of official status in the countries where they are spoken. A small minority of dominant languages prevail as languages of government and education. English is the dominant, *de facto*, or official language in more than 90 countries. The fact that most languages are unwritten, not recognized officially, restricted to local community and home functions, and spoken by very small groups of people reflects the balance of power in the global linguistic marketplace. No Aboriginal Australian language is used in all spheres of everyday life by members of a sizeable community. Insofar as status offers a degree of protection against endangerment, the only languages that may be considered safe are the politically dominant languages of modern nation-states (Romaine, 2007).

Many researchers use size as a proxy for degree of endangerment to assess risk, both globally and in specific regions. Krauss (1992), for instance, believes that only the 600 or so languages with the largest numbers of speakers (i.e., more than 100,000) may survive. If this is true, few of the 6,000 or so remaining languages will have a secure future. Even if the viability threshold is set at the lower level of 10,000 speakers, 60% of all languages are already endangered. Although size does not tell the whole story, it may be the best surrogate for vulnerability to the kinds of pressures leading to language loss. Small

languages can disappear much faster than large ones, and forces have been unleashed in the world that small communities find difficult to resist. The developed nations of the world are now rapidly destroying the habitats sustaining much of the world's biological and linguistic diversity. Resource extraction, the spread of mechanized agriculture, and development projects damage the environment at the same time as they displace and marginalize people from places they traditionally relied on for their food, shelter, cultural practices, and spiritual well-being. Since 1900, 90 of Brazil's 270 Indian tribes have completely disappeared. More than two-thirds of the remaining ones have fewer than 1,000 members (Hemming, 1978). Moreover, a high degree of endemism (i.e., native to a particular area and not found elsewhere) amongst languages with small numbers of speakers means that the risk to rare and unique languages is greater than the risk to more common ones. If some horrific catastrophe wiped out all the languages of Western Europe tomorrow, we would lose relatively little of the world's linguistic diversity. Europe has only about 3% of the world's languages, and most of the largest European languages are also widely spoken outside Europe. More importantly, however, most of the languages of Europe are structurally quite similar, because they are related historically. If we were to lose the same number of languages in Papua New Guinea or South America, the loss would be far more significant, because the divergence between languages there runs much deeper (Nettle & Romaine, 2000, pp. 33–9, 62–7). Papua New Guinea alone contains 11.9% of the world's languages, but only 0.1% of the world's population and 0.4% of the world's land area.

What Is Lost When Languages Are Endangered

The crucial role language plays in the acquisition, accumulation, maintenance, and transmission of human knowledge means that the prospect of language extinction on such a large scale raises critical issues about the survival of humanity's rich and diverse intellectual heritage. Most endangered languages are unwritten and undocumented and there is still very little research on most of the world's languages. Linguists have tended to work on the familiar and easily accessible languages spoken by large numbers of people. While thousands of linguists have probably worked on French or English over the last 100 years or so, there are thousands of other languages which have received little attention, and thousands still that have received none at all. *The Ethnologue* singles out more than 3,000 languages in need of surveys. Estimates of the costs of providing adequate documentation range from around \$55,000 per language to fund two years of work by a linguist to provide a basic dictionary and grammar to \$2 million per language to fund an in-depth study over 15 years, complete with audiovisual archive, and so on. Crystal (2000, Chapter 4) proposes a figure of \$585 million (\$65,000 per year for three years' work to provide basic documentation for 3,000 languages). Even if sufficient money were available for documentation, there is a shortage of trained people able and willing to do the work. There are considerable political and logistical impediments in getting to areas where the most endangered languages are spoken.

The problem of language endangerment raises critical issues about the survival of knowledge that may be of use in the conservation of the world's ecosystems. The 49 members of the Great Andanamese tribe, the last survivors of the pre-Neolithic population of Southeast Asia, face a serious threat of extinction, but all survived the huge tsunami unscathed after it hit the Indian Ocean and Bay of Bengal in December 2004 because they knew exactly which trees would not be swept away (Abbi, 2006). Folk traditions and other forms of knowledge passed down orally for generations are always only a generation away from extinction. The traditional inhabitants of Marovo Lagoon (Solomon Islands), for instance, have names for at least 500 plants, 70 birds, 350 fish, 100 marine shells, some

50 distinct terms for forest types, land topography, and freshwater systems, and more than 70 terms for reef types and underwater and coastal topography (Hviding, 2006, p. 79). The disappearance of hundreds of species of fish, birds, and other life forms, along with their names and related knowledge of their habitat and behavior, represents an enormous loss to science at precisely the time when we most urgently need to manage local ecosystems more effectively. Loss of linguistic diversity also threatens the scientific study of language by diminishing the range of structures for constructing hypotheses about the nature of the human mind.

What Can Be Done?

The prospect of the loss of linguistic diversity on such a large scale has prompted both communities and scholars to propose programs of intervention to preserve and revitalize languages (see Hinton & Hale, 2001; Grenoble & Whaley, 2006, chap. 3, for examples). Because typically much needs to be done quickly with too few resources, setting realistic priorities is paramount. There is no one-size-fits-all solution for revitalization and preservation. The immediate one is to identify and stabilize languages under threat so that they can be transmitted to the next generation in as many of their functions as possible. This means assessing which functions are crucial to intergenerational transmission and have a reasonable chance of successful revival and continuation. Every group must decide what can best be done realistically with the resources available for a particular language at a particular time.

Communities around the world have increasingly looked to schools and other teaching programs as a way to revitalize their languages. Immersion models of various types are being implemented to promote indigenous and minority languages. Some programs are total immersion, such as the Hawaiian and Blackfoot ones, modeled on the Māori “language nest” called Te Kōhanga Reo, while others may be partial. In Hawaiian immersion schools Hawaiian is used across the curriculum from pre-school onwards, and English is introduced as a subject from the 5th grade (around age 10) for one hour a day. Most of the students attending are English speakers and are learning Hawaiian as a second language. The language nest/immersion model contrasts with more conventional language teaching where the language is taught as a subject for a limited number of hours with fewer opportunities for high levels of academic or informal engagement with the language in use. In immersion there may be little, if any, focus on language learning *per se* in the form of direct teaching of grammar and vocabulary. Language is acquired through the meaningful interaction required to learn academic content in various subjects. Other variants of the model may rely on bilingual immersion combined with a third language taught as a subject. In parts of the Basque country Basque and Spanish are used for instruction during primary education, and English is taught as a subject beginning in kindergarten. The Kahnawake Survival School in Quebec, dedicated to preserving Mohawk language, culture, and history, combines total and partial immersion at various levels.

Successful immersion programs obviously depend on the availability of fluent teachers and teaching materials, and are therefore less easily implemented when a language has only a handful of speakers. In California and elsewhere in the USA, native North America learners have benefited from a Master–Apprentice program, which brings together a fluent elder and a learner, who use the language for everyday activities (Hinton, 2002). A variant of this program brings together elders and learners of various ages in immersion camps for several days or longer, often during the summer, to engage in cultural activities in which native languages are used to varying extents. Where transmission has ceased altogether or been interrupted for a long period, prospects for revitalization rely on documentation, reconstruction, or both to “reclaim” what some have called “sleeping languages.”

One example is the Kurna language once used by Aboriginal people in what is now the area of Adelaide in South Australia. Although it has not been spoken for more than a century, some people are now using the language for limited activities such as greetings, songs, and naming activities (Amery, 2001).

While salvage operations aimed at recording a language for preservation in books are worthwhile endeavors, and may be all that can be accomplished for some severely eroded languages, they do not address the root causes of language decline and without further action they do not contribute substantially to language maintenance efforts in the long term. The preservation of a language in its fullest sense ultimately entails the maintenance of the group of people who speak it, and therefore the arguments in favor of doing something to reverse language death are ultimately about preserving cultures and habitats. Languages can only exist where there is a community to speak and transmit them. A community can exist only where there is a viable environment for them to live in and a means of making a living. Where communities cannot thrive, their languages are in danger. When languages lose their speakers, they die.

Language Evolution: Pidgins and Creoles

HUBERT DEVONISH

What Happens When Language Meets Language?

Language evolution is the focus of the field of historical linguistics. It is laden, some might say blighted, with biological metaphor. The same is true for the pidgin and creole linguistics which has followed in the wake of historical linguistics and adopted its metaphors. One particular focus of pidgin and creole linguistics is to understand how pidgin and creole languages came into being. For us to follow the proposals made in this area, we have to follow the chain of metaphor. We do this in the present survey while maintaining a critical awareness of the difference between metaphor and linguistic reality.

The term “language evolution” begins the string of biological metaphors. It suggests that languages, like life on earth, had a single common origin, and then diversified and became more complex through some selection process. These two stages can be termed “language birth” and “language change.” In pidgins and creoles, the two processes meet. Several languages already in existence come into contact with each other, and a new language that did not previously exist comes into being.

When people meet who do not have a common language, there is still need for language communication. One option is for speakers in this context to devise a *pidgin*. This is a simplified language used for restricted functions by adults who find themselves needing to communicate regularly with others who do not speak the same language. The lexicon of the pidgin originates, for the most part, in one of the languages of the contact situation, referred to as the superstrate language or more neutrally as the lexifier language. The grammatical structure is posited to come from a range of languages in the contact situation as well as from processes of regularization and simplification under the influence of language universals. The phonological systems, though not playing a prominent role in some of the theories of origin, can be proposed to come from an interaction between the phonological systems of the substrate languages and the superstrate.

There is then the issue of what happens to this pidgin if children are born into communities where it is the main medium of communication. Such a language might become the first language of this new generation. If so, we would be dealing with the process of the creolization of a pidgin language and its emergence as a full and complex native language, a *creole*. What then are the processes involved in the development of a full, complex language from a relatively simple and rudimentary pidgin language?

The etymology of the word “creole” is based on the notion that these languages are original creations. The dictionary entry in Allsopp (1996, p. 176) for “creole” suggests that it is originally from Portuguese *criar* ‘to create’. This etymology lies at the heart of the discussion among scholars as to what constitutes creole languages. Is that which is created simply new in the sense that it is a new mix of already existing components and, if so, which components coming from where? Or is this creation something which is totally new? Linked to this is the dispute which exists even in orthodox historical linguistics over what constitute the identifying, that is, “genetic” characteristics of languages. We need to be aware of this lack of unanimity among scholars working in the field in order to understand the differences in the approaches which they adopt.

Figure 1 Single-parent model of language evolution

Uninterrupted Superstrate Transmission?

The standard approach to explaining how new languages develop is the comparative method first developed with the reconstruction of the Indo-European language family. This method presumes relationships of the type shown in Figure 1.

This model presumes that language C was a single language in existence at some prior point in history. Its speakers become separated as a result of migration or other such factor, and the two versions of language C develop separately and in different ways. The outcome, after several centuries or millennia, is the emergence of languages A and B. They show some features of similarity, all of which can be traced back to an original C. There are, in addition, however, the features which mark A off from B. These are the features which have developed in A, B, or both as a result of natural language change since the two sets of speakers separated. These new features would be, by definition, features not inherited from C. This is the typical model used to explain the evolution of Latin, language C, into the modern Romance languages such as French, Spanish, Portuguese, Italian, and Romanian (Meillet, 1936). This may be described as the single-parent model.

The single-parent model has been adopted in reconstructions of the origins of creole languages. Mufwene (2001) is one of the more detailed elaborations of this approach. Typically, creole languages emerge in a situation where there is a socially dominant language in contact with one or more socially subordinate languages. The socially dominant language, the *superstrate*, usually contributes the bulk of the vocabulary of the newly emerging language, functioning as the *lexifier*. Mufwene (2001) argues that creole languages are continuations of features of the superstrate languages. This proposal requires an explanation to be provided for the marked differences between the creole language and its superstrate lexifier. Mufwene proposes that the superstrate language manifests itself in the language contact situation in the form of a gene pool. A range of sometimes quite deviant dialects of the superstrate language are in use in the contact situation. The linguistic features associated with these diverse dialects represent a linguistic gene pool from which the emerging creole is derived. What gets selected from this gene pool and what gets rejected are determined by principles which include (a) a preference for those competing genetic characteristics which correspond most closely to that which is favored cross-linguistically, and (b) a favoring of those competing genetic features which correspond most closely to one or more of the subordinate languages in the contact situation (Mufwene, 2001, pp. 54–60).

At the heart of the Mufwene position is the claim that the social context within which creole languages develop involves, in the earliest phases, the speakers of the substrate languages having easy access to language models provided by users of the superstrate

language (Mufwene, 2001, pp. 54–61). Natural adult language learning can and does take place. The creole outcome is the result of a unique combination of features from the pan-dialectal feature pool for the superstrate language present in the contact situation. No pre-existing dialect of the superstrate would have had this particular combination of features. What we have here, in Mufwene's terms, is uninterrupted language transmission. The creole language is genetically related to the superstrate language.

Mufwene's model does seek to account for creole languages which are particularly deviant from their superstrates. He argues that in some situations, after the formation of the creole, there is an influx of large numbers of new arrivals speaking substrate languages. These languages may come to have an influence on the already existing creole language, making it more deviant from the superstrate language than it otherwise might have been (Mufwene, 2001, pp. 50–5). The Mufwene version of the single-parent origin approach might be dubbed the superstrate preservation hypothesis.

Uninterrupted Substrate Transmission?

As would be expected, there is a converse view that sees creole languages as continuations of the socially subordinate substrate languages. According to Alleyne (1980, p. 33), Atlantic English-lexicon creole languages, the subject of his study, represent the continuation of a set of shared features underlying the West African Niger–Congo substrate languages. As he argues, “we are perhaps dealing with several languages (West African Niger–Congo) which had a number of phonological, syntactic and lexical isoglosses in common” (Alleyne, 1980, p. 223). Unlike Mufwene (2001), Alleyne is not dealing here with divergent dialects of a single language such as English or French. He, instead, is referring to languages which are quite disparate, and belonging to distinct subgroups of Niger–Congo languages spoken in West Africa, notably those such as Mande, Kwa, and Bantu. The argument for substrate transmission, has, therefore, by definition, to be more abstract than that for superstrate transmission. Among the underlying substrate features which Alleyne (1980, pp. 136–79) proposes for Atlantic English-lexicon creoles is a preference for open, consonant–vowel (CV) syllable structures; the morphological process of reduplication to produce a distributive meaning; and the use of preverbal markers in the sequence Tense + Aspect.

The substrate preservation approach accommodates the influence of the superstrate by proposing that there is an ongoing process of linguistic acculturation which stretches out over time. It causes the substrate influences to be replaced gradually by those of the superstrate. For Alleyne (1980), unlike Mufwene (2001), this is not a founding influence but one which infiltrates the language over the entire period of its contact with the superstrate language.

There is a solid body of scholarly work arguing for this position. The specific focus has been the influence of the Ewe–Gbe–Fon language cluster, within the Kwa language group, on Atlantic creoles, particularly French-lexicon creoles. This tradition begins with Sylvain (1936), who argues that Haitian Creole is essentially Ewe syntax with French vocabulary. This perspective is adopted and explored in greater depth and with the benefit of more detailed contemporary descriptions of the Gbe–Fon languages/dialects in Lefebvre (1999).

Are Pidgins Born and Do They Grow Up to Be Creoles?

The superstrate and substrate preservation hypotheses were articulated in opposition to the classic position in the field of pidgin and creole studies, that pidgins develop into creoles. According to Hall (1966), when speakers of more than one language come into extended contact and do not have a language in common, a pidgin is produced. If the

contact between the language groups is protracted, this pidgin stabilizes. If children are born into a situation where a pidgin is the language most widely used around them, they acquire it as a native language. In this situation, for the adult users of the pidgin, the language is only a second language with restricted usage and limited communicative functions. For the new generation, this language is the one required for all communicative functions.

In its new role as native language, the resources of the pidgin, lexical as well as syntactic, are expanded by the new generation to allow the language to perform its new extended roles. This marks the genesis of a creole. According to this approach, however, in spite of its elaboration and expansion beyond the pidgin, the creole still carries within it features inherited from the pidgin. Some of these features are inherited, in turn, from the original languages, both superstrate and substrate, that were part of the initial contact situation. Others are a product of the linguistic universals which played a role in the process which created the original pidgin. The pidgin-creole hypothesis does accommodate the prospect of the inheritance of both superstrate and substrate features by the creole language.

Are Creoles Made Up From Scratch?

All of the preceding approaches are contradicted by the Bickerton language bioprogram hypothesis (LBH). The LBH position taken in Bickerton (1981) is that creole languages, though arising in situations where there is a pre-existing pidgin, do not have as an input such a pidgin. For Bickerton (1981, pp. 4–5), the pidgin which develops in language contact situations is basic and elementary, variable and idiosyncratic. As a consequence, it fails to constitute an appropriate language input for children born into a situation where a pidgin is the ambient language. The innate predisposition that all children have to learn the language(s) which are used in the environment fails to regard the input from a pidgin as adequate for language acquisition. Children in such situations resort to their innate, biologically programmed knowledge of linguistic universals to construct a “real” language out of the inadequate input which they receive. The resulting language which they construct corresponds very closely, syntactically, to those features which are prototypical among the languages of the world.

The LBH proposal, that children reinvent human language by resorting to prototype syntactic language features to produce a creole, leaves no room for the inheritance of superstrate or substrate language features. The creole language which emerges, according to the LBH, has syntactic features which have been developed from scratch. Scratch here is the language bioprogram which all children have, which predisposes them to learn language and, according to Bickerton (1981, pp. 132–5), to invent one where none, or at least no full language, exists in the environment. It is worth noting, in all this, however, that the LBH is narrowly about the reinvention of *syntax* in a historically pidgin situation.

All of the Above?

McWhorter (2005) is a proponent of what might be referred to as the eclectic option. This approach accepts that some features of creole languages are a result of transmission from the substrate. Thus, in the case of Atlantic English-lexicon creole languages, serial verbs, a relatively rare phenomenon in the languages of the world, occur in patterns which are clearly linked to their putative substrates among the Kwa languages of West Africa (McWhorter, 1997, pp. 30–5).

McWhorter accepts that superstrate influence is also evident in these languages. Thus, for example, he argues for an Irish English source for a particular widespread feature in

Atlantic English-lexicon creoles. This involves the use of the word *self* to signal the adverbial meaning 'even' (McWhorter, 2005, pp. 220–3).

In addition, internal innovation, McWhorter proposes, can be seen. These creoles have the form *da* as equational copula and as the demonstrative pronoun *that* (McWhorter, 2005, pp. 204–5). Neither the superstrate nor the substrate languages show any such homophony. However, crosslinguistically, it is known in languages for the copula to have the same form as a demonstrative, usually a proximal demonstrative, namely *this*, and that the copula is historically a grammaticalized form of the demonstrative. McWhorter presents evidence from the early attestations of Atlantic English-lexicon creoles to establish that this was indeed an innovation and was not a feature which existed from the very beginning of these creoles.

Most significantly, McWhorter is also willing to accommodate to the notion of influence from language universals or the language bioprogram, triggered by the conditions in which creole languages developed. The simplification associated with the precursor pidgin, or the linguistic universals of the bioprogram resorted to by first generation creole-speaking children, or both, contribute as well to the emerging creole (McWhorter, 2005, p. 100). The simplicity of creole languages, he suggests, is a result of their recent formation. They lack, for him, the complexity of older languages which have an accretion of archaic features which are overspecified when compared with the requirements of universal grammar, the basic grammatical system which underlies all human languages (p. 66). For McWhorter (2005, p. 38), "The world's simplest grammars are creole grammars."

The Two/Multi-Parent Hypothesis: A Conclusion?

The task of reconstructing the origins of pidgin and creole languages falls to historical linguistics as much as it does to pidgin and creole linguistics. The latter subfield has tended to borrow its biological metaphors from the former. Thomason (2008, p. 249), giving a historical linguist's take on creole language genesis, points to the role which adults play in language change and questions the assumption common in pidgin and creole linguistics that the innovations in creoles were necessarily the product of children. She asserts the continued use of the caregivers' native languages in the linguistic environment where first generation creole-speaking children would have first appeared, a fact largely ignored in the LBH approach (Thomason, 2008, p. 251). The use of such native languages by adults, she argues, constitutes an important input into the emerging native language of the new, creole-speaking generation. Inevitably, therefore, for her, there is substrate carryover into the creole language which emerges.

Thomason (2008, pp. 252–3) first comments, from an orthodox position within historical linguistics, on the issue of the two possible types of language change that can occur in contact situations. There is language change induced by contact, involving borrowing, and there is language shift induced by interference from the native language. In borrowing, she argues, the first features which a speaker takes from other languages are lexical items. Only later does the grammatical structure come to be affected. In the case of shift induced by interference, as an adult speaker learns a new language, it is phonology and structure that are carried over from the first or native language rather than lexicon. She suggests that creolization is more consistent with language interference. This directly contradicts Alleyne (1980), for whom the creole which emerges is merely a relexified form of the substrate languages, with the original lexicon of West African Niger–Congo languages replaced by that of the superstrate European language. The difference between Thomason (2008, p. 251) and Alleyne (1980) is that the former defines borrowing narrowly as involving bilinguals or multilinguals. These, according to Thomason, usually borrow features

from one of the non-native languages for incorporation into the native language. This state of affairs is not considered typical of pidgin and creole formation situations.

In reality, the models of borrowing and interference only provide a basis for identifying genetic relations for creole languages if a very narrow definition of borrowing is applied. Borrowing, more broadly defined, or shift induced by interference can produce the same result: a language with the bulk of the lexicon from the superstrate language and a large number of features from the substrate languages. Thomason (2008, pp. 244, 255–7) resolves this dilemma through her proposal that creole languages are mixed languages which have emerged in relatively unusual social conditions. For her, mixed languages by definition defy the single-parent model. They fail to inherit from a single parent language all its main components, that is, lexicon, phonology, and morphosyntactic structure. She notes that pidgins and creoles take the bulk of their lexicon from the superstrate languages and their structures from the substrate languages in the contact situation (p. 257). These languages share the genetic features of two or more parents. In making her proposal, she can accommodate the insights developed from proposals for superstrate preservation (Mufwene, 2001), substrate preservation (Alleyne, 1980), the pidgin–creole hypothesis (Hall, 1966), and the eclectic approach (McWhorter, 2005). Her proposal, however, firmly rejects those coming via the LBH, which is ultimately a “no-parent” hypothesis.

Language for Specific Purposes in Asia

BUDSABA KANOKSILAPATHAM

Introduction

Asia, the largest of all continents, consists of over forty countries. It is a continent with diverse physical features as well as economic, political, and cultural characteristics. Despite such diversity, five languages are most commonly taught for “specific purposes” because of their political, economic, religious, educational importance, or any combination of these, including English, Japanese, Chinese, Korean, and Arabic. These five languages will be described from the perspectives of their historical development for instruction in the region; the “specific purposes” commonly addressed in language instruction; the scope, methods, and contexts of LSP instruction in Asia; and finally the distinctive features of LSP in Asia.

Historical Development of LSPs for Instruction in Asia

English has long played a dominant role in Asia (Canagarajah, 1996). The widespread use of English is largely attributed to the power of the former British Empire, as reflected in the continued use of the language in the Commonwealth nation members and in other parts of Asia including India, Singapore, Hong Kong, and Malaysia (Evans, 2010). The role of English as an LSP has become well established since the end of World War II, to a large extent because of the growth of technology and commerce dominated by English-speaking countries. As Asian nations have attempted to industrialize and modernize their societies, students have been encouraged to get their education abroad, particularly in English-speaking countries. The result has been an increased demand for ESP and EAP instructions in Asian countries. Returning graduates of educational programs from English-speaking countries have also helped to encourage the demand and interest in English (Tickoo, 1988).

Economically, Asia’s major imports are manufactured products from North America, Australia, and Europe. The increasing demand for rapid and massive expansion of international business also contributes to the growth of English as a language for occupational purposes. With new emergent economic powers including India, Malaysia, and United Arab Emirates, there is an increased demand for individuals to have a good command of English for their work. With its pivotal role for academic and occupational purposes, English has become a major factor influencing economic growth, expanding international perspectives, enhancing success in international competition and business operation, and serving as a means to connect with other countries in the region and with the international community (Clayton, 2006).

China has become a powerful economic engine since Deng Xiaoping’s economic reformation beginning in the 1970s. In fact, China’s economy has in recent years grown at an exponential rate, three times the rate of the United States’s and faster than any other economy (Gu, 2005). China’s remarkable accomplishments at the beginning of the 21st century have turned the country into a center of economic power in Asia, contributing to the promotion of Chinese language popularity both regionally and internationally. Moreover, with impressive profit potential and the low cost base of the Chinese workforce, global

organizations are strengthening their operations in China. The success of these attempts lies in part in a good command of Chinese (Fang & Olivier, in press).

Japan is one of the world leaders in exporting manufactured products. Interest in the Japanese language has become more prevalent following Japan's economic growth of the 1980s and the global popularity of Japanese pop culture in the 1990s. Japan is the only Asian country that has reached the industrial level of the major European and North American nations. Thanks to the rapid and extensive economic expansion of Japan as well as its deeply rooted national and cultural system—as manifested in the cultural preference of using Japanese for business transactions—Japanese has become an essential tool for many countries in Asia doing business with Japan (Goldman, 1994).

Arabic is the language of Islam. In the Arab world, religion plays an important part in history and culture. The language has a sacred character not only inside but also outside the Arabic-speaking Middle East. For instance, Arabic has been used in India since its arrival in the eighth century when Arab Muslims settled there, bringing with them their Islamic identity. Almost everyone who adheres to the religion of Islam learns at least some Arabic, regardless of the country they live in (Qutbuddin, 2007). The role of Arabic in Asia is also important economically as a large percentage of the gas and oil resources used in Asia come from Arabic-speaking countries like Saudi Arabia (Salmani-Nodoushan, 2007).

Korean has also emerged as an LSP in Asia in the 21st century. During the 1960s to 1990s, Korea was one of the most prosperous and affluent Asian countries, although the financial crisis of 1997 temporarily halted that prosperity. However, since the turn of the century, Korea has been immensely successful at promoting itself culturally, in what is called the “Korean wave” of cultural industry, becoming one of the world's top ten cultural exporters in 2008. With the growing success of the “Korean wave,” the Korean language has received more attention as a tool to promote Korean culture, infotainment, tourism, and business transactions (Robertson, 2005).

Specific Purposes for Language Instruction

The five LSPs in Asia serve different “specific purposes” for language instruction in Asia. Due to a much longer history of English for specific purposes, the purposes of English instruction are quite diverse. Primarily, ESP was introduced to the region for academic purposes, both in literature and the sciences, which would allow Asian scholars in diverse disciplines to follow academic discoveries and participate in the academic world. Its role in this aspect is becoming more prominent because the language is used for this purpose even within the region (Tickoo, 1988).

The role of English in Asia has branched out from being the language of education and academic exchange, especially in science and technology, to being an important language for international travel and business, politics and diplomacy, infotainment, and the Internet. As a result, many Asian universities offer classes such as English for scientists, English for business communication, and English for tourism (Blue & Harun, 2003).

The purposes for teaching Chinese, Japanese, and Korean are somewhat similar. The recent rise of China as an important economic power in the world and an attractive business partner provides an impetus for the Chinese-language boom to develop relationships with China in economy and trade. Therefore, people who can speak Chinese in Asian countries outside of China will be an important force in the 21st century. Chinese language instruction has grown not only in Asia but also internationally, being taught primarily in the fields of business, finance, and communications (Jiajing, 2007).

Similar to Chinese, the Japanese language is studied as an LSP primarily for business purposes. Using Japanese is crucial when doing business with the Japanese and their global economic strength makes Japan economically an important country. The Japanese language

has strong cultural values, traditions, and customs, and a lack of understanding and cultural awareness of the language poses a high possibility for cross-cultural misunderstandings. Knowing Japanese is particularly important in establishing business relationships with Japanese corporations, and enhancing the chance of success in establishing and expanding business in Japan (Goldman, 1994).

Arabic and Islam are united and inseparable because the language is necessary to understand the Koran, the holy book of Islam. Furthermore, oil resources located in the Arab-speaking countries provide the driving force for the growth of Arabic-language instruction. Many Westerners travel to these countries to establish oil-related businesses. Thus, in addition to religious purposes, Arabic is growing in importance as a language for both business and travel (Brosh, 2008).

Finally, the Korean language has recently become more commonly taught in Asia in LSP contexts. The language has gradually gained increasing attention because of Korea's popular culture and travel destinations. Through dramas, movies, TV shows, food, and language, Korean culture has significantly increased in popularity. Moreover, side by side with the policy of using culture as a peace ambassador, the country is a growing economic force regionally, focusing on the car industry, appliances, and computer chips. Korea's rapid expansion in these industries leads to its substantial investment in other countries in the region. In future, the Korean language will become a practical language to master, for the tourism industry and for other business purposes (Thandee, 2008).

Scopes, Methods, and Contexts of LSP Instruction in Asia

The basic tenet for LSP is based on a movement that all language teaching should be tailored to the specific learning needs of identified groups of students. However, needs analysis should be conducted on not only learners but also stakeholders, including institutions and employers, because these stakeholders may perceive needs differently from learners (Hutchinson & Waters, 1987). Given the diversity in the needs of learners, stakeholders, and target situations, LSP instruction has expanded accordingly.

Some examples of LSP courses offered in Asia include language for science and technology, economics, medicine, business communication, tourism, and social studies (see e.g., Zhang, 2007). More subject-oriented courses created by different universities cater for specific learners' needs, taking into consideration the specific skills and target situations. For instance, language for business communication encompasses a wide range of specific courses, including the teaching of general business focusing on related vocabulary to the specific skills essential in business, such as banking (Chew, 2005) and business telephoning (Cowling, 2007). Similarly, language for tourism encompasses specific courses including language for flight attendants (Robertson, 2005) and aviation (Aiguo, 2007). The emergence of these specific courses coincides with the increasing demands arising from the globalization of trade and economy, and the continuing increase of international communication in various fields.

Contexts of Instruction

LSP instruction in Asia, be it academic, vocational, or professional, usually takes place in different higher education institutions in both the government and private sectors. At the tertiary level of education, LSP courses are typically offered to students who have clear and specific goals and high motivation. With the gradual internationalization of LSP and recognition of a growing need for undergraduate students to have a reasonable command of English, LSP programs are offered to advanced students. A range of specific LSP courses

are often incorporated into degree or degree support studies at the university level. More colleges and universities place an emphasis on running different LSP courses for their students, allowing them to become competitive and competent in their future career.

Cooperation and collaboration among units of the government and private sectors are also common. For instance, the Japanese External Trade Organization (JETRO), affiliated with the Japanese government, was established to provide support for Japanese trade development. The activities of the JETRO include running a business Japanese proficiency test to measure the learners' ability to understand Japanese in a business setting, and offering a business Japanese course. Major corporations in Japan frequently arrange special courses for their executives (Karakaya & Kaynak, 1995).

Distinctive Characteristics of LSP in Asia

LSP in Asia, compared with other continents, is developing gradually, as evidenced by the emergence of the first established international online journal dedicated to ESP entitled *The Asian ESP Journal* in 2005. The first international conference on "ESP in Asia" in 2009 in China was jointly sponsored by the *Asian ESP Journal* and Chongqing University, China. The Taiwan International ESP Journal (TIESPJ) was established in 2009. Some Asian nations have their own TESOL conferences, with a special interest group (SIG) on ESP (e.g., in Thailand and Japan). Similarly, academic and professional corpora were compiled to examine key words and phraseologies specific to the field and structural organizations in texts (Kanoksilapatham, 2005; Cho, 2009).

Successful planning and designing of an LSP course that best prepares learners for future professional communication can be quite challenging. The following sections describe distinctive features that challenge the rapid development of LSP in Asia: textbooks or teaching materials, LSP teachers, teaching methodology, and learners.

Textbooks and Teaching Materials

Materials specifically addressing the needs of each professional discipline should be developed and used. The concern is whether the materials being used within LSP are authentic, up to date, and relevant for the students' specialization. Most teaching materials are commercially published textbooks written for general LSP audiences and might not be suitable, relevant, or satisfying to the Asian LSP learners' needs (Jebahi, 2009; Zangani, 2009). Therefore, extra in-house materials are needed to satisfy the regional needs of Asian LSP.

Teachers

In LSP classes, learners typically have mastery of the subject content while teachers often do not. This creates a dilemma as many language teachers do not feel confident to teach language use in professional fields they know little about, while professionals in those fields often lack the methodological and pedagogical knowledge needed to teach a language effectively (Huang, 2010). Therefore, not having adequately trained teachers for particular LSP contexts poses one of the great obstacles in developing LSP programs in many Asian countries (Kelly, 2005; Robertson, 2005). LSP programs in Japan provide a positive example as many have reached the level of professionalism needed by getting experts from different disciplines involved in developing and promoting LSP programs.

Methodology

LSP instruction in Asia—like language instruction in general in Asia—is predominantly characterized by a focus on memorizing a limited series of words and doing a limited

range of grammatical exercises while paying less attention to the communicative aspects of language (see e.g., Nurweni & Read, 1999; Jiajing, 2007). However, attempts made to improve LSP instructions to address student needs include the adoption of more communication-focused workshop activities, learning-by-doing exercises, and student-centered teaching activities (Gu, 2005). With a focus in LSP on genre analysis, more attempts have been made to focus on rhetorical awareness and language functions (e.g., apologizing, negotiating, and enquiring). To this end, there is a growing focus on interdisciplinary and regional cooperation and collaboration, including resource sharing among institutions within the region. There is a growing realization that LSP classes need to focus on not only grammar and lexis but also register, discourse, and genre to increase the chances of Asian learners to enter and successfully thrive in the competitive job market.

Learners

Despite the improvements in and access to ESP teaching materials, teacher training, and teaching methodology, the role of language learners in determining the language-learning outcome cannot be overlooked. In this regard, two relevant and interrelated issues concerning Asian learners are noted: their characteristics and their language proficiency level. Most of the Asian learners, in general, are recognized to be relatively reticent and passive in language learning (Flowerdew & Miller, 1995; Ferris & Tagg, 1996; Turner & Hiraga, 1996). One of the factors claimed to contribute to this characteristic is a lack of the required general English-language proficiency (X. Cheng, 2000). Statistically, based on their TOEFL and TOEIC scores, Asian students did not seem to perform satisfactorily (Bunnag, 2005; A. Cheng, 2006). Hutchinson and Waters (1987) have noted that a solid understanding of basic general English should precede high-level instruction in ESP if the ESP programs are to yield satisfactory results. As shown, many LSP programs in Asia are generally suitable for higher proficiency levels. If Hutchinson and Waters's assumption is valid, and if Asian learners' proficiency in English, for instance, is not improving, developing ESP, or any of the five LSP programs, in Asia remains a significant challenge.

Conclusion

LSPs in Asia are quite distinct in the roles they play in the region. Clearly, English enjoys its status as the language for academic and occupational purposes. Chinese, Japanese, and Korean are also used as languages for occupational purposes because Asia has increasingly become a hub for business and economic development. Arabic is recognized mainly as a language for religious purposes, although it has experienced growing economic importance. Will these Asian languages be promoted to become languages for academic purposes like English? The answer to this question is likely to be negative. Whereas English is the primary international language used in the pursuit and publication of knowledge and the development of technology, it is hard to see these other languages in that light in the near future; one major barrier, in fact, is due to the unique characteristic of their writing systems. The fact that most Western countries have adopted the Roman alphabet puts Asian languages internationally at a disadvantage.

Language for Specific Purposes in Eastern Europe

ESTELA ENE

Historical Background

Eastern Europe is an area of constant change. Geographically, Europe's eastern border is along the Ural Mountains, which cross western Russia almost north to south. The western edge of Eastern Europe is a dynamic geopolitical concept. After World War II, throughout the Cold War era and until the fall of the Iron Curtain in 1989, Eastern Europe began with East Germany (the German Democratic Republic, since reunited with West Germany). Through the 1990s, Eastern Europe was understood as the space named the Eastern Bloc. The countries in it—East Germany, Poland, Hungary, Bulgaria, Czechoslovakia, Romania, Albania and Yugoslavia—were under communist regimes dictated by the Soviet Union.

Following the fall of the Berlin Wall, states (re)gained their autonomy and the European Union (EU) expanded. In the United Nations' definition, Eastern Europe includes ten countries: Belarus, Bulgaria, the Czech Republic, Hungary, Moldova, Poland, Romania, the Russian Federation, Slovakia, and the Ukraine. Today, especially on the region's western edge, the term "Eastern European" may be perceived as a derogatory allusion to the communist past and the developing economies of the area. Citizens and governments alike insist that the European spirit, more than its political tribulations, defines Eastern Europe.

This entry focuses on 12 countries most commonly categorized as Eastern European. Six are EU members (Bulgaria, the Czech Republic, Hungary, Poland, Romania, and Slovakia); two are candidate states (Croatia and the former Yugoslav republic of Macedonia); four are not (Belarus, the Republic of Moldova, the Russian Federation, and the Ukraine).

Language Policies in the Eastern Bloc

Language policies in the Eastern Bloc (Eastern Europe before 1989) reflected the lack of freedom in the area. The collective experience was strikingly similar across the region. Before World War II, French and German were the languages the cultured elites would learn in order to study abroad, travel, or develop careers in business, politics, or science. After the war, Russian became the mandatory foreign language in school, but negative attitudes toward the imposed language prevented it from becoming a tool of international communication. Travel was restricted to the Eastern Bloc, so the need for other languages was limited. French was the second most commonly taught foreign language, partly due to a shortage of teachers of Russian along with an increased number of educated, well-off individuals dispossessed by the communists and forced to work, and partly due to tradition. Grammar translation and audiolingualism ruled, and the generally accepted philosophy was that one learns a foreign language for intellectual enrichment, without a practical specific purpose. Before the dissolution of the Eastern Bloc, German and English

were gradually reintroduced in the curricula to appease international criticism and demonstrate competitiveness. This happened earlier in central Eastern Europe: Poland had a “more liberal communist government with more permissive policies toward English-language instruction” as early as 1960 (Reichelt, 2005).

Eastern Europe, the European Union, and LSP

The current EU has 23 official working languages—the official languages of the 27 member states, including some that are shared by two or more countries (German, French, Italian, Dutch, English, Swedish, Greek) and a few regional languages with official status (Basque, Catalan, and Galician). Eleven official EU languages are from central and Eastern Europe. The European Commission conducts its daily business in English, French, and German, its procedural languages. About 60 other indigenous and non-indigenous languages are spoken in the EU, which is now home to more than 500 million people.

The two most important processes with effects on language instruction and use in Europe overall are:

1. The *New Framework Strategy for Multilingualism*, developed by Leonard Orban from Romania and adopted by the European Commission (2005) to achieve “**The three core aims** . . . to encourage language learning, to promote a healthy multilingual economy, and to give all EU citizens access to legislation, procedures and information of the Union in their own language” (European Commission, 2006, p. 4).
2. The Bologna Process, initiated in 1999, whose “overarching aim [is] . . . to create a European Higher Education Area (EHEA) based on international cooperation and academic exchange that is attractive to European students and staff as well as to students and staff from other parts of the world” (European Higher Education Area, 2009).

These have influenced EU member and non-member states. The need and desire to interact with member states or gain EU admission has motivated countries to align policies. Thus, as a result of (1) above, most European countries require that two foreign languages be introduced to schoolchildren at an early age, one in primary school and the other in secondary school. As a response to (2), university curricula are becoming more uniform and instruction in English is increasingly common.

In November 2005, the Eurobarometer study on multilingualism (European Commission, 2006) surveyed 28,694 citizens from the 25 EU countries at the time, Bulgaria and Romania (since admitted), and Croatia and Turkey (currently candidate states). The study found that:

- 56% of EU citizens are able to hold a conversation in a language other than their mother tongue, and 28% in two languages (p. 8).
- The foreign languages spoken in the surveyed countries are “limited to” (p. 12): English (38%), French (14%), German (14%), Spanish (6%), and Russian (6%).
- In Eastern Europe, some of the smallest states have some of the highest percentages of citizens who can hold a conversation in at least one language other than their mother tongue (see Table 1 below). This may be due to the fact that they separated from former multilingual federations (Yugoslavia and Soviet states), and their size forces them to look outside their borders to fulfill their economic needs.
- As can be seen in Table 2 below, English is the most commonly spoken foreign language for specific purposes (LSP). In countries closer to Germany or Austria (the Czech Republic, Hungary, and Slovakia), German has a slight lead over English or ties with

Table 1 Percentages of respondents who can speak more than their mother tongue, by country (adapted from European Commission, 2006, p. 9)

	<i>At least one language</i>	<i>At least two languages</i>	<i>At least three languages</i>	<i>None</i>
Slovakia	97	48	22	3
Latvia	95	51	14	5
Lithuania	92	51	16	8
Malta	92	68	23	8
Slovenia	91	71	40	9
Estonia	89	58	24	11
Cyprus	78	22	6	22
Croatia	71	36	11	29
Czech Rep.	61	29	10	39
Greece	57	19	4	43
Poland	57	32	4	43
Bulgaria	59	31	8	41
Romania	47	27	6	53
Hungary	42	27	20	58
Turkey	33	5	1	67

Table 2 Languages spoken other than the mother tongue, by country (adapted from European Commission, 2006, p. 13)

<i>Czech Rep.</i>	<i>Estonia</i>	<i>Greece</i>	<i>Cyprus</i>	<i>Latvia</i>
German 28%	Russian 66%	English 48%	English 76%	Russian 70%
English 24%	English 46%	German 9%	French 12%	English 39%
Russian 20%	German 22%	French 8%	German 5%	Latvian 23%
<i>Lithuania</i>	<i>Hungary</i>	<i>Malta</i>	<i>Poland</i>	<i>Slovenia</i>
Russian 80%	German 25%	English 88%	English 29%	Croatian 59%
English 32%	English 23%	Italian 66%	Russian 26%	English 57%
Polish 15%	Other 11%	French 17%	German 19%	German 50%
<i>Slovakia</i>	<i>Bulgaria</i>	<i>Croatia</i>	<i>Romania</i>	<i>Turkey</i>
English/German 32%	Russian 35%	English 49%	English 29%	English 17%
Russian 29%	English 23%	German 34%	French 24%	Turkish 7%
Czech 25%	German 12%	Italian 14%	German 6%	German 4%

it. Russian is strong in the former Soviet states (Estonia, Latvia, Lithuania) and in Bulgaria, whose native language and cultural heritage is Slavic.

- 47% of those surveyed who know at least one foreign language indicate that they use it every day, and English occupies the first place among the languages used daily, followed by Spanish and German (p. 17).
- The purposes of a language other than the mother tongue are, from most to least frequent: travel; work; personal satisfaction; a better job in one's own country or another; understanding people from other cultures; study in another country (p. 36). "When **the prospect of working in another** country is at stake, Lithuanians (45%), Estonians (43%), Slovaks (42%) and Romanians (42%) are the most numerous to be motivated. The possibility of **studying abroad is the most motivating factor** for Cypriots (31%) and Estonians (29%)" (p. 36, emphasis in original). Europeans perceive English as the most useful language for one's professional advancement.

Overall, Eastern European countries "look at English as the window to the West and embrace English as a means of communication" (Ustinova, 2005, p. 240). Due to their historic, geopolitical, and economic context, they have also strengthened the status of German, French, Spanish, and Russian.

Documented Uses of English for Specific Purposes (ESP)

The sections below provide a review of the ESP/LSP domains represented in the widely accessible literature. Generally, Eastern Europe is more involved in practicing LSP than theorizing about it. An uneven, limited, and possibly unrepresentative amount of research transpires from the area, with some countries and fields of interest well represented and others not at all, although institutional Web sites suggest intense LSP/ESP activity in language programs.

Throughout the region, many professions cannot be imagined without English: business people and their assistants, computer scientists, academics, diplomats (Dimova, 2005; Ustinova, 2005). Graduate and undergraduate programs in business and legal English are some of the most well-established in further education, even at smaller institutions, though the same is not true for research on business and legal English.

Some research exists on English for commercial purposes. Dimova (2008) studied the effects of English on commercial naming by analyzing over 9,000 business names from the Macedonian Yellow Pages. The analysis was also undertaken in Russia, Slovenia, Bulgaria, and Poland (Griffin, 1997, 2001; Schlick, 2002; Ustinova, 2006). English was the dominant foreign language in commercial naming in large cities and in businesses related to computers and electronics, followed by fashion and hospitality. Bielenia-Grajewska (2009) found universal (Lakoff & Johnson, 1980) and context-specific metaphors in a corpus of investment banking language materials in English, German, Spanish, and Polish.

English for academic purposes (EAP) topics from academic and scientific writing are the most frequent in the literature about ESP in Eastern Europe. Some studies examine instruction, for example, in Poland (Reichelt, 2005) and in Hungary (online and in the classroom; Futász & Timár, 2006); most are genre analyses in the contrastive rhetoric framework (Kaplan, 1987; Connor, 2002). Petrić (2005) from Serbia conducted a case study of Russian students' academic writing in English, and found that at the beginning of a semester the students' writing patterns were "Slavic"—tolerant of digressions, with less subsectioning and a gradually developed thesis (pp. 215–16). Godó (2008) analyzed Hungarian and North American college students' argumentative essays and concluded that in "Hungarian education, similarly to Czech and Polish contexts . . . the focus is on preserving and passing on the intellectual heritage of the community without re-interpreting

or re-evaluating it" (p. 85). Vassileva (2001) examined English, Bulgarian, and Bulgarian English research articles in linguistics, looking at the use of hedges and boosters. Her goal was to "facilitate the teaching of academic writing in English to Bulgarians, but also to appeal for a better understanding and tolerance of culture-specific features with a view to preserving cultural identity when using English as the international language of academic communication" (p. 83).

The field of translation/interpretation contributes to the development of ESP studies and applications substantially. Alongside language teachers, translators and interpreters are considered instrumental in creating a mobile multilingual society, and highlighted as such in EU language policies (European Commission, 2005, p. 10). Some studies focus on issues of teaching English for translation/interpretation. Yankova (2008) sheds light on the sophisticated translation mechanisms of the European Commission and the need for translators/interpreters to master languages for legal purposes. Creangă (2008) recommends process- and task-based approaches to translation training, collaboration with subject matter experts, and authentic projects. Micic (2008) advocates that translation exercises should be used to teach medical professionals to recognize different medical genres in English and Serbian.

Translators/interpreters and editors also transfer insights from their work to applications in the teaching and practice of scientific writing (Mišak, Marušik, & Marušik, 2005). Professional organizations such as the European Association for Research on Learning and Instruction, the European Association of Languages for Specific Purposes, Mediterranean Editors and Translators, and the European Association of Science Editors, well attended by Eastern European scholars, analyze cross-cultural patterns to prepare researchers to publish in English-language scholarly journals from many fields. All of the above publications and activities use ESP as an object of study and a means of communication, thus contributing to the development of ESP on multiple levels.

ESP Instruction

English teachers seem to have the resources and opportunities to enhance their linguistic and pedagogical abilities, some of which would affect the teaching of ESP. All Eastern European countries are TESOL and/or IATEFL affiliates, or have equivalent associations for teachers of English which maintain increasing membership, Web sites, conferences, and/or journals. Many universities publish journals partially or entirely in English. The British Council and US Embassies have been actively developing language teaching services and libraries, and promoting study abroad and exchange programs. English native-speaking lecturers and professors are no longer rare, and English majors are often expected to attain "near-native English speaking standards" (Reichelt, 2005, p. 223). In Macedonia, Peace Corps volunteers provide programs on English-language teaching and business English (Dimova, 2005, p. 195). The more developed a country, the more resources are available.

Instructional experiences vary. Historic overviews of abundant research in language teaching in Poland from 2000 to 2006 note state-of-the-art practices in teaching and research (Siek-Piskozub, Wach, & Raulinajtys, 2008). On the other hand, some Hungarian authors are skeptical about the quality of ESP instruction offered in response to increasing demand: "While the business community is clamoring for better ESP skilled graduates, our higher educational institutions . . . simply provide students with L2 classes towards the students obtaining an *intermediate level state accredited language certificate*" (Tar, Csobán Varga, & Wiwczarowski, 2009, p. 2, emphasis in original). Anecdotal and research accounts acknowledge that teachers may face difficulties mastering communicative techniques, speaking and presentation skills, and lexical and grammatical knowledge. In universities, ESP instruction

is often provided by instructors who are classically trained in English language, literature, and pedagogy, who educate themselves about ESP prior to or while teaching a course, and often have to spend a considerable amount of time on solving the students' basic general language needs first. In Macedonia, universities require that non-English majors take one or two semesters of English (Reichelt, 2005, p. 223); in Russia, three to five (Ustinova, 2005); in Romania, two; and in Serbia, the Belgrade University School of Medicine requires two years of English (Micic, 2008). Officially, courses may be tailored to any specific purpose. To reach the desired competence, many students supplement their studies in private language institutes or with private tutors (Reichelt, 2005, p. 223).

English-medium universities are a growing trend in higher education in Eastern and Western Europe. Such educational environments contribute to the spread and internationalization of ESP by teaching and practicing it. In Macedonia, private colleges and universities with English as a partial or the only language of instruction have existed since 2001 (Dimova, 2005, p. 196). In Romania, the Romanian-American University, with partial English instruction in journalism, economics, management, finance, law, tourism, and other subjects, has been operating since 1991. Hungary's capital, Budapest, has been the home of the English-medium Central European University since 1991. CEU students come from over 100 countries from five continents, and the faculty from 30 countries. Accredited in Europe and the US, CEU offers graduate degrees in social sciences, the humanities, law, and management.

Is English a Threat?

Does the current dominance of English threaten to shut out individuals, countries, or professions that prefer another language? Is it robbing other languages of scientific registers? Bibliometric research has revealed repeatedly that the above concerns exist, and scholars have to pay more to study another language, hire editors, or spend a long time redrafting their work in order to meet academic demands. Kourilova (1998) and Curry and Lillis (2004) express concerns in their studies of Slovak medical researchers' English-language submissions to biomedical journals, and of Hungarian, Slovak, and Spanish psychologists, respectively. However, Ferguson (2007) finds that non-native users of English get published as much as native speakers, and warns of a more worrisome correlation between a society's wealth and its presence in the international publication arena. In Eastern Europe, many economies are yet to become stable.

Other LSPs

German, French, Spanish, and Russian are used primarily for professional and vocational purposes, and only secondarily for international communication. Their use is related to increased international communication, trade, and migration to the West, as well as to the intellectual traditions and geopolitics explained above. These languages are represented—though less strongly than English—in academic programs, professional organizations, cultural centers, and government agencies. From the French perspective, Blin and Péchenart (2007) examine French for professional purposes and advocate a pedagogical shift toward functional and content-based approaches. Eckerth and Tschirner (2009) reflect on the changing status of German in the EU. As for Russian, “While [it] lost the battle for dominance in East European countries, its position is still strong within the Russian Federation” (Ustinova, 2005, p. 240), although within two decades English may replace Russian there, too, as the young are becoming more reluctant to learn Russian (p. 251).

Conclusion

Overall, in Eastern Europe, LSP and especially ESP have progressed spectacularly. LSP's virtual non-existence during the communist era has been replaced by the global trend toward ESP, while the increased popularity of German, French, Spanish, and Russian have enhanced their status. Eastern Europe remains an area of intricate complexities that will be interesting to observe as these countries continue to redefine themselves in response to local and global needs.

Language for Tourism

MIGUEL F. RUIZ-GARRIDO AND ANA MARÍA SAORÍN-IBORRA

Language for tourism has developed relatively recently as a field within languages for specific purposes (LSP), joining other more widely known and longer-established specific language disciplines such as business, science and technology, and academic purposes. Owing to the socioeconomic importance of tourism and its business nature, the language for tourism has often been included within the language for business. In fact, in some tourism dictionaries (e.g., Reily-Collins, 1996; Alcaraz Varó, Hughes, Campos Pardillo, Pina Medina & Alesón Carbonell, 2000), apart from the specific semantic fields related to tourism (catering, accommodation, weather, art, or culture), some sections are devoted to more purely business fields (accounting or finance). However, many scholars claim there is distinct specificity within the language of tourism (e.g., Dann, 1996; Gotti, 2006), and thus it warrants separate treatment. Although English seems to be the most widely researched language in the field of tourism, other languages have also been studied, such as Spanish and French, among others (see Dann & Johanson, 2009).

Defining language for tourism is not easy. Nigro (2006, p. 187) notes that language for tourism has been classified in different ways, as for example the language of promotion (Dann, 1996) or the language of consumerism (Moeran, 1983). Thus, the attempts to define language for tourism reveal that it is a multifaceted term reflecting both complexity and heterogeneity; it mirrors both the professional and contextual structure where it is used. According to the World Tourism Organization, tourism comprises

the activities of persons traveling to and staying in places outside their usual environment for not more than one consecutive year for leisure, business and other purposes not related to the exercise of an activity remunerated from within the place visited. (2007, p. 1)

This industry definition substantiates the interdisciplinary character of language for tourism and highlights its diverse features (lexical/semantic, syntactic, etc.). Consequently, in order to describe this specific type of language, it is first necessary to explain the professional context of tourism.

The Complex Domain of the Tourist Industry and the Language for Tourism

The linguistic features of tourism discourse are strongly connected to the diverse services of the tourism industry, which is divided into many independent businesses with different organizations, aims, and types of services offered (e.g., Aguirre Beltrán & Hernández, 1985; Youell, 2000; Calvi, 2001).

The tourism industry covers any activity carried out by people traveling for any reason (leisure, business, and visiting relatives and friends) as well as any services visitors/tourists are offered during their stay. Ruiz-Garrido and Saorín-Iborra (2006, p. 10) summarize some complementary divisions in this field, including

2 LANGUAGE FOR TOURISM

- services offered and related industries: accommodation (hotels, hostels, campsites, resorts), food (restaurants, pubs, meals, gastronomy), transport, travel agencies, tourist information centers, leisure (guided tours, tourist attractions, tourist development, promotion), tourist operators, etc.;
- stages in a trip, including tourists' needs: initial arrangements and journey (information, buying/booking, transport), customs (document control), and services at destination (transport, accommodation and meals, information, attractions, leisure, buying, public services); and
- jobs: professionals managing and running the different tourist services (hotel managers, market researchers) and professionals with a very specific training (tour guides, flight attendants, hotel concierges, skiing instructors).

In order to understand the complexity of the field of tourism, it is important to consider the roles of the client and the product of the tourist industry. On the one hand, the tourist product is rather a service, something intangible, unlike many business-related products (e.g., Dale & Oliver, 2000; Holloway, 2002). On the other hand, it is the client who determines the success or failure of the tourist businesses/services. Considering some authors' works (Calvi, 2006; Gotti, 2006), specialists in the tourism industry may be involved in three main communicative situations: (a) specialist–specialist communication, (b) specialist–non-specialist communication, and (c) specialist–client communication. The first situation happens when “the expert addresses other specialists to debate issues within his professional field, to discuss a project, report results, explain the use of equipment, etc.” (Gotti, 2006, p. 20). The second situation is when specialists prepare informative documents addressed to non-specialists or semi-specialists, such as textbooks or articles in specialized newspapers/magazines. Finally, the third situation, probably the most common one, is when the communication between clients/non-specialists and specialists happens and in which experts need to adapt their discourse to the clients' level of expertise, having to use everyday language together with some specialized expressions (e.g., in travel agencies, guided touring, and popular newspapers/magazines). Personal contact with tourists/travelers stands out as a basic difference between the language for tourism and professional communication in general (Calvi, 2001). Thus, customer care is perhaps the most important task within the tourist industry, since the quality of services the customers receive will determine the future of any tourist business. It is for these reasons that the distinct features of the language of tourism require a special focus and investigation.

Main Features of the Language for Tourism

Dann's (1996) sociolinguistic study is considered by many the seminal work about the language for tourism. He considers this specialized language mainly as a promotional act with a discourse of its own, and is typically limited to the professionals and customers who use it. He emphasizes that this language tries to persuade, attract, and seduce through images, written texts, and audiovisual means (that is, through multimodal discourse), to entice thousands of people to become customers. Research literature on the issue validates this approach as the most common view of the language for tourism (e.g., Cappelli, 2006), although purely informative and objective materials for tourists and professionals also exist within this field.

Dann (1996) describes these promotional and persuasive characteristics of the language for tourism according to four theoretical sociolinguistic perspectives: authenticity, strangerhood, play, and conflict perspectives. Authenticity and the language of authentication refer to the real sociocultural symbols tourists look for when visiting a place (e.g., *Tapas isn't Spain's national dish, but rather Spain's way of life* [www.in-spain.info]). Strangerhood

and the language of differentiation deal with tourists' desires to experience something new, a dissimilar reality from their own (e.g., *There is something unique about Istanbul. It is the only city in the world that straddles two continents – Europe and Asia* [<http://www.bloggersbase.com/travel/unique-istanbul/>]). The play perspective and the language of recreation focus on tourism as a game and tourists as players looking for pleasure and fun (e.g., *Sun, water and fun: the Spanish coast is the perfect place to enjoy water sports* [http://www.spain.info/en_US/disfruta/])). Finally, the conflict perspective and the language of appropriation refer to the contrast tourists try to find when traveling (e.g., *Within the borders of a single country, you will find savannahs rich with big game, timeless cultures unchanged by the modern world, . . .* [<http://www.magicalkenya.com/>])). Those perspectives and the language they represent do not necessarily appear individually but they are often combined through the use of different linguistic techniques. That way, the motivational effect on the tourist is achieved.

As Gotti (2006) notes, disciplinary variation is based on lexical/semantic, morphosyntactic, textual, and pragmatic features. Therefore, the knowledge and proper combination of the different competences involved in a language (linguistic, discourse, functional, etc.) are key matters to develop accurate communicative situations between professionals and tourists/visitors (Ruiz-Garrido & Saorín-Iborra, 2006).

In terms of linguistic competence, vocabulary is probably the linguistic aspect that differs most significantly from other LSP disciplines like business, and thus requires the greatest attention from teachers and students alike. Most words used in tourism are considered semi-technical; that is, the field draws on everyday vocabulary, however these words either appear more frequently or with a more specific meaning than typically used in everyday contexts (e.g., *finger*, a part of the hands or a long thin-shaped area of land, whereas at the airport it's the walkway used to embark to or disembark from the aircraft; *package* used in combination with other daily terms can form specialized expressions, such as *tour package*, *holiday package*, *combined package*). According to some scholars (Dann, 1996; Calvi, 2001; Cappelli, 2006; Gotti, 2006), some characteristic lexical/semantic features of the language of tourism include

- choosing appropriate keywords that draw the customer's attention (e.g., *perfect seaside holidays*, *magnificent seafood restaurants*) or other language techniques such as using words in the original language;
- using certain expressions which mean only one thing in specific contexts (monoreferentiality, e.g., *boarding card*, *tour operator*);
- expressing concepts in the shortest possible form (i.e., blending, acronyms, e.g., *campsite* vs. *camping site*, *ID* vs. *identity document*);
- creating specialized new terms derived from general and common language, for example through metaphorization (using similes and metaphors, e.g., *island-hopping*, *package holidays*);
- borrowing terms from the specialized language of closely related fields, such as economics (e.g., *handling agents*, *seasonality*), geography (e.g., *border*, *gorge*), history of art (e.g., *chancel*, *choir*), craftsmanship (e.g., *handmade*, *pottery*), and transport (e.g., *ground staff*, *open-jaw ticket*); and
- using emphatic and evaluative lexis, including emphasizees (e.g., *breathtaking scenery*, *exquisite service*), superlative forms (e.g., *the best option*, *the most peaceful of all the lakes*), or intensifier adverbs (e.g., *totally unspoiled*, *a very good buy*). This is called *hyperbolic language* by Alcaraz Varó et al. (2000).

The syntax of the language for tourism, also within the linguistic competence, is characterized by

- compact syntactic structures by means of affixes, simplifying sentences by omitting unnecessary words or using elliptical forms to express conciseness (e.g., *self-catering accommodation* vs. *accommodation where you can cook your own meals*, *pre-arranged car rental* vs. *car rental which has been arranged previously* [Gotti, 2006, pp. 28–9]);
- temporal contrast (e.g., *The city does not have outstanding attractions, but it has some excellent restaurants and many nice shops* [Cappelli, 2006, p. 62]);
- informal language structures and conversational style (called *ego-targeting* by Dann [1996], e.g., *We'll save you a seat. Call . . . , your very own . . .* [Cappelli, 2006, p. 62]);
- tense switching (e.g., *During . . . times, the [name] family turned the mansion into a girls' boarding school, . . . In the main house hangs a Rembrandt . . .*), the historic present (e.g., *George Washington is elected President of and presides over the Federal Convention of 1787* [<http://presidentgeorgewashington.wordpress.com>]), or old-fashioned accents to construct the typical “magic effect” which is common in tourism promotional material; however, this property can also be created visually or through certain lexical choices (names of hotels, attractions, etc.); and
- imperative mood (e.g., *Don't miss . . . , Come and visit [country]*), rhetorical questions (e.g., *Are you looking for accommodation?, Travelling with children?*), or negative interrogatives (e.g., *Why not discover [country] through its sea beds?, Isn't it time to treat yourself?*) to build the concept of language for tourism as language for social control (Dann, 1996).

Textual features are mainly concerned with text genres and their textual organization. For instance, Cappelli (2006) mentions the *testimony* technique (other tourists' personal opinions about a destination or service from their own experience), which is used in certain written genres to avoid impersonality and the monological features of promotional language. Although several oral communicative situations are of great importance in the tourism sector (customer attention, guided touring), most research has focused on common written genres like tourist guides/guidebooks, articles in specialized journals and general magazines, brochures and other advertising materials, commercial and promotional Web sites, itineraries, professional correspondence, trip reports, reviews, or travelogues. Cappelli (2006, p. 95) arranges these genres according to what she calls the *tourist cycle*, following Dann's (1996, p. 140) stages of a trip (pre-trip, on-trip, post-trip). Apart from verbal techniques, those genres also include visual techniques (color, format, visual cliché, and connotation procedures) or verbal and visual techniques combined (puzzles, temporal contrast, collage, ousting of competition, infraction of taboo, and significant omission) (Dann, 1996); these elements produce similar effects on the tourists just as the above lexical/semantic and syntactical features are designed to do.

Along with the multidisciplinary nature of the language for tourism, Balboni (1989) states that the language for tourism is made up of a set of interrelated microlanguages which can be more or less relevant in each involved professional sector: the microlanguage for hospitality and catering, for international bureaucracy, for transportation, or for the history of art. Likewise, Dann (1996) refers to different registers found in the language for tourism when promoting certain market segments: register of nostalgia, of health, of food and drink, and of ecotourism.

Sociolinguistic and pragmatic competences are also essential because unique situations may require distinct linguistic performances as tourism professionals encounter diverse tourists' needs. Therefore, being aware of linguistic markers of social relationships, politeness conventions, various registers, or even dialectal variations is a necessity. The main attribute of contemporary tourism is its international character, which requires today's professionals to possess a broad knowledge base for all sorts of unpredictable situations

that they may encounter in daily tasks so that they can respond in culturally appropriate ways—often across different cultures and languages.

This international dimension, together with the wide range of professional fields included in the tourism industry, leads to another pertinent feature: the cultural factor (Dimanche, 1994). Although this element is also present in other specialized languages, it is within the language for tourism that the intercultural competence is especially relevant (e.g., Calvi, 2001). Calvi (2001) indicates four components of the intercultural competence tourist professionals need to use: identify and overcome the stereotypes of the foreign culture, cultural awareness, communicative and pragmatic competence, and knowledge of diverse fields and the ability to relate this knowledge to the appropriate linguistic elements.

Overall, the language for tourism has several peculiarities that make it different from other specialized languages. Although it shares some characteristics with other LSPs (such as the language for business), the particular features highlighted above are unique as a result of the intrinsic complexity of the tourist industry.

Language Ideology and Public Discourse

TOMMASO M. MILANI

Over the past two decades, the notion of language ideology has gained considerable momentum in different strands of scholarship that aim to unpack how language works in society. Language ideology has its roots in North American linguistic anthropology as a concept within which to explore the “mediating links between social forms and forms of talk” (Woolard, 1998, p. 3). Whilst it is axiomatic for linguists that “all languages are equal” in terms of their meaning-making potential and their worth as objects of academic inquiry, a cursory glance at any sociolinguistic environment in the “real world” will reveal a different scenario—one in which linguistic phenomena are unequally ranked according to different meanings and values, so that, say, “language” X is believed to be lexically richer, more logical or beautiful, and thus better suited for wider communication within a polity than “dialect” Y. It is precisely the belief systems underlying such social processes of naming, signifying, and valorizing linguistic practices that the notion of language ideology aims to capture. This entry will begin by clarifying the notion of language ideology, followed by a reflection over the notions of public versus private in relation to language ideology. The entry will conclude with some current developments and directions in language ideology research.

Language Ideology and Public Discourse

According to Silverstein, who is possibly the first scholar who put forward a definition of the term, language ideology consists of “sets of beliefs about language articulated by users as a rationalization or justification of perceived language structure and use” (Silverstein, 1979, p. 193). Focusing less on rationalization, and highlighting instead the sociocultural situatedness of beliefs about language, Irvine claims that language ideology is “the cultural (or subcultural) system of ideas about social and linguistic relationships, together with their loading of moral and political interests” (Irvine, 1989, p. 255). Kroskrity, on the other hand, puts more emphasis on the perspectives of specific individuals and institutions in ideological production, suggesting that language ideology encompasses the “beliefs, feelings, and conceptions about language structure and use that . . . index the political economic interests of individual speakers, ethnic and other interest groups and nation states” (Kroskrity, 2002, p. 1). These indexical linkages between “social” and “linguistic” relationships have been made more precise by Woolard, who states that “ideologies of language are *not about language alone*. Rather, they envision and enact ties of language to identity, to aesthetics, to morality, and to epistemology” (Woolard, 1998, p. 3; emphasis added). In sum, the notion of language ideology aims to grasp the belief systems through which linguistic phenomena are invested with specific meanings and values, through linkages to broader sociocultural categories.

The words “ideas” and “beliefs” might convey that we are dealing with some kind of inner states lodged somewhere in a speaker’s mind. Whilst the cognitive dimension of such ideas and beliefs about language should not be dismissed a priori, Cameron reminds

us that ideologies are ultimately “social constructs: they are ways of understanding the world that emerge from interaction with particular (public) representations of it” (2003, p. 448). Here, the terms “representations” and “public” are key.

If we agree that research on language ideologies aims to understand how linguistic phenomena are imbued with particular meanings and values in discourse, and become over time culturally scripted in conventional ways, representations *about* language—that is, what people overtly say and write about languages or even how they visually represent them—provide the analyst with the most patent and fruitful repository of beliefs about language. In a similar vein, a focus on *public* representations is motivated by the accessibility of these texts (see below, however, for a reservation). Furthermore, a focus on public, rather than private, representations is of political relevance because of the *potential impact* that such representations might have for a mass audience (though see below for a problematization of the public/private dichotomy).

Against this backdrop, it is perhaps unsurprising that studies of language ideologies have concentrated largely on public debates about language, debates which were often orchestrated by different media providers in different contexts (see Blommaert & Verschueren, 1998; Blommaert, 1999; Blackledge, 2005; Johnson & Ensslin, 2007; Johnson & Milani, 2010; Milani, 2010). This leaves us with the question of the extent to which language ideologies that are circulated in the public arena are reproduced or contested in apparently more mundane, private contexts (see Kroskrity, 2002, for a similar observation).

Language Ideologies: Differences and Commonalities

It is a truism that language ideologies can assume very different guises in different contexts. For example, in 2010, a friend of a friend candidly disclosed at a dinner table in Johannesburg, South Africa, that he firmly believed that isiZulu is a rudimentary and deficient language, unlike his “home language,” English, which in his opinion is full-fledged, complex, and refined. Nearly at the same time, but thousands of kilometers northwards, the ultra-right-wing Swedish party Sveridemokraterna (lit. “Swedish Democrats”) proposed as part of their electoral manifesto the abolition of mother-tongue instruction in Swedish schools. Rickard Jomshof, the party’s chairperson on educational matters, put it clearly in an interview with a Swedish broadcaster, available on YouTube in February 2011: “in Swedish schools one speaks Swedish irrespective of one’s origin; . . . if you come from abroad and you have the right to stay in the country, Swedish shall be your mother tongue; it is Swedish that you shall learn”. On a very different note, on the Web page of one of the largest media projects about language in the UK, financed by the BBC, one commenter stated that, “It has been suggested that men think logically, whilst women think emotionally. With neither understanding the other. Gordon from Boston, UK” (<http://www.bbc.co.uk/voices>).

Of course, thirty years of scholarship in applied linguistics have proved these statements to be “myths,” in Cameron’s (2007) interpretation of the term. They are not just “widespread but false belief[s]” (Cameron, 2007, p. 3). They are also stories that “people tell in order to explain who they are, where they come from, and why they live as they do. Whether or not they are ‘true’ . . . , such stories have consequences in the real world. They shape our beliefs, and so influence our actions” (Cameron, 2007, p. 4). A quick glance at the linguistic structure of isiZulu will reveal that this language is far from being rudimentary and indeed shows a high degree of grammatical complexity. What is interesting is not that the pronouncement about isiZulu’s simplicity is false, but that it is the materialization of the legacy of apartheid South Africa and its devaluing of African languages—ideological baggage that is deeply entrenched in many South Africans irrespective of race. Similarly,

research on bi/multilingualism has convincingly illustrated the benefits of mother-tongue and bilingual education (see Baker, 2006, for an overview). Regardless of this scientific evidence, the statement made by the representative of the Swedish Democrats shows the currency in political contexts of the belief that there should be only one language as the medium of instruction (see Cummins, 2008). Such a view is not innocuous because it is deeply bound up with Romantic ideas about the importance of the homogeneity of the nation for the good functioning of society (see also Blommaert & Verschueren, 1998). This, in turn, leads to the discrediting of minority languages and multilingualism to the advantage of one “national” language. Finally, research on language and gender has demonstrated that there are more similarities than differences in the ways in which men and women speak (see in particular Cameron, 2007). However, the comment posted on the BBC Web site is an example of the reproduction of the belief that “men are from Mars and women are from Venus” (Gray, 1992), and that gender differences lead to an unavoidable incomprehension between the two sexes. Such a conviction about miscommunication is not harmless, but is strategically invoked by men because “[p]retending not to understand what someone [i.e., women] wants you to do is one way to avoid doing it” (Cameron, 2007, p. 89).

Notwithstanding the differences in the ideological underpinnings of the above statements, what is crucial to highlight is that language ideologies share deep-rooted traits. With this in mind, Irvine and Gal (2000) have proposed three semiotic processes that could be taken as “universals” of language ideologies. Through these processes, the authors set out to explain “similarities in the ways ideologies ‘recognise’ (or misrecognise) linguistic differences, and how they locate, interpret, and rationalize sociolinguistic complexity, identifying linguistic varieties with ‘typical’ persons and activities and accounting for the differentiation among them” (Irvine & Gal, 2000, p. 37). These processes are *iconization*, *fractal recursivity*, and *erasure*. First, through iconization, “linguistic features come to depict or display a social group’s inherent nature or essence” (Irvine & Gal, 2000, p. 37). The second process, fractal recursivity, involves “the projection of an opposition salient at some level of relationship onto some other level” (p. 37). Finally, erasure is simplification by rendering certain voices inaudible—in other words, certain stories are not told (p. 39).

Irvine and Gal exemplify iconization, fractal recursivity, and erasure by looking at a few historical cases from Southern and Western Africa as well as the Balkans. Most notably, more recent studies have testified to the cross-cultural and contemporary relevance of these semiotic processes (see, e.g., Stroud, 2004; Blackledge, 2005; Milani, 2010; Androutsopoulos, 2010). To take but one example, Blackledge (2004, 2005) has analyzed media texts and policy documents about multilingualism in the UK in the wake of the social unrest—the so-called “race riots”—which broke out in 2001. The main point put forward by Blackledge is that a perceived or presumed “lack of English” among migrants is “iconically associated with a predisposition to be *keen* to join in with violent criminal activity” (Blackledge, 2004, p. 79; emphasis in original). Blackledge (2004, pp. 29–30) further shows how an opposition at a linguistic level (proficiency in English vs. lack of English language skills) recurs on other dimensions (e.g., presence vs. lack of social cohesion; social order vs. disorder). What is erased from this picture is the wide social, ethnic, linguistic, and cultural diversity that characterizes migrants.

Public Versus Private?

Public discourse is perhaps one of the fuzziest notions in academic writing (see Wodak & Koller, 2010). It is difficult to dispute that a Web page on an Internet site is an example of public discourse. This is insofar as such a Web page is potentially available to everyone

who has access to a technological device which is connected to the Internet. But does a conversation in a queue at an electoral ballot count as public discourse? What about an exchange between a teacher and their pupils in a state school?

From a structuralist point of view, one could argue that the notion of “public” derives its meaning *ex negativo* from its opposite, “private.” However, Fairclough (1995) reminds us that it is a difficult, if not impossible, task to clearly define the boundaries between “public” and “private” in late-modern societies. Not only has there been a progressive “conversationalization” of public discourse in such a way that public texts have become increasingly more reminiscent of private interactions, but both old and new media have also contributed to making private and intimate events available for broader audiences (see, e.g., video clips on YouTube and Xtube). To this, one should add that what counts as “public” versus “private” is often dependent on the role and choice of the researcher vis-à-vis the object of inquiry. For instance, a conversation between a teacher and their pupil in a state school would remain private until a researcher/ethnographer observed it, reported it in a publication or conference presentation, and thereby made it known to a wider academic audience.

These liminal spaces at the intersections between public and intimate constitute one of the most important challenges for language ideology research. Too strong a focus on representations of language in media texts and policy documents may not give a full picture of language ideologies in contemporary societies. In fact, large-scale, societal “macro” discourses may fail to fully capture the social life of language (see Agha, 2007), a life which also involves the voices of those who are often the object of media firestorms but who can only be heard in more “intimate” contexts. And these are contexts which, unlike many media texts, are not easily accessible “with a click of the mouse,” but require more time-consuming involvement and negotiations on the part of the researcher.

For example, Jonsson and Milani (2010) have recently analyzed the ways in which a group of adolescents of multiethnic descent in suburban Stockholm employ a range of linguistic resources in school settings, from more standardized language to a variety of different youth styles. Whereas dominant media discourses in Sweden are often built on a dichotomy between “good” “standard Swedish” and “bad” “youth language,” some of the school interactions documented by Jonsson and Milani bear witness to a more complex reality, one in which adolescents do not just reproduce dominant beliefs about standard language versus youth styles, but also contest and subvert such dominant ideologies in mundane daily interactions. This might not be particularly new in light of Foucault’s (1978, p. 95) observation that where there is power there is resistance. What is more unexpected is that this is a form of agency that does not manifest itself in outright disagreement, but takes more subtle forms of parodic imitation and mimicry (see also Rampton, 1995; Blackledge & Creese, 2010). Interestingly, the young men in Jonsson and Milani’s (2010) study indeed employ standard Swedish as an index of being a good student, on the one hand, and youth styles as an index of unruly behavior. However, the usage of standard Swedish is not always serious but may be mocking. This leads the authors to conclude that the adolescents in the study are staging a Bakhtinian carnival that is “both critical of social order and complicit with it” (Wolfreys, 2004, p. 27). In fact, these adolescents skillfully mobilize the dichotomy between standard Swedish and Rinkeby Swedish, together with the associations related to them. The parodic keying of the interaction subtly disturbs this order, however, not least because parody is never sheer imitation of an original but “simultaneously change[s] the original through recontextualization” (Pennycook, 2007, p. 587).

Of course, one might wonder to what extent “local practice [can] challenge the hegemony of national and global policy” (Blackledge & Creese, 2010, p. 6). Whilst it was beyond the remit of Jonsson and Milani’s (2010) analysis to answer this question, what their study

clearly illustrates is that local practices not only challenge what Cummins (2008) calls the “two-solitudes assumption,” namely a widespread belief that languages should be learned separately and one after the other; these practices also question the very notions of “authenticity” and “linguistic ownership.” Analogous to the “drag performances” studied by Judith Butler (1990), the adolescents’ parodic usage of standard Swedish artfully unsettles a well-established language ideology according to which only “ethnic Swedes” are “authentic” speakers who own the Swedish language.

Moving Beyond Language: Current Developments in Language Ideology Research

Apart from engaging with the interstices between public and private spaces, research on language ideology and media discourse has recently foregrounded other important issues, one of which is the imperative to go beyond *language* (in the narrow sense of written and spoken codes), thereby incorporating and expanding upon recent theoretical insights into visual communication and critical multimodal discourse analysis (see in particular Johnson, 2007; Blackledge, 2010; Johnson, Milani, & Upton, 2010).

In this respect, it is useful to remind ourselves that “written texts in contemporary society are increasingly becoming more visual . . . , not only in the sense that newspapers, for instance, combine words with photographs . . . , but also because considerations of layout and visual impact are increasingly salient in the design of a written page” (Fairclough, 1995, p. 17). Without denying the importance of the visual in contemporary societies, Machin is of the opinion that it is not so much that communication is becoming more visual as that “the previously segregated role of the different semiotic modes has changed. Formerly, we used the different modes in isolation” (2007, p. 16). Taking an even stronger position, Kress and van Leeuwen proposed that “[l]anguage always has to be realized through, and comes in the company of, other semiotic modes” (1998, p. 186), concluding that “any form of text analysis which ignores this will not be able to account for all the meanings expressed in texts” (p. 186).

Against this backdrop, if we similarly want to account fully for the processes through which language ideologies operate in late modernity, we cannot afford to overlook the growing field of research into multimodality (Kress & van Leeuwen, 2006), that is, the dynamic interplay between the verbal, the visual, and other semiotic modes. Put differently, notwithstanding the particular theoretical and methodological approaches one might want to adopt, research on language ideologies cannot be confined to the “purely linguistic” elements of a text. For example, without accounting for the relationship between the verbal and the visual, it would have been impossible for Johnson et al. (2010) to unpack the different language ideological layers underpinning the home page of a BBC Web site (www.bbc.co.uk/voices) dedicated to celebrating the linguistic and ethnic diversity of the UK. By analyzing the home page of the Voices Web site through a multimodal lens, Johnson et al. (2010) demonstrate that the BBC tried to do justice to the linguistic and cultural *diversity* of the UK. However, while regional and local dialects have been foregrounded, multilingualism is notable by its absence. In fact, standard British English is the nearly exclusive linguistic code chosen for the verbal text—the only exceptions being a hyperlink in Welsh and a few dialectal lexical items. Moreover, despite the acknowledgment of regional variation with regard to the English language, an analysis of the maps on the Web page points to the visual prominence of (southern) England and the dialects spoken therein. Finally, in spite of the recognition of ethnic and racial diversity, there are no pictures of those who are commonly associated with multilingualism in contemporary British political and media discourse, namely members of “Asian”—that is, Pakistani, Indian, or Bangladeshi—minorities (see Blackledge, 2005).

All in all, Johnson et al.'s (2010) study not only illustrates how the BBC has chosen a monolingual voice together with a diverse but nonetheless unthreatening face to represent the UK on the home page of the BBC Voices project. From a theoretical point of view, this study also teaches us that without a serious engagement with the visual and other semiotic modes, it is difficult to tease out the complexity of language ideologies embedded in texts as produced in late-modern contexts. Indeed, this is one of the key challenges for language ideology research in the near future.

Language Ideology in a Language Classroom

JAMES W. TOLLEFSON AND MAI YAMAGAMI

This entry examines ideologies of language in language classrooms. The study of ideology seeks to uncover the hidden world of students and teachers to shed light on the fundamental forces that shape and give meaning to their actions and interactions.

Meanings of *Ideology of Language*

Interest in ideology as a central theoretical concept in the social sciences initially developed within Marxist and neo-Marxist theories of capitalist societies, which emphasized socio-economic class and sought to explain how the ruling class sustains its system of privilege and exploitation (Fairclough, 2010). Within such theories, *ideology* refers to hidden systems of domination and control that support the interests of the ruling class. Since the 1970s, many new approaches to ideology have emerged (Hodge & Kress, 1993). One area of research is the central role that language plays in political and social ideologies; this focus is common among many scholars who have little interest in what happens in language classrooms (e.g., Habermas, 1987).

Of more direct application to language classrooms are the equivalent phrases *language ideology* and *ideology of language*, which have at least two broad meanings. In one, they refer to specific sets of ideas and beliefs that individuals and institutions articulate and promote. An example is the *ideology of assimilation*, which is the belief that newcomers to a community should adopt the language variety and the cultural norms of that community. This meaning of the term is closely linked with language policies in schools, which are often rationalized with reference to beliefs about the importance of social unity (an ideology of assimilation) or the value of cultural diversity (an ideology of pluralism).

The second broad meaning of *ideology of language* is that the term refers to complex, often implicit cultural conceptions of language that are closely linked with social structure, social identity, and beliefs about what is “normal” and “natural” in human societies. Included here are conceptions of language held by sociolinguists and applied linguists, such as the rule-governed nature of nonstandard varieties. Researchers who adopt this second broad meaning of *language ideology* view systems of communicative behavior “as an enactment of a collective order” (Woolard & Schieffelin, 1994, p. 55); thus they seek to uncover hidden but widely shared and “commonsense” cultural notions about the nature of language and communication. An example of this concept of ideology is *standard language ideology*, which is a complex set of usually unconscious and unarticulated assumptions about the nature, status, and social value of different language varieties.

Institutional Approaches

Analyses of ideology differ in their emphasis on institutional or cognitive factors. Institutional approaches to ideology focus on systematic practices within institutions such as schools. A central concern of institutional approaches is how schools reproduce unequal social relations through educational policies and practices that legitimize particular groups and

2 LANGUAGE IDEOLOGY IN A LANGUAGE CLASSROOM

their forms of knowledge (e.g., the spoken language of the upper middle class) while subordinating other groups and their knowledge (e.g., immigrants and their languages; Bourdieu, 1991). For example, what classroom use for languages other than the prestigious standard may be permitted? Are students encouraged to develop literacy in multiple varieties or only the prestigious standard? Do assessments consider students' proficiency in their native language(s)? Such questions draw attention to institutional practices that may sustain educational and social inequalities.

Cognitive Approaches

Cognitive approaches to ideology (termed "cognitive-ideational" by Blommaert, 2005, p. 161) are exemplified by the work of van Dijk (1993), whose main concern is *social representation*. Social representations are a form of social knowledge, which includes beliefs, values, norms, and attitudes that are shared by members of cultural groups. In language classrooms, the social representations of teachers, students, languages, and language learning processes (such as *native speaker*, *Asian*, *the English language*, and *teacher*) shape the specific experience of individuals. For example, a white, middle-class, monolingual teacher's experience of hearing students speaking African American Vernacular English (AAVE) in a language arts class may be shaped by the school's dominant social representation of AAVE as, for example, a corrupt and incomplete version of English that is inappropriate in schools.

As this example suggests, an important type of social representation is *stereotypes*, which are inflexible categories that have the important social function of maintaining unequal social relations (Pickering, 2001). Many stereotypes about AAVE and other minority languages reinforce the socially subordinate position of their speakers. Cognitive approaches to ideology make explicit the processes by which these social representations are developed and spread, and the ways that they shape classroom practices; the aim is to investigate how social representations help to maintain unequal social relations, and ultimately how to change those social relations.

Some Ideologies of Language

This section examines several ideologies of language that have been identified in language classrooms, beginning with two approaches that emphasize specific sets of beliefs that are often articulated by teachers, administrators, and policymakers, followed by examples of implicit but commonsense assumptions about the nature of language in society.

Language as a Problem, Right, or Resource

An influential framework for classifying language policies, beliefs, and practices is Ruiz's distinction between three "orientations": language as a problem, language as a right, and language as a resource (1984). Although Ruiz called these *orientations* rather than *ideologies* of language, the framework focuses on both implicit, commonsense beliefs and explicit, articulated policies and practices, and thus it may reasonably be viewed as a distinction between three broad ideologies.

Language as a problem refers to concerns about multilingualism and language variation: cognitive difficulties facing bilinguals; psychological problems for language learners facing "culture shock" and alienation; social problems for groups who are cut off from "mainstream" society; and political problems for multilingual states facing ethnolinguistic conflict and concerns about integration (Baker, 2006). *Language as a right* refers to the view of language as a basic human right deserving legal protection, like race/ethnicity, religion, and national

origin. This ideology of language emphasizes the importance of protecting linguistic minorities from discrimination and ensuring that their right to use their native language(s) for a full range of purposes is legally protected. *Language as a resource* refers to the view of languages as individual and societal resources that must be preserved. This ideology is closely linked to policies that protect threatened languages and that promote second language learning and multilingualism.

Pluralist and Assimilationist Ideologies

Closely connected with the three orientations described by Ruiz are two competing ideologies of language: the ideology of assimilation and the ideology of pluralism. Often rationalized by a language-as-problem orientation, the ideology of assimilation underlies educational policies and classroom practices that promote L2 learning of the dominant language by immigrants and other linguistic minorities. The term covers a broad range of notions of assimilation, including structural (economic) assimilation, cultural assimilation, and political assimilation (Baker, 2006). In contrast, the ideology of pluralism promotes multilingualism, L1 language maintenance, and language rights. This ideology underpins multilingual classroom practices, L1 use in bilingual education, and social and economic rewards for multilingual language use.

These two ideologies are important because they represent the major ideological disagreement in many neoliberal states. Indeed, language policies and classroom practices may be distinguished with reference to whether they contribute to or undermine assimilation and pluralism amongst language learners.

Ideology of Variation

Many language classrooms evidence an *ideology of variation* (Cameron, 1995), which presumes a fixed, unchanging target language, with learners' deviations from the target assumed to be due to linguistic incompetence or carelessness. This belief in a nonvarying target language is an example of the *reification of language*, which refers to the belief that languages (e.g., Standard English) are "real things" (rather than abstract constructs) that exist apart from language in everyday life. This belief presupposes stable social groups and identities, defined, in part, by language. Thus "native English speakers" are presumed to constitute a stable, meaningful, clearly defined social group speaking a distinct, learnable language that can be described apart from the everyday linguistic behavior of its speakers. Similarly, "Standard English" is presumed to be a clearly defined "target language" toward which English-language learners should make progress. Within this ideology, language learning is defined as movement toward that target, and the instructor's authority in the classroom rests on (native-like) expertise in this target model.

Ideology of Monolingualism and Standard Language Ideology

Closely related to the ideology of variation is the *ideology of monolingualism* (Baker, 2006), which refers to the belief that a single language is more efficient than multiple languages for group communication and language learning. This ideology takes two primary forms. The first is what Lippi-Green (1997) calls *standard language ideology*, or "a bias toward an abstract, idealized homogen[e]ous spoken language which is imposed and maintained by dominant institutions and which names as its model the written language, but which is drawn primarily from the spoken language of the upper middle class" (p. 64). In other words, standard language ideology creates the illusion that a standard spoken language is based on a stable written variety, when in fact it is the language spoken by the upper middle class; thereby the ideology helps to maintain the dominant position of the upper

middle class. An example is the commonsense belief that communication is more efficient if everyone speaks a uniform standard language.

Many of the tools of classroom teachers are instruments of standard language ideology, including grammar books, dictionaries, and teaching practices such as error correction. Such classroom tools and practices, along with their associated beliefs, are so powerful that they often blind teachers and learners alike to the essential and ever-present value of variation. As Lippi-Green points out, variability rather than uniformity is normal and universal. Expecting everyone to learn and use the same standard variety is no more realistic than requiring everyone to be the same height: despite the apparently commonsense advantages of uniformity, linguistic variation (like biological variation) is an essential characteristic of all human societies and impossible to eliminate (Cameron, 1995).

A second form of the ideology of monolingualism is the emphasis on the use of the target language as medium of instruction in language classrooms, and the common practice of restricting classroom use of students' home languages, particularly stigmatized, "nonstandard" varieties such as pidgins, creoles, regional dialects, and working-class or "ethnic" varieties such as AAVE. Although a long tradition in language teaching insists that these varieties disrupt learning and delay target-language acquisition, classroom research over the past 20 years clearly demonstrates that using such varieties in class can aid L2 learning (Auerbach, 2000).

The persistent use of monolingual practices in language classes has the ideological function of limiting the status and use of minority languages, restricting educational opportunities for linguistic minorities, and sustaining the social representation of minorities as lacking the ability and motivation to learn standard varieties. Thus, although usually justified on pedagogical grounds, standard language ideology and the ideology of monolingualism in language classrooms help to sustain systems of social inequality.

Language as a Psychological Phenomenon

A core ideology of language that underlies many teaching practices and forms of language assessment is the belief that language is a measurable psychological phenomenon. Since the 1970s, the main focus of second language acquisition (SLA) research has been learner variables, such as age and language transfer, attitudes and motivation, the relationship between input and interlanguage output, and unconscious and conscious learning processes. Economic and structural factors (e.g., class) and discursive analysis are generally excluded from major SLA textbooks (e.g., Ellis, 1997; Gass & Selinker, 2001). Although SLA seeks to describe and explain how people learn a second language, and why learners vary considerably in their learning outcomes, the field largely ignores language status and inequality, as well as their underlying economic and social bases. Remarkably, the vast economic and social differences between, for example, working-class immigrants in elementary schools in Philadelphia and wealthy university students in Busan, South Korea receive little or no attention in SLA. In other words, major SLA theories emphasize individual psychological variables rather than social and economic ones, and thus learners themselves are implicitly responsible for their variable language learning performance. In this sense, the view of language as a psychological phenomenon is ideological.

Pedagogical Consequences

The ideologies of language described here have important pedagogical consequences. Most importantly, learners' output is evaluated by comparison to the standard variety; error correction, formal practice, and other techniques are adopted for reducing variation; and these practices are rationalized with reference to theoretical concepts in SLA, such as "interlanguage" and "fossilization," which also rest on these ideologies. The ideology of

variation also has consequences for language and identity: speakers of particular varieties are presumed to share a common identity as a result of sharing a single variety; and language learning is viewed as essential to sociocultural integration, a belief that underlies language policies requiring immigrants and others to learn dominant languages. The reification of language has implications for the status of code-switching and mixed codes in language classes, as many teachers, administrators, and learners accept the social representation of these phenomena as corrupt or incomplete languages.

While such practices are shaped by ideologies of language, practices also have a reciprocal impact on ideologies. Language testing is a particularly striking example (see Shohamy, 2006). Tests define the status and power of different language varieties: class tests, college entrance exams, and graduation exams that take place only in the standard variety make clear that one variety and its speakers have higher status and power than other varieties and their speakers. Such tests may reduce linguistic diversity, increase concern for correctness, intensify sanctions against speakers who violate rules of correctness, and restrict the social value of the home languages spoken by linguistic minorities. Indeed, language tests have an important ideological function: they are implicit language policies, they articulate linguistic priorities, and they determine the social meaning of language forms. Thus the practices of teachers and other institutional authorities are not only shaped by ideologies of language, they sustain and reinforce those ideologies, and thereby play a direct role in sustaining social inequalities.

Alternative Views: Language as a Discursive Process and Historical Construct

In the past 30 years, an alternative perspective to the ideologies of language described here has emerged: language as a discursive process and historical construct, not an empirical linguistic phenomenon. Indeed, sociolinguistic research reveals that so-called “standard” varieties are characterized by significant variation, and that many language learners acquire not a single standard variety, but multiple varieties including stigmatized and hybrid varieties such as ethnically marked dialects and mixed codes. The commonsense practice of assessing language learners with tests of idealized standard languages and judging learners as “failing” when they produce “nonstandard” forms disguises the reality that many learners produce multiple standard and nonstandard varieties; and some learners may never need to produce a standard variety (Rampton, 2006). In contrast to the belief that code-switching and mixed codes are problematic in language classrooms, a large body of sociolinguistic research describes these phenomena as purposeful, rule-governed, and highly complex characteristics of the language of advanced learners with high levels of linguistic ability (Myers-Scotton, 1997).

In contrast to many SLA theories, a growing body of sociohistorical, historical-structural, and discursive analysis has emphasized the social nature of language (Lin & Martin, 2005; Tsui & Tollefson, 2007). This alternative tradition places ideology at the center of analysis. Indeed, ideologies of language determine the social meaning of language. In Woolard and Schieffelin’s terms, language ideologies mediate (or link) “social structures and forms of talk” (1994, p. 55). Thus understanding classroom interaction requires careful analysis of the social meanings ascribed to language forms and to the underlying ideologies which ensure that those meanings reflect social hierarchies. For example, many speakers of AAVE do not produce final /t/ sounds when the preceding sound is /s/. “Test,” therefore, is pronounced /tes/. This stigmatized form is routinely corrected in many language classes, based on negative social representations of AAVE and common institutional practices that favor exclusive classroom use of the standard (target) variety. When white, upper-middle-class

speakers delete final /t/, as in “East” in the phrase “East side,” the t-deletion is neither corrected nor noticed. African Americans are also often corrected when pronouncing “ask” as /æks/, while upper-middle-class whites often pronounce “asked” as /æst/, always without correction. Explaining the different response to these forms requires ideological analysis: teachers’ responses are based not on linguistic “facts” or research on pedagogical effectiveness, but on the different social status and social representations of poor and working-class speakers of AAVE compared to white, upper-middle-class speakers of “Standard English.” That is, the social status and social meaning of linguistic forms (and teachers’ responses to the forms) are determined by the underlying ideologies of language that provide social meaning for the forms in real-life contexts.

Conclusion

Though usually below the surface and not apparent to teachers or students, ideologies of language are always present in language classrooms, providing social meaning to language forms and patterns of communication. Moreover, because ideologies of language are linked to other ideologies, a full analysis of what happens in the classroom requires a broad lens that encompasses ideologies of teaching and learning, of education, of nationalism and national identity, and other powerful determinants of form and meaning.

Language Ideology in the Discourse of Popular Culture

ANDREW MOODY

Although there are a number of different ways to define “popular culture,” Moody (2010) notes that there are three characteristics that appear to be common to most definitions: popular culture is usually associated with mass media (and especially “free” media like radio or television); popular culture is consumer-oriented in nature and frequently encourages consumers to become “fans” of performers, products, or genres; and popular culture—like most expressions of consumer culture—is increasingly characterized by globalization. Each of these characteristics of pop culture makes it an ideal place to explore language ideologies, which are usually understood to be “any sets of beliefs about language articulated by the users as a rationalization or justification of perceived language structure and use” (Silverstein, 1979, p. 193). According to Blommaert (2005), this notion of ideology developed from an emphasis within discourse studies arguing that “ideology cannot be attributed to one particular actor, not located in one particular site . . . but that it penetrates the whole fabric of societies or communities and results in normalised, naturalised patterns of thought and behaviour” (p. 159). To the degree that popular culture is designed to appeal to broad segments of society through mass media and mass consumption, the languages of popular culture represent and establish the ideologies that justify its use.

Language in popular culture, however, is usually neither spontaneous nor naturally occurring, but instead highly edited for consumer appeal. Nevertheless, Moody (in press) notes that a great deal of effort is spent within popular music—and likely other forms of popular culture—to ensure that language is “authentic.” Indeed, the commercial viability of popular culture may depend on the “authenticity” of the product, and this authenticity often includes “linguistic authenticity” (see Seargeant, 2005; Moody, in press). Therefore, to the degree that pop culture is deemed as “linguistically authentic,” the validation of language will both depend upon and highlight language ideologies. There are, broadly speaking, two channels through which language ideologies within the various discourses related to popular culture are most easily observed: within the *performative channel*, which examines the influence of language ideologies upon language choice in the production of pop culture artifacts, and the *affiliative channel*, which examines the reception and reactions toward language in pop culture artifacts. These two channels do not represent competing methods to examine language ideologies in popular culture; language ideologies in any particular instance of pop culture discourse can and should be examined simultaneously in both the *performative* and *affiliative channels*.

The *performative channel* focuses on the language ideologies that are incumbent within a specific or general pop culture artifact, or performance. For example, the performance of African American English (AAE) in “hip-hop” genres (i.e., rap, hip-hop music, movies, television shows, etc.) has been noted in a number of popular cultures where AAE is not spoken as a native language (e.g., in Korea see Lee, 2007; in Malaysia see Pennycook, 2003; in Tanzania see Higgins, 2009; and in the United States see Cutler, 1999). Similarly, Trudgill (1983) and Coupland (2001) both examine the influence of American English (AE) pronunciation in British pop songs and in DJ talk on English-language radio in Wales respectively.

Although these last two studies were both published before much of the theoretical discussion of language ideology developed later in the decade, each of the studies examines the sociolinguistic meanings that are expressed when performers in pop culture use language varieties that are not native to either the performers or the audience. The varieties, however, in each of these cases may be considered “authentic” for the style or genre of the performance—AE in early British rock music, AE in DJ song introductions, and AAE in hip-hop and rap—and the appropriation of the variety is sociolinguistically justifiable. These descriptions of language use in popular culture entail important analyses of language and identity and have been strongly influenced by Rampton’s (1995) notions of “language crossing” and “stylization.” “Crossing” occurs when a speaker uses an “out-group” language in communication with the “in-group.” “Stylization,” following early work by Hebdige (1979), involves “putting on” or appropriating another’s voice—frequently an ethnic or social dialect—with the effect that “utterances project personas, identities and genres other than those that are presumedly current in the speech event” (Coupland, 2001, p. 350). Because “crossing” and “stylization” are intended to be interpreted as performing alternative personae, they are situated in and reinforce language ideologies of the groups that observe the performances.

The second channel for the examination of language ideologies within popular culture is the *affiliative channel*. Whereas the *performative channel* examines language ideologies that are related to pop culture performances, the *affiliative channel* examines fan reaction to language used in popular culture. Two aspects of popular culture make this channel especially important for the examination of language ideologies: first, popular culture is largely driven by a marketplace that encourages consumers to evaluate performance and become fans; and second, the multimodal nature of popular culture encourages intertextual references between artists and fans. Park (in press) uses the *affiliative channel* to examine fan reactions to a South Korean actress’s English performance on an Internet chat site, noting that reactions “engage with English in television commercials within a highly complex field of social relations . . . and cultural practices.” Similarly, Moody (in press) examines the fan reaction to a Japanese pop music group’s performance and argues that efforts to legitimize the performance as an authentic linguistic representation are ideologically driven. By using both the *performative* and the *affiliative channels* to examine the authenticity of language, therefore, data from popular culture can be increasingly informative of language ideologies.

Language Ideology, Translation/ Interpretation, and Courts

ALAMIN MAZRUI

A domain that demonstrates a particularly high incidence of the interplay between language ideology and translation/interpretation is no doubt the law court. The linguistically embedded power relations that are integral to the interactional process between various parties in a law suit often become accentuated when meaning has to be mediated between two or more language varieties through the agency of a court interpreter. Contrary to the common belief that court interpreters are unobtrusive parties in the court process, they can make a significant difference in the outcome of cases partly because of the influence of the respective language ideologies they imbibe (Berk-Seligson, 2002).

Various definitions of language ideology have been proposed over the last three decades or so. These are summed up by Wolfram and Schilling-Estes who propose that language ideology is the “ingrained, unquestioned beliefs about the way the world is, the way it should be, and the way it has to be with respect to language” (Wolfram & Schilling-Estes, 2006, p. 35). Language ideologies pervade social life in all its dimensions “insofar as ideas about language rub off onto ideas about people, groups, events and activities” (Haviland, 2003, p. 764).

In any bilingual courtroom there are often several language ideologies that mediate the process of translation/interpretation. Prominent among these is the “verbatim ideology,” the belief that meaning can be transferred word for word from one language to another. The interpreter is expected to assume the persona of the litigant whose utterances (s)he is translating, often speaking in the first person, and the judges often have complete faith that what is being conveyed to them through this process is a direct equivalent of the words of the litigant. It is also not unusual for jurors to be expected to base their deliberations and conclusions on the translated text even if some of them are fully proficient in the source language. In his study, Haviland reproduces the following instructions that a court judge directed to jurors in a case he was adjudicating:

The translation of the Spanish language that you must rely on in the course of this case is that translation that is made by the court interpreter that will be translating the language as it's spoken from the witness stand . . . I don't know whether any of you, as I say, understand Spanish, but we don't want to get into a situation where we have some juror in the room saying, “Well, that's not what the witness really said, you know.” (Haviland, 2003, p. 769)

The expectation is that the jurors will exercise complete linguistic amnesia and accede completely to the interpretive authority of the court interpreter appointed by the court.

Another similarly prevalent language ideology that comes into play in the courtroom is the “national language ideology.” This is the idea that every “nation” has one language that is somewhat natural to it, one that gives it a distinct identity. In the USA that language is presumed to be English. In France it is French. When a French national is charged in an American court, it is assumed that there might be need for an interpreter and that interpreter should be proficient in French. It would seldom occur to the court official that

the French national could in fact be Arabic speaking with virtually zero competence in French. The administration of justice then can sometimes be delayed because the court, under the sway of national language ideology, fails to ascertain the linguistic background of the accused and is therefore not sufficiently prepared with an interpreter with the right combination of languages for a particular case. If it is an American who is charged in an American court, and that person happens to speak no English at all, there is always the risk of bias in the judicial process because from the outset the person's Americanness, and therefore his legal entitlements as an American citizen, are considered questionable at best. In the United States of America this ideology has received recurrent reinforcement from the "English Only" movement that has reared its head at different times.

There is then the "standard language/dialect ideology." Lippi-Green defines this as "a bias toward an abstract, idealized homogenous language, which is imposed and maintained by dominant institutions and which has as its model the written language, but which is drawn primarily from the spoken language of the upper middle class" (Lippi-Green, 1997, p. 23). The basic presumption of this ideology is that standard dialects are the proper media of the courts and that nonstandard dialects are not adequately equipped to cope with and convey the nuances of legal language. As a result, nonstandard speech of one language in a court of law is always translated into and recorded in the standard version of what is considered to be the official language of the court. Contrariwise, an interpreter will translate not into the nonstandard dialect, for example, but into the standard version of the language of the accused—even if the accused is not adequately competent in it.

Most courts throughout the world also espouse the mistaken belief that the written word is merely a modal replication of the spoken word. But, in fact, the two are bound by different "discourse cultures." The notion of presupposable truth arising from the kind of abstraction engendered by written communication, for example, is more difficult to attain in oral communication. Truth in the oral tradition is seen to emerge from the ongoing process of creative use of speech and from the ongoing force of rhetoric itself. When written law is rendered in oral form, in the same or a different language, the differences in "discourse cultures" are seldom taken into account.

The study of language ideology and court translation/interpretation has sometimes focused on the way in which the use of language in legal arenas not only restructures the relationship of interacting parties, but also contributes to the (re)construction of legal ideologies. Weissbourd and Mertz (1985), for example, have attempted to demonstrate that the subconscious reflection on language structure by native speakers and the structure of discourse in the courtroom can ultimately affect legal ideologies in a culturally circumscribed way.

In sum, then, prevailing language ideologies in society can impact on the process of court translation/interpretation in many important ways. And because of the ideological embeddedness of language, court translation/interpretation can sometimes contribute significantly to the (re)construction of legal ideology.

Language Ideology: Overview

PATRICIA FRIEDRICH

Ralph Waldo Emerson once said, "Language is a city to the building of which every human being brought a stone." With each stone we bring, we also carry a bit of our identity, our convictions, and ourselves. So building this city is not always the tidy process one might expect it to be.

That attitudes, worldviews, and sociopolitical phenomena interact in complex and rich ways with language comes as no surprise to applied linguists. Ours, in a way, is the business of exploring language in its messiest and most fascinating form: we dwell on the shape and role it takes when people actually use, modify, create, agree, and disagree over it as each of us carries his or her linguistic stone and attempts to put it in a place of prominence and importance in our proverbial city.

We, the authors and editors of the language ideology area, offer but a glimpse of this enthralling universe of values, beliefs, identities, and political stances that affect and are affected by language, be it through the way language ideology manifests itself in the classroom (LANGUAGE IDEOLOGY IN A LANGUAGE CLASSROOM), in the sphere of public discourse (LANGUAGE IDEOLOGY AND PUBLIC DISCOURSE), in expressions of popular culture (LANGUAGE IDEOLOGY IN THE DISCOURSE OF POPULAR CULTURE), or in translations at the courts (LANGUAGE IDEOLOGY, TRANSLATION/INTERPRETATION, AND COURTS).

We are also aware that the macro linguistic level of the nation-state (LANGUAGE, POLITICS, AND THE NATION-STATE) as well as the micro-level and everywhere in between can be highly influenced by the ideas and beliefs people hold about the place and form language should take. For that reason, we prepared entries about particular contexts of language use and some of the challenges they face. In this section, they are represented by reflections on ENDANGERED LANGUAGES IN CANADA and ENDANGERED LANGUAGES IN AUSTRALIA, the relationship between the idea of NATIONAL LANGUAGES AND ENGLISH IN INDIA, the ENGLISH-ONLY MOVEMENT, and the impact of standard language ideology on African American Vernacular (STANDARD LANGUAGE IDEOLOGY AND AFRICAN AMERICAN VERNACULAR ENGLISH) in the United States. We also discuss SPANISH STANDARDIZATION and ARABIC STANDARDIZATION, and issues of LANGUAGE AND IDENTITY IN AFRICA.

Because we want to give the reader an opportunity to bridge theory and practice in their own contexts—contexts which we understand might not be covered by the entries above—we also worked on texts that provide a roadmap to some of the most important and often discussed aspects of language ideology in our time. For example, we offer considerations on LANGUAGE AND GLOBALIZATION, LANGUAGE AND IDENTITY, NATIVISM, LINGUISTIC IMPERIALISM, LINGUISTIC LEGISLATION, and LANGUAGE ENDANGERMENT.

Language ideology issues also permeate and help shape our views of history and legacy and the place of the languages transmitted to us by previous generations. For that reason, we included two entries on heritage languages, one focusing on HERITAGE AND COMMUNITY LANGUAGES and another on language policy as it pertains to heritage languages (HERITAGE LANGUAGES AND LANGUAGE POLICY). We hope they will cause the reader to stop and ponder and then probe further into the importance of looking back as we look forward.

Finally, we wanted to include a couple of entries that would focus on our own practice as teachers and researchers. They are represented here by writings on the issue of NATIVENESS

2 LANGUAGE IDEOLOGY: OVERVIEW

AND LANGUAGE PEDAGOGY and the matter of IDEOLOGY IN RESEARCH METHODOLOGY. That we as professionals, albeit aware of its presence, also bow to our own ideological standpoint, should be a matter for continuous reflection.

We are aware that these are only a few of the many pieces of the linguistic puzzle that we want to assemble. Like our linguistic city, our knowledge base is always in construction. We hope these entries are enlightening and useful and that the readers gain as much from reading them as we did in writing them.

Language of Courtroom Interaction

GREGORY MATOESIAN

Introduction

The language of courtroom interaction provides an exciting context not only to the study of written and verbal language but also to the analysis of language as a form of copresent communicative practice that integrates language, bodily conduct, and other semiotic resources (see Goodwin, 1994; Manzo, 1996; Matoesian, 2010). Studies of courtroom interaction demonstrate how legal realities, sociocultural knowledge, and sociolegal power emerge in the details of situated action (Philips, 1998; Conley & O'Barr, 2005; Richland, 2008). Rather than being a passive vehicle for the imposition of either legal or cultural variables, language interaction constitutes the medium through which evidence, statutes, and identity are forged into legal significance. The following overview examines several main concepts in the study of trial interaction: speech-exchange system, question-answer sequences, and indirectness. It then introduces several prominent themes in current studies of language use in court, such as power, ideology, intertextuality, identity, and affect. The entry closes with a brief discussion of the applied policy implications of trial language.

A Distinct Speech-Exchange System

Courtroom language operates in a distinct speech-exchange system or speech event with differential participation rights based on institutional identity, a system of turn preallocation (Atkinson & Drew, 1979). In contrast to everyday conversation, attorneys ask questions while witnesses answer questions, and this discursive division of labor occurs not only through observable patterns of interaction but in participant orientation to violations or deviant cases, as illustrated in the following example (Matoesian, 2008).

Extract 1 (DA=defense attorney; AM=witness)

001 DA: You knew that you were going to be asked questions
002 only twelve hours ago. It was only twelve hours isn't that right?
003 (1.1)

004 AM: Yes.

005 (7.3)

006 AM: ((*slight head tilt forward and back at 7.0*))

007 AM: ((lip smack/alveolar click and head movement forward toward microphone with thinking face display at 7.3))

008 AM: I would like to complete my answer on uh:: the question (.
009 about (.) saying that Senat[or Kennedy was watching.

010 [((gaze moves to DA))

011 (0.9)

012 AM: ((*raised and sustained eyebrow flash with mouth open-close*
co-occurring with three micro vertical head nods))

013 (3.3)

2 LANGUAGE OF COURTROOM INTERACTION

- 014 DA: Uh::: (.) which question are you answering now:: miss:://
015 AM: You had asked me uh::: (.) yesterday (0.5) n'you also asked me
016 this morning (0.5) **about** my statement to the police

Notice in the above example how the witness (AM) waits for a lengthy pause in the defense attorney's talk before *requesting* permission to complete a statement from the day before. She does not merely continue the statement but requests permission, maintaining the defense attorney's (DA) institutional authority in the process. After the DA fails to respond (notice the 0.9 second pause), she produces a series of nonverbal actions consisting of a raised eyebrow flash and three micro head nods in an attempt to elicit an answer while still withholding continuation of her statement. When the DA responds, after a lengthy 3.3 second pause, we see two additional delay components prefacing his response: vowel stretching on utterance initial *Uh:::* and a short micro pause. And, finally, he responds not with an answer but with a question that reformulates her request as an answer to some prior question (line 014), thus maintaining the discursive division of labor in which attorneys ask questions while witnesses answer them. In this short exchange, we can see how both participants shape the contributions of one another and how multimodal activities (gaze, facial expression, and head nods) intersect with talk to shape the organization of the turn violation and mark it as a departure from institutional arrangements.

While attorneys and witnesses may manage institutional rules "internally," as in the above case, legal authority may manage it "externally." In everyday conversation simultaneous talk is managed by the participants (Schegloff, 2000). In courtroom interaction, however, there is a legal constraint that *may* serve to minimize simultaneous talk, as in the following instance.

Extract 2 (edited) (PA=prosecuting attorney; WS=witness; CR=court reporter; J=judge)

- 001 PA: What's the it?
002 WS: Patricia Bowman's account of the events that night
003 is a damnable lie
004 [
005 PA: So you're saying that she's a liar=
006 CR: = I can't- I- I can't- can't report over (())
007 (1.2)
008 J: Missuz Lasch (.) there's been no objection from Mr. Black
009 but there is one from Mr. Crane . . . And Mr. Crane speak up
010 if you can't report.

Here we can see how resolving simultaneous talk may function in the institutional demands of the court reporter to capture the proceedings for the record, and violations of that institutional requirement (the simultaneous talk in lines 003–005) may be resolved by judicial authority, a unique institutional signature of language interaction in the courtroom.

Questions and Answers

Although courtroom language operates as a question–answer preallocation system with a highly structured discursive division of labor, we need to treat questioner control as problematic, for, under closer scrutiny, this micro social organization reveals a contingent variation of discursive identities. That is to say, the institution is "talked into being" (Heritage, 1984) on a moment-by-moment basis in the concrete details of situated conduct, a process involving several issues.

First, courtroom interaction functions through distinct activity types (Levinson, 1992; Cotterill, 2003, pp. 91–125; Gibbons, 2003; Heffer, 2005), each with its own organizational dynamics, such as opening and closing statements (Cotterill, 2003; Hobbs, 2003), direct and cross-examination (Tiersma, 1999; Ehrlich, 2001; Hobbs, 2003; Eades, 2008), sidebar conferences, objection sequences (Matoesian, 1993; Hale, 2004), judicial instructions (Heffer, 2005), preliminary motions, jury deliberations (Maynard & Manzo, 1993; Manzo, 1996), plea sentencing (Philips, 1998), sentencing allocutions (Gruber, 2007), each integrating a number of communicative modalities, such as verbal, written, visual, technological, material, and multimodal. Courtroom interaction represents a speech genre that consists of a hybrid constellation of subgenres (Heffer, 2005) integrated into the stream of discursive activity.

Second, and with this point in mind, although courtroom examination may appear as a question–answer system based on institutional identity, when the attorney produces a question, it opens up an objection opportunity space that, once activated, aligns different participants (the judge and the attorneys) differential participation rights (one attorney speaks and then the other) and different speech activities (grounds for the objection, warrant for posing the question, etc.), and the outcome of that process affects the nature and logic of courtroom interaction. On the one hand, when an objection is sustained the relevance of the original answer is terminated and the witness does not respond to it; on the other hand, if the objection is overruled the questioner may transform the question.

As an illustration of *objection-mediated question–answer sequences*, in one 16-minute stretch of cross-examination of the defendant in the William Kennedy Smith rape trial in 1991 an objection was raised to over 60% of the questions and each objection was sustained. In one 3.5 minute segment, the defense objected to 10 consecutive prosecution questions, the judge sustaining all 10. At the end of the 10th ruling, the judge removed the jury to admonish the prosecuting attorney for over 15 minutes. Thus while the attorney produced questions, there were no answers.

Third, the fact that institutional structure organizes attorney–questioner and witness–answerer forms of participation does not necessarily mean that attorneys will only ask questions and witnesses only answer. Consider the following example.

Extract 3 (edited) (PA=prosecuting attorney; WS=witness)

- 001 PA: And you don't have any idea how she got those bruises?
 002 WS: If you're asking me how somebody might get bruises
 003 who's on a blood thinner I can give you any number of different
 004 reasons. She may have gotten them dancing (0.7) She may
 005 have gotten them chasing around a child (.) She may have gotten
 006 gotten them taking pantyhose off in the car . . .

In Extract 3 (from Matoesian, 2001), the PA produces an inference that the defendant caused the victim's bruises after a sexual assault. Notice how the defendant poses an *if*-conditional attributed to the PA, which he then proceeds to answer in hypothetical detail. However, the PA never asked the recalibrated question in line 002. Here we can see how a witness transforms questioner and answer roles, projecting his own question to which the answer can arguably be heard, creating a subtle shift in topic. Just because attorneys inhabit the structural endowed role of asking questions does not mean that witnesses only answer. While the attorney asks questions, witnesses may (a) provide answers, (b) project "virtual" questions that displace the attorney's question, and (c) produce answers that align with their virtual question—fostering the impression that their *response is a reply to the attorney's question*. Perhaps it would be more profitable for future studies of questioning

in court to focus on the metrapragmatic construction of participation rather than reify the institutional structure of question-answer sequences.

And, fourth, if this is so, another issue looms prominent. If institutional context is being produced on a moment-by-moment basis in the unfolding stream of discursive activity—if the institution is “talked into being” (Heritage, 1984)—then is the concept of speech-exchange system or any similar transcendent structure redundant in an explanatory sense?

Indirectness and Inference

Direct and cross examination of witnesses must be conducted in question-answer format, mirroring the legal-linguistic ideology that only answers from witnesses, not questions from attorneys, constitute evidence (once again, an observation seen not only in the overwhelming occurrence of questions but also deviant cases where the requirement is breached) (Atkinson & Drew, 1979). An implication of this syntactic constraint means that attorneys must mobilize an arsenal of semiotic resources to contextualize meaning, to map or translate illocutionary force and other types of situated activity—accusations, comments, evaluations, assessments, inconsistency, impeachment—onto corresponding locutionary acts. Moreover, since witnesses will rarely agree with direct accusations and other face-threatening acts in cross-examination, attorneys must often organize a series of questions to produce broader inferences that tarnish credibility and impeach testimony. While speakers in everyday conversation can express doubt about the veracity of claims through simple assertions like “Give me a break” or “That’s not true,” these would be considered argumentative and thus prohibited in court. Consequently, attorneys in the courtroom must impeach credibility and testimony by mobilizing presupposition, repetition, lexical choice, metaphor, voicing, prosody, silence, irony, and indirection.

By the same token, rather than conceptualize courtroom interaction as institutional constraint, researchers may consider how it enables emergent and creative opportunities for constructing blame, assessing moral character, and shaping legal reality. In the Kennedy Smith rape trial, for instance, the defense attorney used lexical strategies (Cotterill, 2003) to create indirect inferences about the victim’s moral character and sexual history by referring to her ex-boyfriend as “your daughter’s father,” even though such history is formally prohibited by legal statutes. Similarly, in the O. J. Simpson trial, the prosecution referred to Simpson as an “abusive husband” whose violent pattern escalated to the murder of his wife while the defense referred to these as “isolated incidents” of ordinary family disputes (Cotterill, 2003). Both the above examples echo Danet’s (1980) classic study of the manslaughter trial of a Boston abortion physician, in which the prosecution used the term “baby” while the defense used “fetus” to contextualize salient presuppositions about the main point in issue. In all these cases, lexical strategies function as inferential frames of meaning (Drew, 1992; Eades, 2008).

Detailing to death represents another form of indirectness in which a series of short, factual questions constructs evidence cumulatively over time so that the fact in issue assumes a level of striking importance, as in the following.

Extract 4 (edited) (DA=defense attorney; AM=witness)

001 DA: So you went into the house (0.5) is that correct.

002 (0.8)

003 AM: Yes.

004 DA: Into the hou::se (.) where the rapist is (0.7) right?

005 (2.0)

006 AM: I guess you could say that yes.

- 007 DA: It's dark in there?
 008 (1.2)
 009 AM: Yes.
 010 DA: You go through the kitchen right?
 011 (0.6)
 012 AM: Yes.
 013 DA: Into this little hallway?
 014 (.)
 015 AM: Yes.
 016 DA: It's dark in this hallway, isn't it.
 017 (.)
 018 AM: Right.
 019 (.)
 020 DA: You meet up with this man who your friend says is a
 021 rapist isn't that correct.
 .
 .
 026 DA: And you ask the rapist to help him- (.) help- (.) you ask
 027 the rapist to help you find her shoes (0.6) is that correct?
 028 AM: I was not afraid of him (.) No I was not afraid of him
 029 DA: That's not my question Miss Mercer. You understand my
 030 question? . . .

In its entirety (not provided here), this segment consists of over 40 question-answer sequences for over four minutes, in which the defense attorney suggests that the witness neither believes her friend was raped nor the defendant is a rapist because a woman (AM) would not go into a "dark house" and "dark hallway" containing a rapist, ask the rapist to help her search for the victim's missing shoes and then look for the shoes with the "rapist" for 10 minutes—indirectness that evokes sociocultural inferences about sexual violence and gender relations. In such instances, each question functions as an integral link in an extended series of questions and derives its meaning not from syntactic form but from gestalt-like relations with other questions.

Power, Ideology, Identity, Intertextuality, and Affect

Power, ideology, identity, intertextuality, and affect represent several of the most important concepts in both social science and the humanities, and courtroom interaction supplies a rich environment for their empirical grounding.

Power

The *language and power school* (Conley & O'Barr, 2005; Travers, 2006) of legal anthropology emphasizes that power—the ability to make one's account count (Giddens, 1976)—must be negotiated in the concrete details of situated conduct. It cannot be "read off" from social structure or correlated with aggregate outcomes of behavior (Komter, 2000).

To illustrate, in Extract 1 above we observed the witness attempt to take over the turn-taking system to develop her topic. And the defense attorney may have gone along to avoid the impression that he was trying to preempt relevant testimony. But while he allows her to clear up the inconsistency from the prior day's testimony—as she appears to wrest control of the turn-taking system—he makes her "pay" a steep price for the transgression under the guise of granting her request. The extract unfolds as follows.

Extract 5 (edited; continuation of Extract 1)

- 001 AM: *I would like to complete that answer for the jury please.*
 002 (0.9)
 003 DA: *You mean this is an answer that I asked you yesterday you*
 004 *now after thinking about it overnight want to complete the*
 005 *ah:: answer//*
 006 AM: *Ah:: No. I didn't have the opportunity to answer your*
 007 *question yesterday ((staccato delivery))*
 008 DA: *I'm sorry I thought you had uh:: completed your answer.*
 009 *If you want to say something to the jury that you've had*
 010 *time to think about (.) please go ((lower volume))*
 011 AM: *No- it- >I haven't had time to think about it.*
 012 *I would have said the same thing yesterday when*
 013 *you asked me.< ((Sped up with increased volume))*
- .
- 022 I had asked her (.) uh few questions (1.7) Uh::
 023 she repeated (2.5) th- that *he was watching, he was watching*

Here we can observe several dimensions of power negotiation in court. First, the DA enacts evidential authority to shape the epistemological criteria for gauging the truth of utterances; utterances that are planned beforehand are evidentially and epistemologically “contaminated” and constitute inferior forms of knowledge (lines 003–005 and 008–010). Second, in the process, he mobilizes a legal-linguistic ideology or folk rationalization about how language works (Silverstein, 1993). In this instance, truth equals spontaneity in the here-and-now questioning, and these are the only utterances that possess epistemological authority. And, third, he produces a strikingly nimble inference that the witness not only spent a good deal of time “planning” her testimony but rehearsed it with her attorney the prior evening.

Erving Goffman's concepts of footing and participation are useful ways of considering power. Goffman (1981) introduced footing to refer to speakers' relationship to their utterances, how they signal who they are and what they are doing in the talk. The animator verbally produces the words, the author composes those words, and the principal authorizes the production of those words. As we saw previously, participation refers to the discursive division of labor among those in copresent interaction, but it may also designate a historical circulation of relevant yet physically absent voices imposed on the pragmatic present (Irvine, 1996). In the fourth example of power dimensions, bearing Goffman's work in mind, the witness, according to the DA, is merely “animating” the words of her author-principal “coach”; her words are not authentic but “contaminated” by her attorney, whose participation role is relevant to assessing the intertextual status of her claim even though he is physically absent. In this case we can see power “in motion” and how negotiation in footing and participation construct a strategic form of contrived impression management rather than authentic and authoritative speech (see Hobbs, 2003).

And, fifth, his *if*-conditional in line 009 provides a metapragmatic frame for interpreting her forthcoming direct quotes in line 023 (*he was watching, he was watching*), shaping their epistemological status, making them appear “rehearsed,” along with the negative inferences that permeate such testimony. Just as important, the study of legal discourse and the interactive processes of power embedded in it provide empirical grounding of traditional linguistic concepts. In this case, we can see how quotation is not an autonomous linguistic object in which grammatical structure drives epistemic and evidential value but a thoroughly interactive and power-driven coconstruction.

Ideology

The above points should not discount the role of ideology and domination in courtroom language, for, as many observers have noted, following Giddens (1984), meaning functions as a structured form of domination (Hirsch, 1998; Ehrlich, 2001; Conley, 2006; Eades, 2008). How macro social facts relate to microprocesses of courtroom interaction serves as one of the most contentious dilemmas in the field. Those who study courtroom language, however, find a balanced accommodation to the tension by analyzing how dominational structures infuse interactional processes and how interactional processes simultaneously possess contingent relevance to structural patterns (Dingwall, 2000). A major contribution of studies of language in courtroom interaction to linguistics in particular and social science more generally has been to shift analysis from claims based on aggregate data, statistical patterns, and philosophical arguments (or advocacy claims) to the methods in which participants ground ideology in the concrete details of situated activities.

For example, Ehrlich (2001) and Matoesian (2001) illustrate how questioning practices in rape trials naturalize dominant ideologies that transform sexual assault into consensual sex. Ehrlich (2001, p. 78) shows how defense questioning strategies incorporate an "utmost resistance standard" in which victims fail to resist enough and thus "invite" the sexual assault, such as "you had a number of options here and you chose not to take any of them." In a similar vein, Matoesian (2001, p. 38) demonstrates how rape trials incorporate a "patriarchal logic of sexual rationality" as an interpretive template for assessing inconsistency, not as a generic juxtaposition of incongruous facts but as a dominational ideology in which male standards frame female actions as a reciprocal sexual interest in the man. Defense attorneys frame attraction or interest on the part of the victim as sexual interest, the way that men are interested in women, thus erasing female cultural standards and preferences, as in Extracts 6 and 7 below.

Extract 6 (edited) (DA=defense attorney; V=victim)

- 001 DA: And you were interested in him as a person?
 002 V: He seemed like a nice person.
 003 DA: Interested enough to give him a ride home

Extract 7 (edited) (DA=defense attorney; V=victim)

- 001 DA: And you were attracted to Bruce weren't you?
 002 V: I thought he was a nice, clean looking man.
 003 DA: He was attractive looking, correct?
 004 (.)
 005 V: Yes.
 006 DA: And basically when you left the parking lot that night all you
 007 knew about him was that he was a good looking man, right.

Another methodological point bears discussion here. While there is no *a priori* stance against quantification, studies of courtroom interaction generally avoid premature coding schemes and analyze instead the empirically grounded semiotic resources participants bring to bear on the contextualization of ideology. If language in courtroom interaction is an interactively emergent coconstruction then methods and data attuned to capturing dominational facts "in motion" are preferred over analytic categorization and *a priori* theorizing that "erase" the phenomenon.

Identity

Bucholtz and Hall (2005, p. 608) have noted that "the age of identity is upon us" and studies of courtroom interaction have turned this dictum into a vibrant research agenda (Hirsch,

1998; Ehrlich, 2001; Cotterill, 2003; Eades, 2008). Rather than consider identity as a passive attribute of individual personality or social fact, research in courtroom interaction focuses on how it emerges as a sociocultural phenomenon in discursive detail. Hirsch (1998) demonstrated how women in a Swahili Muslim divorce court indexed gender identity through vowel lengthening and emphatic stress. Ehrlich (2001) showed how defendants in rape cases remove their agency from the acts in question through agentless passives ("*our pants were undone*"). And Matoesian (2001) illustrated how a defendant in a rape trial indexed expert identity to provide a medical opinion on the causes of the victim's injuries (seriously undermining the prosecution's case), encoding epistemic stance through modal perfects even though he was not legally tendered as an expert (and only expert witnesses can give opinions; see Extract 3 above).

Intertextuality and Affect

Intertextuality refers to the decontextualization of historical speech and its recontextualization in the current speech situation (Baumann & Briggs, 1990), the evidential infrastructure of the legal order. Affect refers to the use of emotion in discourse (Wilce, 2009) or how, according to Ochs and Schieffelin (1989), "language has a heart." Affect makes evidence "come alive" via prosody, intonation, bodily conduct, text metrical structure, and paralinguistic components like laughter and crying. We have seen intertextuality intersect with power in Extract 5. Below we can see how intertextuality, in the form of a direct quote, interacts with affect to mark a violation of normative expectations. This is a short extract of the defense attorney's opening statement that includes a quote attributed to the victim after a sexual assault: *she calls Ann Mercer (.) and says (.) "I've been raped (.) come and pick me up."* The defense attorney animates the victim's voice in the reported clause without any intonational or paralinguistic marking, suggesting to the jury that this is an oddly stoic way to talk about the unsettling sweep of criminal events that had just transpired at the defendant's home. In so doing, we can observe how intertextuality and affect *construct* evidence, rather than accurately represent it (in fact, Mercer stated that the victim sounded "hysterical" over the phone).

Applied Implications

Although the study of courtroom interaction has provided a number of descriptive studies, it also functions in the application of macro legal change and evaluation of change over time. Language *as courtroom interaction* is the crucial variable for implementing and evaluating legal change. For example, research has demonstrated how defense attorneys routinely circumvent rape shield legislation—prohibition on introducing the victim's sexual history in the trial—through mundane use of linguistic devices (recall "your daughter's father"), but these crucial features of linguistic interaction were ignored by feminist activists and legislators when designing rape reform statutes. Recognizing the crucial import of linguistic interaction, Taslitz (1999) and other scholars utilized linguistic research to develop specific proposals for leveling the playing field in rape trials, such as the use of a neutral translator during cross-examination of the victim. Moreover, attempts to evaluate the impact of rape reforms have yielded inaccurate results because criminologists ignored how language organizes and shapes evidence, measuring instead residual outcome variables such as increases in reports, arrests, prosecutions, and conviction as operational indices of the effectiveness of legal changes. This "scientific" preoccupation with operationalization and quantification "loses" the phenomenon (Maynard, 2006) by homing in on the wrong variables for measuring rape shield legislation and for understanding how shield statutes affect the victim on the stand. If the language of courtroom

interaction is the major vehicle for shaping and interpreting legal realities, if “our law is a law of words” (Tiersma 1999, p. 1), then policy applications and evaluation impact studies must incorporate this sociocultural dimension of law.

Language of Jury Instructions

BETHANY K. DUMAS

Jury instructions, also called jury charges, jury directions, or simply instructions, charges, or directions, are the legal guidelines provided by judges to jurors at trial, civil and criminal, usually at the conclusion of all evidence. Their function is to instruct juries in how to reach decisions or findings of fact based upon the evidence presented. Jury trials are distinguished from bench trials, in which judges make all decisions. Jurors are the triers of fact in jury trials, and their decisions must be based on the evidence presented at trial by following the law that is provided in the instructions. Thus the communicative effectiveness of the instructions is crucial to a fair trial. Jury trials are not used in all countries today, but they are used, in both civil and criminal cases, in most adversarial or common law jurisdictions: Britain (though not Scotland), Continental Europe, the USA, Canada, Australia, and New Zealand, as well as a few other countries (those influenced by colonialism). Jurors must make decisions by deciding which witnesses are believable, which ones appear to be telling the truth, and how much weight to give to testimony—all in the context of the legal rules that specify exactly how to apply the law to the evidence. Jurors make decisions about blame and guilt, and degrees of blame and guilt, based on the evidence that they have heard and the instructions that they have received. Because the instructions must explain relevant law, they must contain some legal language. Legal language has long been recognized as difficult for nonlawyers (Mellinkoff, 1963; Steele & Thornburg, 1988; Tiersma, 1999), and jury instructions can present special difficulties because of their linguistic complexity and length, sometimes hundreds of pages. They may contain definitions of special legal terms like *mens rea* (criminal intent) and *res ipsa loquitur* (“the thing speaks for itself”). Comprehension difficulties faced by jurors are well documented, particularly in the USA, where as early as 1979 (Charrow & Charrow), empirical research demonstrated that long, complex sentences and certain grammatical structures as well as specialized terms created severe difficulties for jurors. Some reform efforts have succeeded in improving comprehensibility, but there is consensus among linguists and other social scientists, as well as many judges and lawyers, that jury instructions used in most adversarial or common law jurisdictions need further improvement. This entry briefly describes the nature of jury instruction in the courtroom, traces the history of jury instructions and reform efforts, then illustrates comprehension problems and summarizes needed revisions.

Nature of Jury Instruction

Some researchers have suggested that serving as a juror for the first time is like trying to complete a semester-long law school course in two weeks. One highly acclaimed product of such thinking is the somewhat satirical, highly persuasive video *Order in the Classroom*, a 3-minute 28-second production that presents a dramatization of what a college classroom might be like on day one if the professor introduced the course to students as if they were preparing to serve as jurors. The professor tells the students that they cannot take notes or ask questions, that they will not be told what the course is about or how long it will last, and that there is to be no discussion. The purpose of the exercise is to identify problems inherent in the jury trial system, and the looks of confusion and shock on the faces of the

2 LANGUAGE OF JURY INSTRUCTIONS

students as they listen to the prohibitions are evidence that the problems are real.

But the major problem with jury instructions is that they often mirror the language of statutes or appellate court opinions, documents intended to be interpreted and used primarily by individuals trained in law, not individuals who have no legal training but who are expected to follow the law. Jury instructions constitute a different legal genre.

Most people are introduced to written genres early in life, often in literature classes where they learn to recognize differences among such texts as short stories, essays, novels, and sonnets. Eventually most people encounter nonliterary written genres also—contracts, for instance—but they do not necessarily think of nonliterary types of text as belonging to different genres. This is particularly true in law, in the practice of which individuals must follow fairly strict rules about format, organization, and vocabulary—and even sentence structure. Legal theorists have long recognized the close relationship between law and language, but once first-year law students learn enough of the strict rules—the “cant” as Philips (1988, as cited by Mertz 2007) calls it—to put them into practice, they often forget how difficult it was to learn enough of the special language rules to be able to “think like a lawyer,” arguably the most important knowledge acquired in law school. Mertz suggests that “some would associate thinking like a lawyer with superior analytic skills . . . ; I would instead characterize the acquisition of lawyerly thinking as an initiation into a particular linguistic and textual tradition found in our society” (2007, p. 3).

In court, the delivery of jury instructions often begins with a comprehensible paragraph or two, perhaps something like this in a criminal trial:

The evidence in this case has been completed and I will now instruct you on the law as it applies to the specific charges against [name of defendant]. The lawyers will then present their positions on why they think the state has or has not met its burden of proof establishing the guilt of the defendant beyond a reasonable doubt. The lawyers’ argument is not evidence. The evidence has come from the witnesses and the exhibits introduced during their testimony. After the lawyers present their closing arguments the court will instruct you on general principles of law and evidence that apply to all criminal cases.

Soon the judge will begin reading statutory language concerning the charges, and many pages of statutory language will be read aloud. Representative sentences will often be something like this (in a civil case):

“Exercise control over property” is defined as the right to direct how property, real or personal, shall be used or disposed. Generally, one must possess the right of possession in property in order to exercise control over it. Such possession may be actual or constructive, sole or joint. Also, one may have the right to control property without having a possessory interest. In such instances, if the defendant takes some action with the intent to deprive the owner of the property, and the defendant did so knowingly and without the owner’s effective consent, the jury would be justified in returning a verdict of guilty. Anyone who is in a position to take some action that deprives the owner of property is in a position to exercise control.

The instructions are often in the form of model or pattern instructions that have been approved by a state bar association or other professional group. Occasionally judges give instructions earlier during trial, also. For a long time, instructions were read aloud by the judge, but jurors did not receive printed copies of them. Increasingly, especially in the USA, jurors do receive printed copies and can follow them as they listen to the judge read them.

Jurors sometimes have questions about terms in the jury instructions. Trial judges decide whether questions can be asked and how they will be answered, and then often respond

to questions by reading the original instructions aloud one more time. This can be quite frustrating for jurors, who are never allowed to use such resources as dictionaries and encyclopedias. But increasingly judges are allowing questions and sometimes answering them substantively.

History of Jury Instructions

Modern juries evolved from early Western world use of tribal groups to investigate crimes, judge the accused, or both. Such procedures were used in Greece and in Germany, for instance, and in Anglo-Saxon England juries investigated crimes. During the reign of Henry II, the use of juries was expanded. Juries of presentment testified under oath to crimes committed in their neighborhood, and eventually such juries were used throughout the country. Such juries did not hear evidence or testimony in court, but relied on first-hand knowledge and less reliable sources. Between then and the present, forms of ordeal—procedures by which suspects were “tested” as to guilt—were sometimes used, though jury service was clearly in use by 1730, when the British Parliament passed the Bill for Better Regulation of Juries, an Act stipulating that a list of all those liable for jury service was to be posted in each parish and that jury panels would be selected by lot from these lists. That practice established the goals of impartiality and neutrality of juries. They have been used in the American judicial system since the 19th century (Schwarzer, 1981).

The pattern or uniform jury instructions used in most US jurisdictions today represent in most cases an attempt on the part of the drafters to state the law accurately so that impartial and neutral juries will be able to assist in ensuring justice in the legal system. Accuracy requires constitutional and statutory adequacy, but it does not necessarily require comprehensibility, and until recently such comprehensibility was not a primary goal of the drafters of jury instructions, pattern or otherwise. The pattern instruction movement became influential in the late 1930s, when the Judges of the Superior Court of Los Angeles published *The Book of Approved Jury Instructions (BAJI)*. Other jurisdictions (Washington, DC, Florida, Chicago, Nebraska, Colorado, and Utah) developed pattern instructions over the next two decades. Then, in the mid-1950s, the Illinois Judicial Conference recommended the drafting of accurate and impartial instructions in order to correct some perceived abuses, and the recommendation was carried out under the supervision of the Illinois Supreme Court. Following that, the highest courts of a number of US states followed the lead of Illinois and prepared their own pattern instructions. Currently, almost all US states have pattern instructions, though the extent to which their use is mandated varies (Nieland, 1979; Kelley & Wendt, 2002).

Pattern instructions were a step forward with respect to consistency and economy of time and effort; they served as readily available instructions so that individual instructions did not have to be prepared for every legal case. Their weakness is their form: they are written in dense, complex language and are often modeled upon appellate opinion language, language written by judges primarily for other judges to read. In general they are designed to be read, not to be heard by lay people listening to a judge read them aloud. The judicial appeal of mirroring appellate language is that it is unlikely to give rise to a reversal for error. Put simply, jury instructions full of legalese are unlikely to be reversed for error by appellate courts if they use the same language used by those courts.

Pattern instructions can sometimes be modified by agreement of the parties, often as a result of a charge conference (sometimes called a charging conference), during which the judge meets with counsel for all parties and outlines the instructions. Counsel may request changes, though the judge makes all final decisions.

Comprehension Issues and Needed Reform

In recent decades, some jurisdictions have taken a close look at problems in jury systems, particularly that of comprehensibility of instructions, and have initiated reform programs designed to increase comprehensibility and generally improve the lot of lay jurors. Such reform efforts are based on empirical research that began in the 1970s with attempts to identify which parts of instructions caused comprehension problems (Strawn & Buchanan, 1976). Some early studies tested whether and how juror comprehension could be improved by rewriting (Elwork, Sales, & Alfini, 1982), but it was the pioneering work of Charrow and Charrow (1979) that first empirically tested specific linguistic features that caused comprehension problems. Additional research by Steele and Thornburg (1988) and reform efforts since those early studies have often resulted in revised instructions that are far more comprehensible than earlier versions. Some major studies today are those by the National Center for State Courts (Munsterman, Hannaford, & Whitehead, 1997), California (Kelso, 1996, California's Jury Education and Management Forum), the District of Columbia (Council for Court Excellence, District of Columbia Project, 1998), New York (New York Jury Project, 1994), and Arizona (Dann, 1993). The American Bar Association Section of Litigation Jury Innovation Project is very active in general jury innovation, as is the American Bar Association Commission on the American Jury Project. Two jurisdictions, Arizona and California, have made sweeping changes in their jury systems, including revision of instructions. Tennessee has implemented a number of changes based on the recommendations of a Jury Reform Commission (Report of the Tennessee Bar Association Commission on Jury Reform, 1999) and is continuing to consider suggestions (Cohen & Cohen, 2003).

But even where reform efforts have improved comprehensibility, jurors must still often endeavor to understand instructions that are written in lengthy sentences that contain highly specialized vocabulary items and that often contain the kind of broad and abstract language that is often and necessarily appropriate for statutes that can apply to many different scenarios. Jurors, as Tiersma (2006) points out, do not need a list of abstract legal principles; they need to know what steps they should follow in order to reach a verdict. Jurors also need to be given instructions that contain understandable vocabulary items. Interestingly, technical legal terms, terms like *mens rea* and *estoppel*, are less a problem than some other terms, partly because they are seldom used. When they are used, jurors recognize them as specialized terms, and they tend to ask for—and only occasionally receive—definitions of such terms. More troublesome are “sound-alike” phrases such as *proximate cause*, which may be taken to mean *approximate cause*. The phrases are almost opposite in meaning; the former means “legally sufficient to result in liability,” while the latter means something like “closely resembling.”

Jury instruction text is not the only factor affecting comprehension. Methods of delivery and timing of delivery must be considered (Dumas, 2000a, 2000b), as well as “psychological issues in jurors’ understanding and acceptance of instruction” (Lieberman & Sales, 1999). One way to assist jurors is to tell them exactly what they are going to hear before they hear all the details. A roadmap, a list, or diagram telling jurors where they are headed and by what route that can expect to arrive there can provide an outline of jury instructions prior to their being delivered in full.

Explaining abstract legal concepts such as *proximate cause* can be helpful. Explaining such abstract terms adequately is difficult, partly because instructions must not in any way involve facts of the case at issue, but paraphrase and narrative examples can sometimes be useful. One might, for instance, explain *proximate cause* by comparing an accident caused by driving a car that has bad, or slick, tires with one caused by the negligence of a driver behind one:

It is possible for a person to be negligent without that negligence being a proximate cause of the accident. If the driver of that car with bad tires is stopped for a red light and is struck in the rear by another car, obviously the bad tires had nothing to do with the accident. In other words, the driver's negligence in driving a car with bad tires was not a proximate cause of that accident. (Dumas, 2006, p. 147)

A short list of matters needing attention as jury reform efforts continue includes the need for a clear introduction to the instructions (outlines, roadmaps), revision of complex sentences, adequate definitions of terms, and clear and effective time and delivery of instructions.

Conclusion

Several decades of empirical research tell us that legal jargon is neither the sole nor a major source of incomprehensibility in jury instructions, long known to present problems to jurors, though it can present special problems (*proximate cause*, *stipulate*, *mens rea*, *beyond a reasonable doubt*, etc.). The textual problems are sentence structure and grammatical constructions such as nominalizations, vague or unusual prepositional phrases, doublets, especially of legal terms, and passive constructions, particularly in subordinate clauses. Other problems include presuppositions underlying jury instructions in opposition to the presuppositions underlying attorney strategies, the nature of the task, the highly abstract nature of the instructions, and the mode of delivery of the instructions. Remedies are available: simplify sentence structure; paraphrase difficult concepts; add examples and narratives to the pattern instructions; answer jurors' questions; and give jurors written copies of comprehensible instructions. Reform activity has been highly effective in certain areas and in some jurisdictions. For it to continue effectively it must find a way to balance the jury's role as finder of fact with requirements of legal procedure, particularly those implicating constitutional issues, and also with the judicial perception that the jury must be highly constrained and controlled. In the courtroom, the judge is the domain expert on law and procedure, and the jury serves as trier of fact. To be effective, jurors must be able to have the freedom to seek additional information and explanation occasionally and to be instructed in language that is reasonably clear and complete. As Tiersma (2006) makes clear, success in creating and using comprehensible jury instructions will have at least three positive results: faster deliberation time, hence more efficiency at trial; a greater sense of satisfaction by jurors; and improved jury verdict quality.

Language of Police Interviews

KATE HAWORTH

Interviews conducted on behalf of institutions have long been recognized by linguistic researchers as important sites of social interaction, and few have such significant consequences as interviews conducted by the police in the course of a criminal investigation. Alongside the high-stakes nature of the interaction on the personal level of the interviewee, they are also a socially significant site of direct contact between the institutions of the police, the legal system, and the state, and the individuals whom they control and protect. This therefore represents a particularly fascinating and important area of linguistic study, which has been analyzed from a wide variety of methodological perspectives. Key aspects of interest are issues of power and dominance, question types and questioning strategies, the creation of records of interview interaction for later use in the judicial process, historical miscarriages of justice connected with the falsification of interview records, interviews with vulnerable groups such as children or speakers of different languages, and the communication of rights.

It is important at the outset to distinguish between interviews with witnesses and with those suspected of committing an offense. Although they share many general features, there are also important differences, especially in procedure. Witness interviews will be mentioned below, but since the majority of linguistic attention has been paid to suspect interviews, they will be the main focus here.

It is also important to appreciate that different legal jurisdictions have different procedures for interviewing suspects, leading to significant interactional differences. For example, unlike the adversarial common law system of the UK, USA, and most Commonwealth countries, the continental European (Roman law) system is inquisitorial, and is based on written documents rather than oral evidence. Thus the police interview with a suspect is intended to produce a written monologic summary drafted by the police interviewer, a process which is discursively managed during the interview and forms a considerable proportion of the interaction (Komter, 2006). This makes such interviews interactionally different to, for example, interviews in England and Wales, which are audio recorded, with the recording itself becoming evidence. Other common law jurisdictions such as the USA do not routinely record interviews, again providing a different discursive dynamic. However, although comparisons across jurisdictional boundaries can therefore be problematic, there are still many similarities across all researched jurisdictions in the features identified as typical of police interview interaction.

Procedure

Interviews with suspects (and witnesses) will be conducted by members of the police force as part of the initial information-gathering phase of a criminal investigation. In the vast majority of jurisdictions, the police may only interview a person before they have been charged with an offense. The interview therefore represents a relatively small window of opportunity for direct interaction between the police and their suspect; hence its procedural and discursive significance to all involved.

Police interviewing is governed by a strict framework of legislation, rules, and guidance. This complex, but invisible, set of restrictions and requirements is responsible for shaping every police interview. This framework is entirely familiar to police interviewers, and will guide their behavior at all times during the interview as part of their institutional function. But the suspect interviewee is highly unlikely to have any such knowledge. They are thus to some extent unaware of the underlying “ground rules” of the interaction. There is generally an obligation to provide interviewees with certain information about this framework, although whether this can be adequately understood, processed, and acted upon by an interviewee during the interview is another matter.

Interviews therefore generally follow a typical set structure (see Heydon, 2005, which identifies a “tripartite framework” for Australian police-suspect interviews). The opening and closing phases will normally be governed by procedural requirements, such as confirming factual details and providing the interviewee with specified information, including their rights. For the police, effective communication of their rights to any person who comes into official contact with them is a vitally important discursive function, and yet an extremely difficult one to achieve. This is the subject of extensive analysis in Rock (2007). A number of other studies have also identified serious problems with the communication and invocation of rights in the police interview context, including several relating to the England and Wales caution and the US “Miranda” warning. These are warnings which must be given at the opening of every police-suspect interview, and which advise interviewees of the consequences of what they subsequently say (or fail to say). It is incumbent on interviewers to establish that the interviewee has actually understood the meaning of the caution. This is clearly not the easiest of tasks, and, as demonstrated by Cotterill (2000), there is room for considerable doubt as to whether interviewees are sufficiently capable of absorbing the full import of these warnings in the circumstances, and manner, in which they are relayed to them.

Purpose

The ostensible purpose of the police-suspect interview is to obtain, and test, the interviewee’s own story. However, the interview’s subsequent role in the judicial process is such that “instead of a search for truth, it is much more realistic to see interviews as mechanisms directed towards the ‘construction of proof’” (Baldwin, 1993, p. 327). Interview interaction will be recorded in some form (see below), and that record will subsequently be used by several interested parties: by the police in conducting their investigation, by the body responsible for bringing prosecutions in deciding whether or not to bring criminal charges against the interviewee, and then by lawyers for both prosecution and defense in preparing for a court hearing. The interview record will then form part of the package of evidence presented to the court, on the basis of which the court will reach a verdict and/or decide on an appropriate sentence. It is therefore a key part of the interviewer’s institutional function to obtain information during the interview which is relevant to the legal framework of the criminal offense(s) involved, in order to meet the requirements of these subsequent users.

Yet at the same time as meeting these future requirements, the interviewer must also maintain the local interaction with the interviewee in the immediate context of the interview room, and this can present particular discursive challenges for participants, who are effectively required to address several different audiences at once (see Haworth, 2010). This gives rise to discursive incongruities such as “silly questions” (Stokoe & Edwards, 2008), which are questions used by interviewers to elicit specific responses which, although apparently superfluous, will provide the evidence required for a criminal prosecution.

Such studies highlight the powerful influence of the interview's later role as evidence over the discourse of the police interviewer. Yet it is also clear that interviewees are considerably less well equipped to manage this aspect of the interaction. Interviewers will be fully aware of the precise elements of the offense which need to be established, and of the interview's future evidential function, whereas interviewees are (generally) not. This is therefore another fundamental aspect of police interview discourse of which interviewees are to some extent unaware.

Power

It can be seen that, as with most interactions between representatives of professional bodies and lay individuals, a key feature of the discourse of police interviews is the relative power of participants. The very nature of interview interaction, where one participant is prescribed the role of questioner and the other that of respondent, means that an interviewer has considerably more control over what is said than an interviewee. This is particularly true of determining factors such as topic and relevance. When combined with the highly unequal power relations between the participants in a police interview, and the factors mentioned above, police interviewees can be seen to be at a potentially serious discursive disadvantage. This is especially true given that if an interviewee fails to mention details relevant to their defense there can be very serious consequences at any later trial, where such absences, and any inconsistencies between the account given at interview and that presented to the court, may well be interpreted as an indication of guilt. (There is, in most jurisdictions, a "right to silence" at interview, but this has been curtailed to some extent in England and Wales by s.34 Criminal Justice and Public Order Act 1994, and in any case it is impossible to legislate against the likely impact on a jury of such absences in a defendant's account.) This raises questions about the fairness of a system which sanctions interviewees for something which is, at least to some extent, out of their control. It also brings into question whether it is realistic to expect members of the police force to act as a neutral conduit in eliciting a criminal suspect's version of events.

The discursive influence of the interviewer over the account elicited from interviewees during police interviews has been illustrated by studies which have demonstrated how apparent confessions were in reality "dialogically constructed" (Shuy, 1998, p. 9), and how the prosecution version of events is privileged over the suspect's story (e.g., Heydon, 2005, pp. 116ff.). However, studies have also shown how an interviewee can achieve some degree of control over the interaction, albeit limited mainly to acts of resistance (e.g., Haworth, 2006; Newbury & Johnson, 2006).

Another key aspect, which is closely linked with issues of power and dominance, is the use of questions by police interviewers. Oxburgh, Myklebust, and Grant (2010) provide an overview of studies of questions in police interviews, and perform the useful function of bridging the gap between linguistic and psychological studies of this topic. While psychological research has tended to focus on quantitative categorization of different question types, especially the relative use of open and closed questions, linguistic research has generally taken a more qualitative (and critical) approach, revealing how different types of questions work to control the discourse (e.g., Gibbons, 2003, pp. 95–112).

Interviews with Vulnerable Groups

If police interviews represent a discursive challenge for the vast majority of interviewees, then this is even more so for those who are at additional disadvantage due to other factors. For example, for suspects whose first language is not that being used for the interview,

the need for the provision of an appropriate interpreter is not always even recognized, and the specific challenges facing interpreters in the police interview context should also not be underestimated (e.g., Russell, 2002). In addition to language differences, cross-cultural miscommunication can also be a serious problem (e.g., Cooke, 1996; Jones, 2008). In some jurisdictions special procedures do now apply to the interviewing of vulnerable groups such as children, or victims of certain crimes such as rape. However, the potential remains for serious disadvantage and injustice for such groups due to the highly challenging communicative circumstances of the police interview, and the potentially very serious consequences of anything said within this context.

Interview Records

A distinguishing feature of police interview discourse, and one which has been the focus of much linguistic interest, is the process undergone by the data subsequent to their production. As already mentioned, alongside the interview's important function as part of the initial investigation, it takes on an equally important subsequent role as a piece of evidence in itself. However, in order to be legitimately used as evidence, it is essential to be able to establish exactly what was said at interview. This is entirely dependent on the adequacy of the official record of the interview. However, the adequacy and accuracy of those records is open to considerable doubt. In fact, in stark contrast to the strict principles of preservation applied to physical evidence, interview interaction goes through significant transformation between its production in the interview room and its presentation in the courtroom. Since control over this process lies solely with the police and prosecution, this can be seen as a further extension of the control and dominance discussed above.

In many jurisdictions, formal written records of police-suspect interviews are produced by the interviewers themselves, in the form of a monologic statement or *précis* of the spoken interaction, often based on notes and memory alone. Several studies have shown the results to be poor representations of the interaction which actually took place (e.g., Jönsson & Linell, 1991, in Sweden; Gibbons, 1995, in Australia). The similar process used in England and Wales for the taking of witness statements has been found similarly wanting (Rock, 2001).

The inadequacies of official written versions can partly be attributed to fundamental differences between spoken and written language and the consequent difficulties of converting one format to the other. For example, an official police transcript will routinely omit details such as intonation, interruption, and pauses, which can be of immense significance to the interaction. However, the problems identified in the literature go well beyond basic representational considerations, with a disturbing amount of transformation and omission from the interviewees' version of events. It is surely not coincidental that the resulting accounts tend to prioritize the interests and agenda of the police. Some extreme examples of this are several cases in which linguists gave expert linguistic evidence of the falsification of interview records containing disputed confessions, such as the cases of Derek Bentley and the Bridgewater Four in England (Coulthard, 2002), and *R. v. Condren* in Australia (Eades, 1995).

Partly as a consequence of such high-profile miscarriages of justice, the audio recording of police-suspect interviews is now mandatory in England and Wales, and is increasingly being introduced in other jurisdictions. This has largely been taken to have solved problems with the accuracy of interview records, and is certainly a vast improvement, but in fact it raises some new problems of its own (Haworth, 2010). Tapes are often of poor quality, are transcribed by clerks with no training in the challenges of representing spoken language in written format, and are often selectively summarized rather than transcribed in full.

Further, in England and Wales these transcripts are then read out loud in court, providing a further source of transformation and distortion. The problems of accurately presenting police-suspect interview data as evidence are therefore still unresolved.

Language Planning and Multilingualism

RICHARD B. BALDAUF JR. AND CATHERINE SIEW KHENG CHUA

Introduction

Although multilingualism can be said to be the societal norm, and monolingualism the aberrant condition, classical language policy and planning (i.e., macro planning) has focused on the latter with the development of a single national language within each polity as its primary goal, i.e., the so called “one nation, one language” policy. However, despite such efforts very few polities actually exist where over 90% of the population speaks one dominant language. In the mid-1980s, Austria, Bangladesh, Germany, Iceland, Japan, Korea, and Portugal met this criterion (Laponce, 1987), but globalization has made a number of these polities more multilingual. Although languages in nation-states were seen to be territorial (Laponce, 1987) and in competition with one another, they developed to accommodate multilingualism. Even before colonization, globalization, and marketization became major factors in the migration of people, the spread of languages meant that some polities had or were planning for multilingual futures. Even in monolingual-oriented polities like the United States, which is not very supportive of bilingual education, approximately 18% of the population speaks a language other than English at home (Baldauf & Kaplan, 2010).

Macro or classical language planning can be defined as policies (statements of intent) and planning (indications for action) for deliberate, although not always overt, future-oriented change in language code or language behavior (or both) in a particular community. Individuals in any community may be characterized as being monolingual (knowing a single language) or bilingual (having competence in two or more languages). Societies that consist of a substantial number of bilingual individuals can be said to be multilingual. Thus, “language planning and multilingualism” is about plans, policies and activities that deliberately sustain or provide the conditions to develop substantial numbers of bilinguals in a polity resulting in or sustaining a multilingual society.

In recent years the growth of English as a world language has added a further layer of bilingualism to most non-English-speaking societies, although whether this growth has occurred through competition generated by colonialism, linguistic imperialism, or individual and national self-interest in a globalizing world is a matter of much ongoing debate. Thus, the classical definition of language planning for bilingualism resulting in multilingualism has become more complex as there has been a realization that the focus of what constitutes language planning and the reach of multilingualism needs to be expanded to include global and local issues. Global or supranational language planning is required to deal with international communication in a wide range of political, economic, and military organizations (Chua & Baldauf, 2011a). While this has implicated the need for planning for English in particular by various organizations and bodies, other languages like Arabic, Chinese, French, or Spanish are also substantially involved. Micro or local language planning is often what determines the success of macro planning (Chua & Baldauf, 2011b) and in some instances involvement at that level by small groups or individuals may be the only feasible way for planning to take place (Liddicoat & Baldauf, 2008). While both of these

types of planning for multilingualism are becoming more widespread and their importance is beginning to be recognized, discussion of them is beyond the scope of this entry. In the sections which follow, we examine what language planners know about planning for multilingualism, discuss some examples of multilingual polities, and suggest how language planning could affect multilingualism in the future.

Language Planning for Bilingualism

In classical language planning (see, e.g., Baldauf, 2005b), polity-level decisions about what languages are to be taught to whom for what purposes is a matter of status planning. Most often they are implemented through language-in-education planning (acquisition planning), although corpus planning (i.e., language-related issues) may be required to develop the language materials needed to implement the plan. The principles for conducting good status planning are well known, but they have rarely been put into practice. These principles are based around needs analysis, through the collection of *factual data*, *people's opinions* on present or future language performance and on *actual second language performance* (van Els, 2005b, p. 981). Tools such as sociolinguistic surveys can be used to collect data about language use as well to ascertain the degree of communicative competence required to meet particular individual and societal needs within a given polity. Van Els argues that where needs are communicative or language competence-related, planning for language learning is indicated, while more general cross-cultural social and intellectual skills may be better met through other types of teaching.

Beyond needs, there are a number of historical and current factors that influence choices made for successful planning for bilingualism. The internal (e.g., large minority language groups like Frisian speakers in Amsterdam) and external (e.g., neighboring Malay-speaking countries for Singapore) language situation in a particular polity influence which languages are supported. Educational factors including the availability of teachers, suitability of teaching materials, and adequacy of financial support are also critical if bilingual planning goals are to be realized. The failure of 40 years of bilingual Bangla-English policy implementation in Bangladesh provides an example of trying to do too much with too few resources in a polity where the immediate communicative need for English is not evident to most nonurban learners (Hamid & Baldauf, 2008). Understanding the needs and factors that determine the relationship between language planning and multilingualism can be best accomplished through an examination of specific examples, some of which take us beyond the notion of deliberate language planning to situations where policies are implied but no less real.

The examples that follow examine the introduction, development, and sustainability of bilingualism or multilingualism in selected polities highlighting personal, territorial, polity-wide, and global solutions for doing this. In language-planning terms, the personal is related to micro or local planning (e.g., in Australia); the territorial (e.g., Belgium, Canada, Switzerland) and polity-based (e.g., Singapore, South Africa) solutions are related to classical macro language planning; while broader planning (e.g., the European Union) is related to global language-planning efforts.

Macro Language Planning

Territorial Planning—Belgium, Canada, and Switzerland

Belgium is made up of three regions: Flanders, Wallonia, and the Brussels Capital Region with Dutch (Flemish), French, and German as official languages. In the multilingual Brussels Capital Region, the official languages French and Dutch are augmented by languages

such as Spanish, Italian, and English spoken by other Europeans residing in the city. Here, most of the Belgians are considered bilingual as they have some knowledge of the dominant languages of the capital (Leman, 1990). However, in the other two regions, Wallonia (which uses French) and Flanders (which communicates in Dutch), people are basically monolingual with each region running its own parliament and government. Only 19 Belgian municipalities are officially bilingual, 27 other municipalities are monolingual, and other cities, towns, or villages have one designated official language (O'Donnell & Toebosch, 2008). However, recently, language choice has shifted with English gaining in popularity due to Belgium being the headquarters for the North Atlantic Treaty Organization and the European Union. Although English is neither an official nor co-official language, the Dutch and French speakers in Belgium were found to prefer English to other national languages (O'Donnell & Toebosch, 2008), adding to the polity's territorial-based multilingualism.

Canada is a heterogeneous society that historically has been an immigrant country made up of Francophones, Anglophones, aboriginal groups, and other migrants. This has required bilingual and multicultural policies, and as early as 1867, the use of either English or French was permitted in Parliament and proceedings in the federal courts (Canadian Heritage, 2008). However, official bilingualism, which gives English and French the same status, rights, and privileges, was only implemented in 1969 while the multicultural policy was launched in 1971 (Edwards, 2005). In primary and secondary schools, Canadian children are taught in English or French depending on the province in which they reside (Department of Justice Canada, 2009). Together with the bilingual policy, multiculturalism is also celebrated. In regions with a high number of immigrants such as Ontario, there are over 100,000 students learning more than 60 languages (Edwards, 2005). However, these language policies have also created linguistic polarities. For example, in Quebec a large majority speaks French because the government has implemented the *Charter of the French Language* making French the sole language of the province. In neighboring New Brunswick, a large proportion of people speak English (Edwards, 2005) because English is taught to new Canadians as a second language to integrate them into Canadian society. As Canada has welcomed new migrants as a way to promote economic growth and cultural development, the linguistic structure has continued to evolve with an increasing number of Canadians speaking Mandarin rather than French outside of Quebec (Gallagher, 2002), meaning multiculturalism and not biculturalism increasingly characterizes modern Canada.

Switzerland is another multilingual country that has successfully managed its linguistic diversity territorially, having German, French, Italian, and Romansh as its four official languages. In the German-speaking cantons a classic diglossic society exists. Standard German is used in publications, media, literature, and local Swiss German dialects are used in everyday interactions (Swiss Federal Statistical Office, 2009), while individual preferences govern languages used in schools and churches. Despite this apparent diversity, in reality its people are not multilingual as only six percent of its citizens are able to converse in the four official languages and only a minority is effectively bilingual. As each Swiss canton is responsible for its own official language, monolingual territorial language borders are created that segregate the different speakers (Benini, 1999) while Switzerland operates under the guise of federal multilingualism. In recent years English has become the preferred second language as it is perceived by the Swiss to be a language associated with better economic opportunities (Stotz, 2006), and this is reflected in Swiss government Web sites where English is included together with German, French, and Italian even though there is strong constitutional support for the largest language, German (Swiss Federal Statistical Office, 2009).

These examples illustrate territoriality as a mechanism for sustaining different languages in multilingual societies. However, territoriality need not be as formal as in these polities as language policy support provided for Swedish in Finland or Catalan and Basque in

Spain demonstrates. Globalization has increased economic, cultural, and information exchanges between people, creating the need for greater communication. Facilitated by improvements in technology, speakers are learning dominant languages of intercultural communication, predominantly English, thereby increasing societal multilingualism.

Polity-Based Planning—Singapore and South Africa

One example of an English-speaking dominated multilingual society is Singapore. Language planning in Singapore is designed with the intention of creating a multilingual social structure that meets the political needs of that polity. The government has chosen to manage this pluralistic population through a model of multilingualism that compartmentalizes the population into four distinct categories—Chinese, Malays, Indians, and Others. Each category is assigned an official “mother tongue” language—Mandarin (Chinese), Malay (Malays), Tamil (Indians), and English (Others) (Chua, 2004). The foundation for this multilingual model is the English-knowing bilingual policy, where bilingualism is defined as proficiency in English as the first language and one of the mother tongues as the second language. The objective of the policy is to ensure Singapore’s economic advantage, to unify the different ethnic groups by learning English, and to maintain the people’s cultures by learning the mother tongue. Language planning has resulted in all Singapore government schools using English as the main medium of instruction and for all examinations, except for mother tongue subjects. In 1980, streaming was introduced to channel school students to different courses based on their linguistic abilities. Furthermore, English has been used as a gatekeeping device for local schools and universities (Chua, 2004). Recently, the multilingual model has further diversified as some secondary students (13-year-olds) are allowed to study an additional mother tongue or foreign language in addition to their mother tongue. To complement planning in the education system, the government has had an ongoing “speak Mandarin campaign” (primarily for the Chinese in Singapore), to encourage the use of Mandarin for cultural knowledge and to meet the increasing economic involvement with China, and have instituted the “speak good English” movement in an attempt to maintain the standard of English (Chua, 2004). Singapore’s multilingual model rests on communicative needs related to economic development; it is structured, well-planned, and has successfully improved literacy levels.

In South Africa, state-based language planning has to accommodate a variety of African, Asian and European languages—including Afrikaans, Arabic, Hebrew, and Sanskrit—creating a complex linguistic structure. From this diversity of languages, the government has selected 11 languages—Afrikaans, English, IsiNdebele, IsiXhosa, IsiZulu, Sepedi, Sesotho, Setswana, SiSwati, Tshivenda, and Xitsonga—as the country’s official languages with English as the country’s lingua franca (www.southafrica.info/). Language planning and policy in South Africa are closely linked to the country’s political history. Its multilingual policy was implemented in 1996 to replace the English and Afrikaans bilingual policy that existed during the colonial and apartheid periods when language was used for ethnic and racial segregation. During this period, the Whites, Indian and Colored children were educated in the two official languages while the Black Africans were taught in an African mother tongue for the first four years of their schooling before progressing to English-medium education (Murray, 2002). The new multilingual policy has been implemented using a top-down approach, similar to the strategy adopted by the Singaporean government, although South Africa is much larger and more diverse. It is filtered through the Ministry of Education to the provincial and regional levels, and is open and flexible, resulting in different interpretations and varied outcomes. However, in some respects a monolingual approach is dominant as English is used in all governmental work and is associated with greater economic opportunities. South Africa has attempted to put in place a more inclusive society in which multiculturalism and multilingualism are celebrated.

But, the association of African languages with apartheid has meant that the preference for an English-language education is pervasive, as for many Africans it is associated with a better chance in life.

Global Language Planning

Broader Planning—The European Union

Language planning in the European Union (EU) involves two opposing models. The first promotes linguistic diversity through its multilingual and pluralistic approach to language planning, reflecting the 27 members and 23 official languages in the EU, with each member state having the right to specify the language(s) that will be used as its official language(s) (Europa, 2008). Multilingualism is seen as the best way to maintain Europe's linguistic heritage and to eliminate discrimination, although there is still discrimination since regional minority groups such as the Catalans in Spain do not share the same linguistic rights (Faingold, 2007). This multilingual policy is supported through conference interpreters to deal with verbal communications and the translation of official documents.

Parallel to the multilingual policy, the EU also adopts a second language-planning model in which only a selected number of languages are used as EU working languages. In most situations, English, French, and occasionally German, Italian, and Spanish are used while the rest of the official languages are excluded (van Els, 2005a). Over time this language model has evolved and has become increasingly one-language focused, with English being nominated as the unifying language and lingua franca for all EU members. Such a move toward one overarching language is deemed to be practical as it facilitates efficient communication and is cost effective in a situation where an increasing number of countries are joining the EU. The EU is therefore caught in a constant struggle between the two models—one that promotes diversity and the other that advocates a convergent approach. This polarity is not unique, as other multilingual bodies such as ASEAN have also adopted English as their language for official communication.

Micro or Local Language Planning

Personal Planning—Australia

Although for a period during the 1980s and early 1990s Australia had a reputation for being a leader in educationally focused language planning for promoting and sustaining multilingualism, since the mid-1990s language policy has entered a period of relative neglect. These early policies were based at least in part on the needs-based approach advocated by van Els as a senate committee held hearings around the country and took written submissions on what the policy should contain. These policies lead to unprecedented Commonwealth support for European and, for the first time, for Asian languages being taught in schools and in community language programs (Baldauf, 2005a). Some support was also given to aboriginal languages by the Commonwealth and particularly by the Northern Territory, resulting in the revival and use of a number of languages, but declines in others (Nicholls, 2005). However, since this burst of support for bilingual activity, interest at the Commonwealth and state level has declined as governments have allowed a more laissez-faire policy to emerge. Although there are some signs that Australia is entering a new phase of activity (Liddicoat & Scarino, 2010), it is still the case that bilingual programs and study remain primarily an individual or language-community-based activity. More generally, the focus has remained firmly on English literacy in a world that many Australians might see as English dominant.

In instances where individuals or communities are given the option to choose, micro language planning provides two opposing choices. For those who focus on one preferred language such as English, the outcome is a more monolingual society evidenced by the large number of Australians who are monolingual English speakers. On the other hand, those who are bilingual, or who want to be so, make their own personal decisions to become involved in bilingual activities or programs. Other polities like the United States have also adopted this laissez-faire attitude, making language study an individual choice. However, as language use is a community-based activity such micro language planning alone, while essential for the health of language maintenance, is not sufficient to sustain multilingualism.

Combining the Solutions

In India, other parts of Asia, or in much of Africa, language planning for multilingualism is based on the “3 +/- 1” formula for language planning and learning. In some senses it combines aspects of the previously discussed multilingual solutions to language planning (Kamwangamalu, 2011). The “three languages solution” refers to the state (regional), national, and international languages that individuals must learn for social and educational purposes within a polity. For example, in the Philippines these languages might be Ilocano (or another local language), Filipino, and English. However, if a person were a Tagalog speaker, then they would only need to learn two languages as Tagalog and Filipino are very similar, while a Waray speaker living in an Ilocano community would need to learn four languages. Polity-based educational planning means education is bilingual in Filipino and English, while local languages are still territorial within the Philippines. Given the language choices available, individual choice is very important in the bilingualisms that develop, and the diaspora of Filipino workers and brides based on their English-language and educational skills has global language-planning implications.

Language Planning and Its Limitations—India

Although language planning consists of organized interventions in language problems, in some cases these attempts fail to materialize because governments are unable to introduce standardized action plans to carry out their policies. For example, the linguistic structure in India makes language planning challenging for the government. The different waves of colonization, interstate migration, political influences, race, culture, religion, and socio-economic status contribute to the complex sociolinguistic make up of India. The availability of newspapers and magazines in more than 90 different languages, over 70 languages being used for radio programs, and 13 different languages being used for movies and television programs illustrate India’s functional multilingualism (Annamalai, 2004).

Language planning began during the colonial period; English language schools were established to educate the local peoples with the European knowledge and values and to provide an English-educated workforce for the colonial government. By the 20th century under the leadership of Gandhi, the colonial government introduced the *diarchy* system in which major Indian languages were offered as an alternative medium of instruction in schools (Annamalai, 2004). After independence, language planning was based on the importance of indigenous languages, mother tongues and a national unifying language (Spolsky, 2004). In an attempt to address this complex language-planning situation, in 1963 the Official Languages Act, which follows a three-language approach, was introduced. The first approach is to ensure that English is used in business, official business, and in higher education. The second approach is to position Hindi as the official medium for communication and a language for national unity (Annamalai, 2004; Spolsky, 2004). The third

approach is to have primary school students study in a third language which is the language of the state they live in (Laitin, 1989). Nevertheless, problems arise when different states implement the policy differently. For example, in Nagaland all schools use English as the medium of instruction, whereas in other states they allow more than one language to be used in schools (Annamalai, 2004). While this policy caters for the great linguistic diversity found in India, the translation process of the policy at the state level creates great complexity and disadvantage for some. However, even when a language is used as the medium of instruction, this does not mean that the students will become proficient in it as the cases of English teaching in Malaysia and Hong Kong illustrate.

Conclusions

Macro language planning often has had a monolingual focus, that is, creating a national language to unify a polity in contrast with the dominant historical multilingualism and multidialectalism that naturally occurs in most polities. However, as the examples in this entry illustrate, a number of solutions have been found to sustain multilingualism. Indeed, a new wave of multilingualism has occurred through globalization that has broadened these multilingual tendencies in many parts of the world. While world languages such as English create diversity as they are added to the multilingual mix in a polity, these languages can also become so dominant that they threaten indigenous and smaller languages which exist within these multilingual societies. In Figure 1, language-planning relationships as they relate to the communicative needs found in a polity are displayed diagrammatically. This shows that while macro language planning has been one intended outcome, planned multilingualism has been another. It also recognizes that micro or personal choice is a significant factor in policy acceptance and development, as are global language structures that influence international communication.

The rise in interest in micro and global language planning and their impact on multilingualism is related to technology and the new wave of multilingualism that has seen the emergence of a new breed of speakers who are English-knowing or dominant bilinguals. Electronic communication and the increased use of electronic devices and related activities,

Figure 1 Relationships between language planning and multilingualism

such as e-mailing, e-learning, e-commerce and e-filing, has led to a new breed of users who could be called e-multilinguals, i.e., individuals who learn a world language such as English in addition to their native languages, so as to communicate more effectively in this electronic milieu where the World Wide Web and its search engines are dominated by the English language (Chua & Baldauf, 2011a). While the development of e-multilingualism may be seen as a trend toward English-dominated monolingualism, if added to existing language skills it may promote greater bilingualism, and it has the potential to support other languages for specific purposes. Thus, as individual speakers are empowered as language planners, and as worldwide rather than polity-based communication becomes more dominant, new challenges are posed for language planners in examining how they may help to shape a multilingual future.

Language Planning: Qin Shihuangdi's Contribution

WANG XIAOMEI

Qin Shihuangdi (259–210 BC) was the first emperor of unified China. Although he was a controversial figure in Chinese history, he did contribute significantly to the development of China from different perspectives. One of his contributions to Chinese culture was the unification of Chinese writing, which has drawn debate in the academic field (Chen, 1997, pp. 594–6). The *Shutongwen* 書同文 policy, the unification of writing, was the first intentional language-planning activity enforced by Chinese authority. It had a great impact on the further development of Chinese scripts and even Chinese culture (Li, 1985).

The implementation of the *Shutongwen* policy was triggered by both the political and linguistic situation during the Warring States period (475–221 BC). Before Qin Shihuangdi unified China in 221 BC, the whole country was segmented into seven states, namely Qi, Chu, Yan, Han, Zhao, Wei, and Qin. Each state ran its own administrative system and manifested different cultural characteristics. In terms of language, these states varied in dialects and writing regulations, which was obviously a negative factor for political unification. Among them, as Qiu Xigui (1988, p. 52) explained, the Chinese script in the Qin state was relatively conservative compared to the other six eastern states due to its remote geographical location. To facilitate intercourse between these states and later the transmission of military orders, Qin Shihuangdi promoted the unification of writing in conjunction with his political expansion (Chen, 1997).

Although scholars hold different views about the nature of the *Shutongwen* policy, due to the fact that no relevant documents have survived the Qin dynasty (Chen, 1997), to some extent they have reached consensus on the following. (1) *Xiaozhuan* 小篆, the Small Seal Script, was the official script for formal usage. (2) *Lishu* 隸書, the Clerical Script, was used more extensively in everyday life. (3) Scripts which were employed in the eastern states and were different from the Qin script were eliminated. During the process of codification, Li Si, the prime minister, was appointed to compile an index of Chinese characters and regulate the way of writing. According to *Shuowen jiezi* 說文解字 (Xu, 1996, p. 315), the first dictionary of Chinese characters in China, which was published in AD 121, Li Si suggested unifying all the Chinese characters when Qin Shihuangdi became the first emperor. However, recent studies (Chen, 2003; Galambos, 2006; Holm, 2010) indicate that the unification of scripts, which was a long process, started before Qin Shihuangdi unified China.

秦始皇帝初兼天下，丞相李斯乃奏同之，罷其不與秦文合者。斯作《倉頡篇》。中車府令趙高作《爰歷篇》。大史令胡毋敬作《博學篇》。皆取史籀大篆，或頗省改，所謂小篆者也。（《說文解字·序》）

When Qin Shihuangdi unified China, the prime minister, Li Si, suggested unifying Chinese characters and abandoning scripts which were different from the writing in the Qin state. Li Si compiled *Cangjiepian*, Zhao Gao compiled *Yuanlipian*, and Hu Wujing compiled *Boxuepian*. All the scripts were *Dazhuan*, the Great Seal Script from *Shizhou*. Some scripts were simplified and modified. As a result, *Xiaozhuan*, the Small Seal Script, came into being. (*Shuowen jiezi*, preface, in Xu, 1996)

In light of the theory of language planning, codification is a crucial procedure for corpus planning (Haugen, 1966), which focuses on the language itself, such as orthography, compilation of dictionaries, reform of writing systems, and so on (Kloss, 1969). In a society, the prestige code which carries greater importance and enjoys a higher status will be chosen. The Small Seal Script, Xiaozhuan 小篆, which is based on *Dazhuan* 大篆, the Great Seal Script, according to Xu Shen, was used as the official script in the Qin Dynasty. However, Qiu Xigui (1988, p. 65) holds a different opinion. Qiu contends that the characters used in the Qin state from the Spring and Autumn Period had evolved gradually into the Small Seal Script (Qiu, 1988, p. 65). No matter how scholars interpret the term "Xiaozhuan" and its origin, they all agree that the official script promoted by Qin Shihuangdi is Xiaozhuan. As part of corpus planning, Li Si, Zhao Gao, and Hu Wujing compiled three textbooks, which are known as *Sancang* 三倉, containing 55 chapters with 60 characters in each chapter (Bodde, 1967, p. 150). These textbooks are the fundamental teaching materials in which standard Chinese characters in Xiaozhuan are provided.

With strong promotion and strict regulation, Xiaozhuan was introduced all over the country. It was used in all formal domains as the standard form 正體字, such as inscriptions, school textbooks, and so on. In the meantime, Lishu 隸書, the Clerical Script, was extensively used by the populace due to its simplified structure and straight strokes, which gradually developed into the standard script in the succeeding Han Dynasty. As a matter of fact, the use of Lishu is one of the contributions of Qin Shihuangdi (Li, 1985).

To summarize, Qin Shihuangdi was the first person in China who planned the Chinese script consciously to meet the needs of unification and communication among the people. What he did can be analyzed in the framework proposed by Haugen (1966), who divided language planning into four stages, namely norm selection, codification, implementation, and elaboration. Norm selection falls into the category of status planning since it promotes a prestige norm; the other three stages are regarded as corpus planning since they are related to the language itself. By selecting Xiaozhuan as a unifying script for the whole country, Qin Shihuangdi found a way to unite people with diverse dialectal backgrounds. This tradition was passed on dynasty after dynasty. In this sense, Qin Shihuangdi established a tradition of using a unified script which is hyper-dialect and hyper-region. Although Chinese script has evolved several times in the history of China, its function as a bridging form across geographical regions has never changed. The policy of Shutongwen 書同文 by Qin Shihuangdi is indeed a great contribution to Chinese culture (Guo, 1972).

Language Play in Second Language Acquisition

MAGGIE A. BRONER

Historically, researchers have noted language play (LP) as one of the features present in learner language and have wrestled with two main issues: how to define it and recognize it, and what role, if any, it plays in SLA. Early mentions of the role of LP come from the literature in first language acquisition and conclude that LP is not only a feature of the language of young L1 learners but also seems to serve an important role in their socialization. Over the last two decades, research on language play has been receiving increasing attention in the SLA literature. Peck (1980) and Saville-Troike (1988) provide two often-cited early accounts of young children's use of language play, but it was not until the late 1990s and early 2000s that researchers began to study the role of language play in SLA in the language of older children and adults. A key question that current empirical research has aimed to answer is whether LP facilitates language learning. There are two major approaches in current research. The first, represented by Cook (1997, 2000), views language play as "fun," while the second has adopted a sociocultural view of language play as a type of private speech—best represented in the work of Lantolf (1997, 2000).

What Is Language Play?

Huizinga poses the challenge that the human species should be labeled as *Homo ludens* rather than *Homo sapiens* since in his view "play is the origin of civilization and culture" (cited in Cook, 2000, p. 110). Play is unpredictable and usually voluntary, it is rule bound, and has as a primary feature the acknowledgment that it is an activity that is "different" from "ordinary life" (Huizinga, 1966 cited in Tarone, 2000, p. 32). Within the most basic definition of play is the notion of "language play" (e.g., making puns, coining new words, imitating the language of others, constructing and repeating rhymes, and so forth). David Crystal reminds us that "everyone plays with language"; while not everyone engages in language play to the same extent, it is unavoidable (1998, p. 1). Hence, if language play is unavoidable as well as an integral part of the human experience, it seems logical to study it to gain insights from it into the process of learning languages. Yet it is only recently that language play has been taken seriously as a fundamental linguistic behavior that should be accounted for by linguistic theory.

Literature Focused on the Definition of Language Play

One of the challenges when reviewing the literature on language play is pinpointing its definition. In recent SLA literature, LP is mainly viewed from the perspective of two different traditions. The first assigns to LP purposes of amusement and labels it "ludic language play," later referred to simply as "language play" (Cook, 1997, 2000). The second tradition primarily describes language play as one of the functions of "private speech" (Lantolf, 1997, 2000). These two positions share the concern that language play poses a challenge to models of SLA that assume that language must be "natural" and transactional,

2 LANGUAGE PLAY IN SECOND LANGUAGE ACQUISITION

contending that a great deal of language serves purposes beyond the exchange of information. Yet it is important to note that these authors have different perspectives of language play as a phenomenon and in regard to its potential role in SLA.

Ludic Language Play

The line of research that defines language play as “ludic” is best represented by Cook. For Cook, play (including language play) is a natural phenomenon. Influenced by Bakhtin (1981), Cook views play as an activity that allows the creation of a world of fiction and imagination, a reality parallel to daily life but different from it and possessing its own meaning. It is a fundamentally human, creative, and intelligent phenomenon (1997, p. 227).

Extending this view to language learning, Cook asserts that there is a missing dimension in SLA theories based on the premise that language can only be learned when the learner is exposed to “natural” language, focused on meaning—rather than form—and transactional in nature. Furthermore, he proposes that not all language is uttered to produce or take part in meaningful, or even real, linguistic transactions. For Cook, there are two types of language play. The first type is formal, including play with the components of the language (i.e., sounds, grammatical structure, or both) such as puns, rhymes, alliterations, and so forth. This type of play is present in the following example where young children are creating “silly” rhymes with the sounds:

Child 1: Hey.

Child 2: Mother mear (laugh)
mother smear

Child 1: (laugh)

Child 2: I said mother smear
mother near mother tear
mother dear (laugh) . . . (Garvey, 1977, p. 37 cited in Tarone, 2000, p. 36).

The second type, semantic language play, is play with meaning that allows for the creation of fictional worlds:

Teacher: no hay recreo (*there is no recess*)

Leonard: no hay recreo (*there is no recess*)

Girl: no hay recreo ahora (*there's no recess now*)

Leonard: Ahora? Ahora no hay recreo, he, he, he (imitating a “villain’s” voice)
(*Now? Now there's no recess, he, he, he*). (Broner & Tarone, 2001, p. 372)

Both types of language play (play with forms and semantic language play) are found in the language of children and adults. There are various similarities and differences in language play depending on the age of the person engaged in it. Differences, for instance, may be found in topics and linguistic sophistication, while similarities—depending on age—include that both groups may use the same types of genres of language play (e.g., puns, rhymes, jokes, creation of world of fiction) as well as overt expressions of laughter. Cook contends that language play should be recognized as an important aspect of what it means to “know a language,” one that does not diminish but actually increases with age and that signals “advanced” proficiency (2000, p. 150).

Language Play as Private Speech: A Sociocultural Approach

A second line of research looks at language play as part of “private speech” (Lantolf, 1997, 2000). Early work using a sociocultural approach defines language play following Vygotsky,

who sees *play* as one of the principal factors in a child's development because it creates "a zone of proximal development" (ZPD) where the child acts well beyond his actual age. For Vygotsky (1978), children's play starts as a "form of activity," but as they grow up, imagination is transformed into "play without action" (p. 93). In other words, it becomes "abstract thought" (p. 103). As Lantolf states (2000), "as cognitive development proceeds, private speech becomes subvocal and ultimately evolves into *inner speech*" (2000, p. 13, italics in original).

Lantolf defines LP as self-directed speech, or language that is uttered and addressed to the self and not intended for public performance. He views this type of language play as "functions of private speech" (1997, p. 4). Using self-reported data from adult Spanish-as-a-foreign-language learners, Lantolf analyzed learners' usage of language play and characterized several types, including hearing words in the learner's head, talking to self in Spanish, practicing of language silently in one's head, repeating of sentences to oneself, thinking of ways to say something alone, and then asking for confirmation. An example of this type of language play is present in the next excerpt where adult learners repeat the Spanish participle "*devuelto*" in a silent voice to the self:

T: Felipe devolverá el regalo (*Felipe will return the gift*)

C: El regalo será *devuelto por Felipe (*The gift will be returned [participle] by Felipe*)

T: Only it's irregular. Devuelto. Devuelto (*participle of "return"*)

S: **Devuelto** [*silently to self*]. (Lantolf & Yáñez, 2003, p. 105; note: translation not in original)

An important characteristic of this type of language play is that it tends to disappear or diminish as learners acquire more language. Hence, this characterization assumes that language play possesses a role quite the opposite from that proposed by Cook. For Lantolf, it is an important social tool to mediate thought but not an end in itself.

Within the sociocultural framework, other notable early work includes that of Ohta (2001), who studied adult acquisition of Japanese as a foreign language. In her data from adult learners, Ohta found instances of language play as: "rehearsal, 'imitation,' and 'vicarious responses'—all part of 'a process by which learners in a classroom setting formulate their own answers to a question the teacher has addressed to another'" (p. 17). Her work also defines LP as one manifestation of private speech, specifically; language that is audible, self-directed; and not uttered to communicate with others. For Ohta, this expanded definition is important since it allows us to distinguish private speech from both inner speech and social speech.

In light of Cook and Lantolf's disparate conceptualizations of LP, Broner and Tarone (2001) assert the need to pinpoint a definition of language play. The authors looked at language play data from a fifth-grade Spanish immersion classroom and identified instances as one of these types: language play for *fun*, language play as *private speech*, and instances which functioned "as both fun and rehearsal" (Broner & Tarone, 2001, p. 364). The authors propose five cues that can help researchers identify the type of a particular language sample:

presence/absence of laughter; shifts in voice quality and pitch versus shifts in loudness/whispering; use of language forms that are well-known versus forms that are new; presence/absence of a fictional world of reference; and presence/absence of an audience other than the self. (Broner & Tarone, 2001, p. 376)

Broner and Tarone contend that this need to characterize language play in a way that is congruent with both prevalent theoretical traditions arises from the distinction that, for

socioculturalists, language play is a cognitive tool that aids acquisition and diminishes as learners become more proficient. They contrast this with Cook's view, in which language play of the fun/ludic kind requires "language forms that are well mastered and often willfully violate well known language norms," hence becoming a reflection of mastery of the language (Broner & Tarone, 2001, p. 366). Since then, different authors carrying out empirical research on language play have referred to Lantolf's and Cook's definitions of language play to analyze its role further in SLA.

Literature Focused on the Impact of LP on SLA

As instances of language play have been studied, it is pertinent to ask: does LP help language learning and, by extension, does it facilitate SLA? Most authors have been cautious in asserting that language play is a necessary condition in SLA. Nevertheless, Cook and Lantolf make strong cases for its inclusion as part of the variables that are present in SLA. Cook proposes that an ability to play in an L2 is a sign of mastery and acquisition and that we should view language play "both as a means and an end of language learning" and as a "test of proficiency" (2000, p. 204). Lantolf (1997) concludes that "language play, in and of itself, [may not] lead to successful SLA [however] without language play learning is unlikely to occur" (p. 19). More recently, Lantolf (2000), Lantolf and Yáñez (2003), and Lantolf and Thorne (2006) have made strong claims regarding language play as a type of private speech and about its role in *internalization*. Tarone (2000) also weighs in on the matter, noting that prevalent models of SLA have failed to incorporate this phenomenon, and calls for the need for SLA theories to account for the role of LP. However, she takes a more prudent stance on the role of LP in SLA, suggesting that it may be facilitative rather than necessary.

Since then, the conversation on language play has expanded. Pomerantz and Bell (2007) have proposed an *emergentist* view to address the role of play in language learning. The emergentist model assumes that linguistic competence grows out of experience and that play is part of such experience. The authors analyze the language that emerges from what they term "unsanctioned" LP that occurs outside organized, "fun" activities, and "sanctioned" LP that occurs during organized activities set up by the teacher to promote play. In studying an advanced Spanish conversation class, they found that language play was present throughout the range of tasks and that it accounted for language use that was richer in quality in comparison to that produced when students were following set rules. The authors seem to advance current findings in the research, as their data reveals how, through instances of language play during a nonsanctioned activity, students exploited the multifunctionality of words to amuse themselves. In the process, they showed evidence of the acquisition of "symbolic competence" (Kramsch, 2006) or the "ability to understand the meaning of forms in all its manifestations (e.g., linguistic, textual, visual, acoustic, poetic)" (Pomerantz & Bell, 2007, p. 570).

Imitation and Its Role Across Theories

Although not directly acknowledged in the literature, there is potential common ground between both approaches (the first, which treats language play as private speech, and the second, which categorizes LP as "fun"). Both assert that imitation plays a role in language learning. For the sociocultural approach led by Lantolf (2000), imitation is not "mimicking" but rather it is transformative and a way for learners to internalize the L2. In analyzing data from one adult learner of Spanish talking to herself (intrapersonal speech), Lantolf and Yáñez look at how the student appropriated language through imitation from "the linguistic affordances made available by the classroom community" (2003, p. 97):

The concept of “affordance” was developed by the psychologist James Gibson. Van Lier (2000, p. 252) defines it as “a particular property of the environment that is relevant—for good or for ill—to an active, perceiving organism in that environment.” (Lantolf & Thorne, 2006, p. 179)

They examine the role it plays in aiding internalization and suggest that when students imitate, it may be the play function of private speech that is facilitative of L2 learning. The authors conclude that while “production of private speech” does not necessarily guarantee learning, looking at samples of “language-focused private speech” can provide evidence of the linguistic affordances made available to learners and highlight what learners do to internalize them (Lantolf & Yáñez, 2003, p. 107).

For Cook and those those inspired by a Bakhtinian perspective, imitation is also a feature of language play. Particularly relevant in this line of research is the presence of “double-voicing” as a way for learners to appropriate and incorporate new voices thus expanding sociolinguistic and L2 repertoires. Throughout the literature there are numerous examples of children who use double voicing at various stages of acquisition. Cekaite and Aronsson (2004) present playful recyclings (repetition) in the conversations of nine recent refugee and immigrant children attending a Swedish immersion classroom. They show how recyclings helped children with little L2 to take part in playful (joking) interactions. The data revealed that one way in which children with limited L2 proficiency take part in humorous interactions is by repeating a peer’s non-native pronunciation and by using “role appropriations” (or double-voicing) such as imitating “teacher-talk” (2004, pp. 375–7). Cekaite and Aronsson conclude that the recyclings that appeared in humorous interactions among peers, “created a meaningful context for the acquisition of linguistic and pragmatic skills” (2004, p. 386). Thus both approaches aim to understand what learners do with the opportunities made available to them as they try to acquire an L2. Language play in its many manifestations is transformative, “fun”—even for socioculturalists (Lantolf & Thorne, 2006)—seems to aid internalization, and helps appropriation of sociolinguistically and pragmatically appropriate L2 voices. Across lines of research, what the literature has in common is the criticism that language play is often dismissed by theory and not treated as a serious phenomenon. Overwhelmingly, the evidence suggests that LP must be part of a comprehensive theory of language acquisition.

Language Policy and Multilingualism

HAROLD SCHIFFMAN

Language policy as a field of inquiry, rather than as a human activity, dates from the mid-point of the 20th century, when researchers of various sorts began to study the effects of language planning, which had gone on long before scholars turned their attention to it. One example of language planning (i.e., state-supported intervention in language) is the foundation of the language academies of the 17th century in Spain, France, Italy, and some other polities, where attempts to control the corpus (i.e., body) of the language were undertaken; in subsequent centuries attempts to control the status of language also began, for instance during the French Revolution (Brunot, 1905–53/1967).

As for the development of the field of inquiry known as “language policy” or “language planning,” we may perhaps date its origin to early- to mid-20th-century sociolinguists, sociologists, and anthropological linguists such as Edward Sapir (Mandelbaum, 1916), Charles Ferguson (Ferguson, 1959), Einar Haugen (Haugen, 1966), Heinz Kloss (Kloss, 1940, 1967), and Joshua Fishman (Fishman, 1966), who began to look at cultural attitudes toward language(s) as important topics of study, in other words beyond the traditional (behavioristic) focus on language structure. It was also a time of “ethnic revival,” when a number of situations involving language minorities and minority languages began to challenge previous assumptions about their place in the world—in Canada, it was the “revolt of the cradle” when Francophone Canadians began to demand that their language have equal status with English; in the United States, African Americans began to campaign for equal rights, and Cuban émigrés in Florida asked for the right to retain their mother tongue instead of accepting assimilation. Elsewhere, newly emergent nations in Africa and Asia faced decisions about whether to retain colonial languages or develop their own languages for education and other uses. At about the same time, researchers in other disciplines began to look at language as a source of political or legal conflict, so in the social sciences, the focus broadened, and the disciplinary tools used varied quite considerably from those of traditional linguistics. This disciplinary diversity continues to complicate, if not confound or vex, the study of language policy and planning.

As for the study of multilingualism, it is usually subsumed under the topic of language policy or language planning, but is also seen by nation-states, at least, as a vexed issue—having more than one language to deal with is seen as problematical: Nation-states that have a non-uniform population, where more than one language is spoken, are thought of as economically inefficient and multilingualism is therefore seen as an impediment to economic development (Fierman, 1991). The history of Europe, if not other areas of the world, is one where dominant language groups attempt to remove or marginalize other ethnolinguistic groups, or force them to abandon their mother tongues for the dominant language. Again, the French Revolution stands out as a blatant example of the efforts of the speakers of French to force speakers of other languages, such as Breton, Corsican, German, Catalan, Occitan, Provençal, and other languages spoken on the “margins” of France, to give up their *jargons*, *idiomes*, and *patois* in favor of Standard French, which was seen as the only fit vehicle in which to spread the message of the French Revolution (Schiffman, 1996, pp. 75–147). But one only needs to look across the English Channel to see attempts to suppress languages such as Welsh, Irish, and Scots going on; other European

nation-states and “empires” such as the Austro-Hungarian Empire and the Russian Empire were also contending with language issues and multilingualism. Nowhere in all of this was multilingualism ever seen as an asset, but always only as a liability and a problem. Thus in the United States the languages of immigrant groups are replaced by English within two generations, and immense amounts of money have to be spent in later years to get monolingual Americans to learn another language. The perception that multilingualism is bad for children stems from faulty research from the 1920s, where children from economically deprived but multilingual backgrounds in the US were found to do less well on intelligence tests (Haugen, 1956). As Haugen points out, this research seemed to have been carried out expressly to justify the “Americanization” agenda in US public schools at the time, bolstered by the isolationism of the post-World War I period.

All these preconditions could not but influence the development of an explicit agenda when “experts” whose focus was language-policy study were asked to make recommendations as to what kinds of language policies best suited the emergent needs of newly independent countries in Africa and Asia. This happened mainly after World War II, when the British Empire finally left South Asia, and in the next decades, when colonial powers found themselves no longer welcome in Southeast Asia, Africa, and other regions where colonialism still survived. The main question being asked was whether the former colonial language should be retained and, if not, which indigenous language might fill its place. In some polities (e.g., Indonesia), it was found that ousting Dutch and enshrining Bahasa Indonesia was an easy task, but in neighboring Malaysia removing English and replacing it with Malay has not been so simple (Mead, 1988). Sri Lanka downgraded English and tried to establish Sinhala in its place, with disastrous results for the minority Tamils, and for Sri Lanka’s economy (DeVotta, 2005). India’s attempt to make Hindi the “national language” and banish English was not so successful, but a three-language formula seemed to be a satisfactory compromise, though English seems to be making a comeback, especially in the era of outsourcing and call centers (Schiffman, 1996; Morgan & Ramanathan, 2009).

Many of the newly emergent polities, blinded by their zeal to indigenize their language policy and ban the hated colonial tongue, were themselves deluded by the notion that monolingualism was economically more sensible, so they tended to scrap their historic multilingualism and adopt Western “monistic” models of language policy. Only now are some (e.g., Sri Lanka) returning to their historic multilingualism as a language-policy model. Singapore is an exception to this: After having separated from Malaysia where the emphasis was to be on Malay as the national language, Singapore instead adopted bilingualism as a language policy, so Singaporeans are expected to learn their mother tongue (Chinese, Malay, or Tamil) as well as English. But even there, balanced bilingualism is a difficult goal to achieve, since English has symbolic capital that the other languages lack (Gopinathan, 1998).

Language Policy and Theory

As with many academic disciplines, language policy (and planning) lacks an overall theoretical unity. Various emphases can be found, especially given the lack of disciplinary unity (the fact that language policy is studied by people in different disciplines, with different emphases and priorities) and the fact that language-policy study is not centrally important in any one discipline, but exists as a sort of stepchild, forced to exist on the margins of any academic discipline where it receives any attention. Any study of language policy that does not privilege quantifiable data will be automatically suspect in many social-science disciplines, since “hard data” are all there is in those disciplines, and anything else is qualified only as “mentalism.” Since language policies often involve emotional issues

such as “love of language” and “linguistic chauvinism,” which are hard to quantify, many studies are dismissed as scientifically invalid, or as simply trivial.

Which Came First: Chicken or Egg?

One issue that crops up as soon as one begins to read the literature on language policy is whether language policy necessarily *precedes* language planning, or whether language policy is a *result* of language planning; concurrent with this conundrum is whether language policy can exist without any explicit language planning having been carried out at all. The definitions of language policy that one can find in the literature often refer to *explicit goal setting*, or *definite written plans*, but examples can be adduced to show that polities can have language policies without ever having planned or enacted them—the USA is a good example of this, since English dominates almost all official and unofficial domains, but no explicit policy officializing English has ever been enacted.

Some Commonality Exists

Nevertheless, some theoretical principles are generally accepted. One notion that most researchers find useful in the area of language-policy status is the distinction between *territorial* and *personal* rights to or for a language. Thus, in the Austro-Hungarian Empire, in the Soviet Union, in India, as well as in many parts of Western Europe, languages (or their speakers) are deemed to have rights within certain territories of the realm, while other languages have rights everywhere in the territory—the so-called “personal” right, that is the right to expect the state to respond to the person, wherever in the territory he or she may be. In some polities these kinds of rights are specified in the “official” policy; in others, the rights exist because of “tolerance”—a distinction discussed by Kloss (1940), who raises the issue of whether language policies need to be explicit (*de jure*, top-down, written, official, and overt) in order for us to say they exist, or whether policies that exist by tradition (i.e., are implicit, tacit, *de facto*, grassroots, unofficial, unwritten, and covert) can also be said to be as much a part of the “real” policy as the explicit (Schiffman, 1996).

As one researcher reports (Schiffman, 2006), it was the experience of studying a diglossic language, Tamil, and trying to determine what rules existed that would specify in which context or domain the L-variety (spoken language) would be used, and when the H-variety was more appropriate, that led him to conclude that language policy for Tamil involved a bipartite distinction. The H-variety is used for written purposes, and also for public speaking, but there are subtleties that cannot be predicted. Often public speeches begin in H-variety Tamil, then transition into spoken before ending in H-variety again. H is used on television for delivering the news, but other programs, including talk shows, sitcoms, and sports, are typically delivered in the spoken variety. Movies are almost exclusively the domain of the spoken language, except for the so-called “mythological” film. When speakers were asked for explicit “rules” for these usages, they could not easily specify them, and if asked who had formulated these rules and when, they were totally clueless, or declared that it had “always been thus.” The researcher had to conclude that the rules for the partition of H- and L-varieties had developed traditionally, and were aspects of an implicit or covert policy that governed these usages, which Tamil speakers learned by osmosis. One very pernicious aspect of this “policy” is that the H-variety is seen as the “real” language, and the spoken variety is only a corrupt, degraded version of it, spoken only by children and illiterates, and not worthy of any serious attention. This, despite the fact that tens of millions of Tamil speakers use it daily for 99% of their communication in Tamil.

These on-the-ground experiences and discoveries forced this researcher then to see that language policy must be viewed as consisting of both the official, explicit, written, codified,

and overt elements, and the unofficial, implicit, unwritten, grassroots, uncoded, and covert elements, and that language policy is therefore rooted in “linguistic culture,” defined as the whole complex of behaviors, assumptions, cultural forms, folk-belief systems, attitudes, myths, stereotypes, and prejudices about language, as well as the role of language as the main vehicle for the construction, replication, and transmission of culture itself. In his original postulation of “covert” aspects of policy, Schiffman (1996) proposed that covert policy could be seen as subversive, collusive, or inadvertent. Subversive covert policy was exemplified by the way schooling operated in Russian-occupied Poland before 1918, or in Catalonia in Spain under Franco. In these two polities, an underground system that systematically defied the official policies (Russian in Poland, Castilian in Catalonia) could be seen to operate, and operate very successfully, to keep Polish and Catalan alive under the domination of two repressive regimes. The other proposed aspect of covert policy is one where the entire society colludes to pretend that the language policy is one thing, when in fact something else is happening. An example of this would be language policy in the Indian state of Nagaland, where the “official” language is English, but where the actual language of instruction is Naga Pidgin, also known as Nagamese. This policy is carried out with the collusion of the entire society, mostly because Nagamese, being a “pidgin” language, is not deemed to be a fit vehicle for education, so English is put up as a kind of “window dressing” to hide the fact that the actual language that all Naga children understand is Nagamese; in other words, Nagamese is used as a “language of explanation,” though teaching materials may be overtly in English. (And, as it turns out, this use of an L-variety language as a “language of explanation” alongside other “official” languages is more common in the world than one would know from looking only at official statements about language policy.)

A third kind of covert policy, according to Schiffman (1996), would be one that came about inadvertently, in other words if the language-policy makers proposed a particular system, not realizing that it contained covert factors that undermined and subverted the overt and official policy, and in the end rendered the official policy ineffective. An example of this was, Schiffman suggests, German–American language maintenance programs in 19th-century German–American schools, which divided subject matter into practical areas, taught in English, and religious subjects, taught in German. Schiffman concludes that this division led students to see English as practical and useful, and to view German as ethereal and not very practical, leading to the eventual demise of German as the German–American community underwent language shift (Schiffman, 1987). Schiffman’s analysis was that German–American policy makers fully intended to maintain the German language in America for all posterity, and never imagined that their policy contained elements that would sabotage this goal. The reason they did this, of course, was to respond to pressure from American society at the time (the late 1880s) when various attempts were made in a number of Midwestern states to shut down German-medium schools. In order to mollify these opponents, the school policy makers hoped that using German for religious purposes could be justified on the grounds of religious freedom (Schiffman, 1996, p. 228).

As the proposed hourly schedule in Figure 1 suggests, religious subjects and German language take up 50% of the day, while secular subjects, taught mostly in the afternoon, are allotted the remaining 50%. German Americans succeeded in fighting off the attempts in Wisconsin (Bennett Act) and Illinois (Edwards Act) in 1889, which would have required that certain subjects be taught in English, and the proposed *Stundenplan* was an attempt to find a solution that would keep German alive while mollifying political opponents. When such a partitioned schedule was adopted, of course, it was a concession that led to *unbalanced bilingualism* and, eventually, to language shift.

Recently, other researchers have extended the notion of covert policy to apply to situations where policy makers cynically propose language policies that on the surface seem

to have one goal, but in fact contain surreptitious elements, hidden agendas, or other covert factors that are designed to thwart the overt goals (Shohamy, 2006), or are used to manipulate the populace who do not realize what is happening. Whatever the case may be, language-policy formulation, like other policy formulation, often involves unintended consequences that its planners never imagined would come about; it is therefore obviously more complex than popular conceptions of it may be.

Theoretical Approaches to Multilingualism

When one contemplates the issue of multilingualism, it is difficult to escape the impression that, no matter where in the world it exists, multilingualism is seen as a problem that needs to be solved. In other words, it is not viewed as a natural state of affairs, but as an exceptional kind of situation, and, when states and nations address the issue, it is more typical for them to avoid it, ignore it, or seek to eliminate it, than to accept it as normal. As we have seen with developments during the French Revolution, the revolutionaries saw the persistence of non standard dialects, *patois*, *idiomes*, and *jargons* (as they referred to other languages spoken on French territory) as a problem that needed to be eliminated, because only Standard French was a fit vehicle to spread the exalted ideals of the Revolution: *liberté*, *égalité*, and *fraternité*. Similarly, in the USA, English is seen by many, including judges in the citizenship courts, as the only fit vehicle in which one can understand American ideals. Therefore, would-be citizens cannot become naturalized without being able to demonstrate a knowledge of English. This requirement was not enacted by law, but came about by precedent in the immigration courts (Mertz, 1982).

The question of how multilingualism is dealt with in various language policies in the world is problematic. There have been attempts to typologize both multilingualism and the kinds of language policies that we find in the world, and to see how the two typologies might mesh, but these attempts have usually failed (Fasold, 1984). As one researcher put it,

One of the main problems that arises in the study of language policy, namely the lack of congruence between policy and the sociolinguistic conditions of the group in question, is rarely adequately dealt with in many analyses, despite the best efforts of talented researchers. . . . In fact there is a tendency, especially for lay analysts of language policy, to confuse language policies with societal multilingualism itself, and to map both onto the same symbolic representation. It is perhaps natural for decision-makers to assume that their policy fits the facts of multilingualism, and if it doesn't, to blame the facts rather than the policy. Thus popular accounts of language policy in France praise the monolingual policy, assuming almost that France is monolingual, when this is far from the case. Multilingualism is thus a pesky problem that would go away if people would only see the beauty of the policy. (Schiffman, 1996, pp. 26–7)

Six sociolinguistic factors are then enumerated that are often ignored in the description of multilingualism, and are therefore also ignored in the formulation of policy (Schiffman, 1996, p. 27):

1. religio-confessional aspects of the use of certain languages;
2. existence of strongly diglossic tendencies in the linguistic code of any or all varieties in question;
3. existence in a multilingual state of competing standard varieties of some minority codes in adjacent states;
4. effects of the functional load of register(s) on the policy;
5. implications of linguistic repertoire in the policy (especially focusing on degrees of proficiency in various skill areas, both active and passive, of various codes);
6. implications of linguistic register in the policy (in particular, implications of the existence of a dominant exocentric register for science and technology from an internationally dominant and prestigious language).

As an example of the first factor, the importance of Classical Koranic Arabic in many Muslim nations (and especially in Arabic-speaking ones) will mean that other languages spoken on the territory will be minimized or even ignored; only Arabic will be used for education, and at best other languages will be used as languages of explanation, since it takes years of schooling to become fluent in Classical Arabic. Similarly for the second factor: Arabic is strongly diglossic, such that there is almost no mutual intelligibility between Classical Arabic and its spoken dialects, but the latter are never used for education, except surreptitiously as languages of explanation.

For the third factor, in a multilingual state like Singapore, the standard varieties of Chinese, Malay, and Tamil are determined by China, Malaysia, and Tamilnadu in India, in other words they are all “exonormic” languages. Citizens of Singapore have no say in determining the norms, so they may feel that they have no stake in these languages and that they do not “belong” to them.

For the fourth factor, the functional load of a language like English in India is restricted to higher education and business, but the fact that the best jobs in India require a knowledge of English makes the goal of mastering it much more important than its restricted domains would suggest.

The fifth and sixth factors have to do with the feasibility of creating scientific and technical registers for languages that currently lack them, as a way to help preserve them and make all languages “equal.” Some researchers view this as a daunting and perhaps even hopeless task, given the immense resources available to languages of wider communication (LOWCs), especially English. Since other LOWCs seem to be on the same route to abandonment, as illustrated by the decision of the Institut Pasteur to publish its journals only

in English from 1989 onward, one is forced to conclude that, if French cannot compete with English as a language of science and technology, we can hardly expect Tamil, Uzbek, or Zulu to be able to do so.

Other Approaches

As an example of different foci and emphases within the broad field of language-policy study, we may benefit from a look at the contents of a recent book on the subject, edited and compiled by Thomas Ricento, *An Introduction to Language Policy: Theory and Method* (Ricento, 2006). This book is useful because it includes a much broader spectrum of possible approaches than other recent books on the subject have done. The topics dealt with are divided into three areas: "Theoretical Perspectives in Language Policy," "Methodological Perspectives in Language Policy," and "Topical Areas in Language Policy."

Under theoretical perspectives, we have articles that focus on "Frameworks and Models," "Critical Theory," "Postmodernism," "Economic Considerations," "Political Theory," and "Language Policy and Linguistic Culture." Under "Methodological Perspectives," we have "The Lessons of Historical Investigation," "Ethnographic Methods," "Linguistic Analyses," "Geolinguistic Analysis," and "Psycho-Sociological Analysis." Finally, under "Topical Areas," we have articles on "National Identity," "Minority Rights," "Linguistic Human Rights," "The Education of Linguistic Minorities," "Language Shift," "Sign Languages," and "Linguistic Imperialism."

This is indeed a wide range of topics, and it is safe to say that the choice of these topics and the exclusion of other potential ones would not be unanimous among many of these contributors—other potential editors of such a volume might choose a different range of possible topics, such as "language endangerment and how to prevent it" or any number of other possibilities. For example, a recent job announcement posted on a LISTSERV for a position lecturing on multilingualism listed the following interest areas: empirical studies of topics such as language description and documentation, language contact, loanword phonology, machine translation, language maintenance and shift, and multilingual language processing and acquisition. Given the fact that implementation is often seen as the "Achilles' heel" of language policy, the implementation of language policies ought to be scrutinized more thoroughly. It may be seen by some as fine and noble to issue grandiloquent pleas for one priority or another, but without methodical implementation, many goals being advocated are doomed to failure.

To summarize, language policies have always been recognized by serious language planners as being influenced by many social variables, and overlooking or ignoring any of them will lead in the long run to the failure of the policy. Similarly, ignoring any variables in the study of any language policy will result in failure to understand what makes a particular policy effective or not. It is currently fashionable in some disciplines to ignore economic factors, and to tar anyone who advocates the examination of economic factors with the label "economic determinist." But advocating the use of less-commonly taught languages (LCTLs) for science and technology naively ignores economic factors, and this alone may doom these efforts to failure. Language-policy study needs to be made less ideology-driven, and more focused on practical and empirical issues.

Language Policy and Planning: Overview

JOSEPH LO BIANCO

Human intervention to shape and direct both form and use of language must be as old as language itself, while by contrast the academic field analyzing conscious policy making or deliberate planning is very recent. Human societies have always been multilingual and language planning, whether overt and conscious or covert and implicit in other activity, has always existed.

Recent decades have seen an upsurge in the activity of writing and implementing policies on communication issues, especially on language and education, and there has been a related increase in academic description, teaching, and theorizing about language policy and planning. Today language policy and planning is the most applied of the applied language sciences and one with direct and substantial consequences for society, economies, education, and culture.

The entries in this section demonstrate these claims. Divided into field, methods and approaches, problems and critiques, key individuals, historic figures and celebrated cases, current issues and agencies, the overview shows some of the vast scope and importance of language planning and policy, without, however, exhausting the field. These entries supply a rich and refined treatment of a much misunderstood component of applied linguistics, very disparate in aims, methods, and consequences, but all tied to the planned, and sometimes unplanned, change and innovation in language and communication.

The entries under the term “field” account for the classic activities that are identified as constituting language policy and planning and specifically how status hierarchies are established for languages and language varieties; how the internal resources, the corpus, of a language or variety is modified and planned; how learning of languages and literacy occurs; how prestige is established for languages and language varieties and how discourse is shaped and influenced both intentionally and inadvertently.

The entries under methods and approaches canvass a wide, but not exhaustive, range of the activities of how language planning is conducted and how actual language policy and planning is studied and described by professional specialists.

The entries under problems and critiques survey some of the limits and critiques of the field of language planning that it has been subjected to in recent years.

The entries under key individuals and historic figures or celebrated cases are a selection from the very large number that could be included. These exemplify the biographies, interests, achievements, and difficulties faced by the individuals, some currently active, others historically important, who have shown that language change need not depend on public authorities alone. These language activists and strategists and the celebrated cases serve to show the immense variety of types and practices of language policy and planning, and that language change is deeply culturally and historically situated. Since language change, especially planned language change, is situated in specific temporal, spatial, and historic settings, analysis of language change reveals a great deal about processes of wider human cultural, social, ideological, scientific, political, and economic evolution.

2 LANGUAGE POLICY AND PLANNING: OVERVIEW

The entries under current issues serve to locate the vast activity of language planning and policy in the here and now, in the ongoing work of human individuals and organizations to fashion and shape language and communication practices to meet current or perceived future needs.

The entries under agencies serve to highlight some of the vast diversity that is encompassed under the term language policy and planning, underscoring the situated and locally determined nature of how people organize to change and innovate in relation to language.

The many roles of language policy and planning make simple descriptions or definitions problematical and because language planning is linked to the interests of various groups in society, it is therefore tied to politics and the play of interests and power in social groupings. It is sufficient to recall that not only literacy, with the consequences for cultural activity, recreation, science, and self-knowledge that literate behavior implies, but also language teaching, citizenship practice and civics education, labor market participation, and national identity are all impacted on by the activities of language planning. To account for such a diverse range of activities would require some mention of all the branches of the applied language sciences and many others. For these reasons language planning is the major activity where language specialists interact with economists, political scientists, teachers, sociologists, public policy officials, politicians, citizen interest groups, social psychologists, anthropologists, and other professional groupings.

While the entries contained here already deal with a forbiddingly complex set of activities they barely discuss some kinds of planned language change. The reference here is to those involving personal choices and social influence that might under certain conditions count as planned language change, such as how the talk of groups or individuals is styled for impression, for religious devotion, for political ideology, for identity construction, and display. Any number of psychological behaviors in which talk (self-talk as much as other-directed talk) shapes consciousness, awareness and feelings could under certain understandings and definitions count as language policy and planning. However, these have not been included here because of the difficulty in determining the degrees of consciousness involved that would render such practices instances of “planned” change in language.

Instead here we only discuss deliberate and conscious language policy making in social and interpersonal settings. The clearest examples are those related to public efforts to find solutions to language problems that utilize language expertise, such as when governments allocate resources in response to an overt language policy to support certain kinds of dialect, orthographic or standard language use, or various education measures.

Leaving aside subjective-personal realms of language planning and focusing here on the assumption that a great deal of future conceptual work is required to forge a comprehensive depiction of how intervention that shapes language, its form and use, operates at all levels and what role explicit knowledge of language has in elucidating these processes.

The majority of actual language planning and language policy making in the world does not make use of the insights and methods of professional language planners, nor of the body of concepts and experiences of past language planning. Instead language policy is treated as a subset of general policy making and seen to follow the rules and patterns for instituting change or improvement in any sphere of public action.

It is important to avoid mechanistic accounts of language planning. In the past these have had the effect of reducing the scope of the field too narrowly, admitting a government enquiry into reviving an old language, for example, but excluding how throughout history individuals, through writing canonical poems or politically persuasive speeches, have influenced language. These ways in which individuals through performative, influential, and persuasive verbal and written language action have shaped language itself, and people's identity, are always embedded in social evolutionary processes. Mechanistic

or reductive accounts of the practice of language planning would therefore discount some of the most powerful historical and current cases of how language change is “modeled” by powerful individuals.

The following section, drawing on past accounts of the scope and activities of language policy and planning (Lo Bianco, 2004, 2010a, 2010b), describes:

1. four main modes through which language policy and planning is manifested,
2. four spheres in which language policy and planning occurs, and
3. six broad activities of language policy and planning.

These are understood to involve discursive iteration within the affected speech communities and hence locally appropriate processes of resistance or embrace, toleration or rejection, compromise or subversion, are essential components of comprehensive and nuanced accounts of language policy and planning.

How Language Policy and Planning Is Manifested

Observing language policy and planning in its broadest sweep suggests that there are four broad modes of participation for members of a speech community or a population affected by language change. These are never totally discrete or complete, but instead constitute an ongoing conversation, usually unequally organized with privileged and less privileged voices. Naming these four forms in which language policy is manifested—public texts, public discourse, performativity, and deliberation—identifies key modes of participation available in language planning and policy. The aim here is to depict the dynamic iterative and dialogical character of the formulation of policy, its enactment, that is, how policy is experienced, and how to respond to it.

Public Texts

This is the most overt and declared mode, and involves laws, regulations, and formal operations of planning and implementation; the procedures for the preparation of public texts usually demand political legitimacy and control of institutional resources. A public text is usually the distillation of a process of debate, whether conducted in restricted and privileged circles or with wider participation.

Public Discourse

This refers to statements, discussion, and public attitudes that accompany, or respond to, or precede public texts; discourse is an essential component of language planning because formal declarations are not always implemented, and sometimes involve political rhetoric, interests, and ideologies that are contested or supported; in the discourse domain these are subjected to critique and analysis, and represent the space for public debate and understanding, appreciation and adoption, dissemination or contest and resistance against promulgated texts of policy, and the formulation of alternative courses of action.

Performativity

This refers to communicative behavior, both conservative role model behavior and subversive behavior, such as when certain language behaviors transgress, disrupt, or undermine accepted and established norms of communication. The communicative practices of powerful and significant individuals, institutions and entities, collectivities, and communities, supply scripts for emulating. Linguistic and cultural emulation suggest loyalties and identity

4 LANGUAGE POLICY AND PLANNING: OVERVIEW

practices of those who adopt them. Performative action is also a kind of covert language policy making when it transgresses what authoritative individuals model or proclaim or what public texts mandate.

Deliberation

Facilitated deliberation is a way of doing language policy and planning which combines the role of experts and their expertise, affected populations as representatives, and people with jurisdictional authority over a particular domain of language policy. Its general aim is to produce collectively agreed courses of action to solve language problems. It is a conscious and deliberate manifestation of language policy and planning.

Spheres of Activity for Language Policy and Planning

These four manifestations of language-change work occur within one or more spheres. For the most part language planning is undertaken within the sovereign powers of the state or its dependent agencies. However, even actions of resistance against state policy need to be understood within a wider framework of policy as activity and policy as conversation. The following four, modified from a recent discussion of Chinese language planning (Lo Bianco, 2007), represent both the actors/agents, and the domains or spheres of activity in which they act on language policy.

Sovereignty

A state or state authority acts within its exclusive sovereignty, or, increasingly in international action today, in pooled sovereignty across a series of jurisdictions. This is typically authoritative action involving the distribution of resources and the designation of roles and statuses, the modality will usually be various kinds of public texts, such as laws, rules, and sanctionable regulations. The main participants, the principal voices, tend to be elected officials, politicians, but also generals, that is, those with formal power that permits them privileged discourse in this realm.

Jurisdiction

This involves devolution from a sovereign power to an authoritative agency or public institution which has remit over a field or domain. An education department operates with devolved jurisdiction from a sovereign source, and legitimately pursues language planning within that field or domain. Public texts and the surrounding envelope of public discourse are the main modalities for this sphere of language planning. The voices of language professionals are more prominent in devolved jurisdictions because it is assumed these depend more strongly on professional stocks of knowledge and research. Citizen voices and affected populations are often heard via responses to commissioned reports or internal documents, and other public texts such as press releases and public announcements concerning resource allocations.

Influence

Influential individuals (whether by expertise, power, celebrity, or strategic position) or influential agencies convert public credibility or material power and diverse kinds of cultural capital into influence which they exercise over patterns of language use in multi-lingual settings, or preferred meanings, values, or styles of language use within single languages.

Behavior

A community of language users, singly or in association with supporters and experts, organizes its communicative expression in various ways to retain or recover language use intergenerationally, or to reject or accommodate the intended policy messages from sovereign action, or from institutional or administrative action. Often linguistic behaviors involve resistance or struggle against forces from outside that erode the capacity of the community to pass on its language through processes of intimacy or socialization directly to new generations or to newcomers, or to adopt new norms, expressions, or meanings that respond to its internal ideological or behavioral norms. In these ways what affected groups actually do, in spheres of their autonomy, can powerfully shape or contest what privileged others might seek to impose from outside.

The spheres of sovereignty and jurisdiction frequently involve explicit promulgation of formal policy, laws, or authoritative reports, and so forth; while the spheres of influence and behavior tend to involve policy making as practice, that is, social activity, or behaviors, rather than declarations, laws, or formal statements. The four manifestations of language planning, and the four spheres in which it occurs, typically apply to six actions or six purposes for activity involving planning and policy on aspects of language.

Actions of Language Policy and Planning

Actions That Formalize or Elevate the Status of Language or Varieties

The formal status of a language, dialect or other variety, refers to the legal standing and public functions envisaged by constitutional arrangements in a particular setting. Status is typically ascribed via public texts, such as constitutional provisions, and is undertaken within the realm of exclusive state sovereignty. However, subnational groupings, such as regions or provinces operating under autonomy statutes, can modify or elaborate or even contradict public texts and laws issued by authorities with overlapping sovereignty. Supranational groupings, whether governmental or nongovernmental, such as the European Union, the Association of Southeast Asian Nations, the African Union, the Red Cross, or the World Trade Organization, can also attribute and formalize status to languages that utilize pooled sovereignty to issue language-influencing decisions.

Actions That Modify the Corpus of a Language or Variety

Policy actions to impact on the status of languages are usually undertaken by politicians and policy makers working within the domains of the production of public texts, such as laws, constitutional provisions and authoritative reports, as described above. Actions that modify the corpus of a language are more typically a specialized activity entrusted to professional linguists, for technical innovation, and occasionally for adoption and dissemination, in collaboration with a community of speakers; though often also requiring normal policy processes for approval.

The activity of corpus planning involves modifications to the internal meaning-making resources of a language. This can include devising an orthographic system for a language which lacks a writing system, or modifying an existing orthography. Extensions to the terminological range of languages, including standardizing translation, codifying expression, and disseminating the use and adoption of new norms are part of corpus planning activity. This work of linguists to develop writing systems for indigenous languages or to develop terminology and expressions for both indigenous and national languages is ongoing. Dictionary writing and prestige literature also impact on the corpus of a language, and ideological and social movements can make language an object of their attentions.

Actions That Promote the Learning of Languages or the Acquisition of Literacy

This purpose of language policy and planning occurs within the remit of public education institutions and, consequently, is dependent on jurisdictional authority. Often, action occurs at the level of local curriculum implementation rather than in overarching policies issued to promote language acquisition or the expansion of literacy. A variety of agents undertake action to facilitate learning of additional or extended language skills or literacy, through a process involving interaction between experts, researchers, curriculum writers, assessment agencies, credentialing authorities, and learners and their families.

Literacy is a domain in which there is extensive involvement of nongovernment agencies in developing countries and in which aid and assistance programs of international organizations play a central role.

Actions That Extend the Domains and Use of a Language or Variety

This is a more recently identified purpose for language planning activity. It describes action taken to extend the settings and domains in which a language is spoken. Expanding the use of a language is seen to make that language stronger and longer lasting and is usually enacted on behalf of a previously suppressed language or dialect.

Actions That Elevate the Prestige and Esteem of a Language or Variety

This purpose of language-planning action refers to how writers and others with social prestige try to raise the reputation of a language. Historically, esteem has been conferred on languages in proportion to the quality and extent of their important works of literature.

Dialectal forms of standardized languages have benefited over time by a change in the esteem, regard, or informal status which they enjoyed due to the standing of authoritative poets, novelists, or scientists whose works were first produced in that form and which contributed to its standardization. Official academies support literature in the national language, and aim to bring about a change in the informal status of the language. Literature is far from being the only source or origin of prestige. Styles of speech that are attractive because they disrupt traditional notions of correctness or formal rules of appropriateness are also dependent on esteem within the subjective judgment of groups that desire and value such linguistic transgression.

Actions That Modify the Discourse and Attitudes Toward Languages or Varieties

Discourse planning refers to ways of modifying or reinforcing a worldview by persuasive talk or writing. Discourse planning has a range of meanings which include training people to develop persuasive ways to express themselves, so that they can participate in society and accomplish their goals by effective use of written or oral communication. Discourse planning, in its worst sense, means propaganda or brainwashing, but advertising, political spin, and some corporate promotion strategies fit into this category of language-planning actions.

These actions, the manifestations of language policy, and the spheres in which language policy planning occur, are an abstract account of the field and activity. The entries in this section elaborate these accounts into a depiction closer to the vast array of activity, historically and in contemporary life, in all parts of the globe and for all languages and communication systems that involve language policy and planning.

Language Policy and Planning: Kemal Atatürk's Contribution

İLKER AYTÜRK

Mustafa Kemal Atatürk (1881–1938) was an Ottoman military officer who led the Turkish war of independence against the entente powers in the aftermath of the Ottoman defeat in World War I. He and his followers, later known as the Kemalists, abolished the sultanate and the caliphate and founded the Republic of Turkey in 1923 on the remains of the Ottoman Empire (Mango, 1999). Atatürk was elected the first president of the new republic and spent much of the 1920s consolidating his power base in Turkey and institutionalizing an authoritarian regime, which was to carry out a broad package of Westernizing and secularizing reforms. As part of that radical reform program, the Turkish government imported the Swiss civil code and the Italian penal code to replace Islamic law, granted full equality to women, and adopted Western garb, clocks, numerals, and calendar. Having entrusted daily politics to a loyal prime minister in 1926, Atatürk focused on identity questions more and more with the ultimate aim of providing a secular identity for the Turks to replace their former Islamic identity. Therefore, it is no surprise that the rewriting of Turkish history and reform of the Turkish language became his pet projects, to the extent that he devoted most of his time to historical and language studies until he died in 1938.

Language and alphabet reform was an important subject on the agenda even before the establishment of the republic. Ottoman intellectuals and statesmen started to complain about the difficulty of writing Turkish with the Arabic alphabet as early as the 1860s (Gülmez, 2006, pp. 64–89) and drew attention to the negative impact of the wide gap between spoken Turkish and its written form, the language of the government and high culture (Heyd, 1954). By 1910 a movement for simplifying the flowery prose of Ottoman Turkish was already afoot, counting among its members some of the most important authors and poets of the day (Öksüz, 1995, pp. 77–165). Ziya Gökalp, arguably the most important ideologue of Turkish nationalism in the 20th century, was at the forefront of this movement and preached a moderate reform of the written language as well as the turkification of the language of prayer. Nevertheless, it was Atatürk who gave the reformers a sense of direction and much-needed government support and funding. Without his crucial backing, language reform in Turkey would have never picked up pace, nor would it have assumed such colossal proportions.

During the first years of the republic, the Turkish government did not have a clear-cut language policy and vacillated between an essentially Gökalpist strategy of moderate reform and radical purism. While everybody agreed on the necessity of some sort of language reform, the Turkish government and intelligentsia were divided with respect to the extent, depth, and limits of reform as well as the role of the state in language planning. Although the majority endorsed the moderate reform plan, radical purists and romanizers enjoyed support from Atatürk, who was the ultimate decision maker in the system. Certainly with his sponsorship, the Language Council (Dil Heyeti) was established by an act of the parliament in 1926 as the first republican institution to be in charge of language policy and planning in Turkey (Aytürk, 2008, pp. 276–9). The Language Council did not function

as an independent committee or a language academy, but was a branch of the Ministry of Education from an administrative point of view, receiving orders from the top. It achieved its first goal by writing a report on romanization in Turkey, which was successfully implemented in 1928 (Aytürk, 2010, pp. 106–8). The Council was not as successful, however, in its second task of preparing a Turkish dictionary, because of internecine conflict between moderates and radicals, and ceased its activities in 1931.

The following year, in 1932, Atatürk established the Turkish Language Institute (Türk Dil Kurumu or TDK) with lessons learned from the failure of the Language Council. Procedural separation between the state and the TDK was allowed so that the new institutional framework for language reform could resemble a scientific committee or, better, a language academy. While the TDK was designed as a private society, it could not possibly have escaped the orbit of the Turkish government, since its founder was the powerful president of the country. Indeed, Atatürk now threw his full support behind the radical purists, who dominated the TDK, in order to carry out what he called a “language revolution” and to create a new Turkish free especially of Arabic and Persian vocabulary. From 1932 to 1934, this policy was implemented religiously: the TDK launched a massive campaign to collect “authentically” Turkish words from ancient Turkic sources; when an ancient word could not be found to replace the unwanted Arabic or Persian term, new words were coined from ancient roots; all this new material was published by the TDK for use in the newspapers and other media; most of the newspapers agreed to use the new vocabulary despite a fall in their readership; and Atatürk and prominent Kemalist statesmen gave speeches peppered with neologisms in order to provide language reform with political clout (Lewis, 1999, pp. 40–56). Although opposition to the official language policy was possible, it did not go down well with the government and only a few individuals dared to object publicly.

The radical phase of language reform which started with enormous expectations in 1932 ran aground in only two years. By the early months of 1935 it was clear to all, including Atatürk himself, that the desire to create a completely purified Turkish and the unmethodical work of the TDK to achieve that goal produced nothing but chaos. Articles in newspapers, laws, and government directives in officialese were no longer intelligible to all, wreaking havoc in public life. It was at this point that Atatürk came up with the notorious Sun-Language Theory (Laut, 2000, pp. 48–161; Aytürk, 2009, pp. 23–31) as a face-saving formula, which helped him terminate the radical stage of language reform without compromising its revolutionary fervor and his prestige. Essentially, the theory was a bewildering combination of pseudo-philology, psychology, and themes from Freudian and Jungian psychoanalysis. Its practitioners claimed to have discovered layers of prehistoric Turkish influence in all languages of the world, a discovery that made Turkish the *Ursprache* of all humans. According to this logic, if all languages actually branched off from a Turkish mother tongue, then foreign vocabulary in Modern Turkish ceased to be an issue.

After the proclamation of the Sun-Language Theory at the Third Turkish Language Conference in 1936, Atatürk and the TDK returned to the Gökalpist path of reform. The radical phase of reform, however, was to taint the prestige of the TDK from then on and politicize language planning forever, dividing the nation as supporters (Kemalists and leftists) versus opponents (conservatives, Islamists, and liberals).

Language Planning in Religious Observance

ANTHONY J. LIDDICOAT

Introduction

The relationships between language and religion are complex and diverse and the area of religious observance is only one of the issues where language and religion intersect. It is, however, a significant intersection as language is the main vehicle through which communal religious observance is conducted. Although there has been much work done on religious language, the language of religious observance has not been widely considered in the literature on language planning although works in this area commonly mention religious language as an area of interest (e.g., Cooper, 1989; Kaplan & Baldauf, 1997).

One reason for the lack of attention to religious observance in the language-planning literature seems to be related to the agents of such forms of planning. Language-planning research has frequently privileged the work of governmental agencies over other possible agents (Liddicoat & Baldauf, 2008). Agents of language planning for religious observance are rarely governmental agencies. In fact, the agents of religious language planning may vary from large-scale international organizations, such as the Catholic Church, to more or less officially established groups of worshipers, to missionary groups, or to individuals. This means that the agents involved are rarely those of macrolevel language planning, but are more typical of meso- or microlevel planning (Baldauf, 2008).

The study of language planning for religious observance is also complicated by the nature of religious observance itself. Religious observance is both a public and a private matter and the language choices made may be either individual or collective. For example, reading a religious work, especially religious scripture, can be considered a religious observance, but the language decisions made here are personal and private. It is the public dimension of religious observance that is available for language planning, although the decisions made in the public arena may influence private practices. For this reason, the focus in this discussion will be on the use of languages for liturgical purposes—that is, the language used for the rites and rituals of public worship.

Approaches to Selecting a Language for Liturgical Use

Ferguson (1982) has identified the choice of language for religious purposes as a key issue in the relationship between language and religion. In part, this is because religious observance tends to demand highly marked and self-conscious uses of linguistic resources (Keane, 1997). For some religions, the selection of a liturgical language is not a matter for language planning, but rather is set by precedent: the continuation of an ancient usage. Such uses are a kind of indirect language policy or language policy by default—language choices made by collectively retaining the status quo. Notable instances of this are Hebrew in Judaism, Classical Arabic in Islam, Sanskrit in Hinduism and, until the 1970s, Latin in Catholicism. The use of these languages is dictated by the practice of the religion not by

the languages spoken by the faithful—in the cases listed here, the ancient liturgical language differs from the language varieties normally used by the community for nonreligious functions. These languages may be used primarily or solely for religious purposes and may be little understood by the many of the participants in the liturgy. In other religions, the choice of liturgical language is considered as something which can be legitimately planned by the faithful. For example, Protestant, Orthodox, and modern Catholic Christianity have adopted a language of the faithful as the liturgical language for some, or all, of the liturgy. These two possibilities are associated with two fundamentally different understandings of the nature and purpose of religious languages—sacrality and comprehensibility.

The first is the idea that a liturgical language is sacred (Liddicoat, 1993). Its purpose is the performance of a religious act in a way which is reverent and mystical. The liturgical act is undertaken between the performer of the act and its divine recipient and the faithful are secondary participants, whose role is incidental to the liturgy itself. For example, in Orthodox Christianity the part of the faithful is typically performed by a choir acting on their behalf, while in the traditional Catholic liturgy, the role of the faithful was performed either by a server, in spoken services, or by a choir and servers in sung services. Similarly, in Islam, the linguistic parts of the liturgy are performed by the Imam on behalf of the assembled faithful. In such contexts, the relationship of the faithful to the liturgy is primarily one of observer, although the observation itself may be understood as active and prayerful and may be supplemented by significant liturgical actions, such as changes of body posture or by other liturgical acts. In such contexts, understanding of the liturgy by the faithful is not seen as a necessary element of liturgical practice.

The second understanding views liturgical language as communicative; it has a role in communicating with the faithful and the force of the liturgy comes from its being understood. Such a view sees liturgical action either as a collective religious act, as a form of instruction, or as a way of propagating beliefs (Maltby, 1998). In this case, the language needs to be understood by the faithful and this is a criterion for its adoption for religious observance. In such cases, the liturgical language needs to permit participation and allow for access to the liturgical action for the assembled faithful. This was fundamental to the liturgical views of the Protestant reformers. As Article XXIV (Of speaking in the Congregation in such a tongue as the people understandeth) of the 1563 Anglican Articles of Religion state: "It is a thing plainly repugnant to the Word of God, and the custom of the Primitive Church, to have publick Prayer in the Church, or to minister the Sacraments in a tongue not understood of the people." The Protestant articulation of the selection of religious language couches the idea of comprehensibility within a theological construction of the divine will rather than that of a human objective within the religious context.

Both ways of conceptualizing the nature of a liturgical language orient to the different ways language allows the possibility of an experience of the divine (Ferguson, 1985). The sacral view is located within an experience of the divine as mysterious, numinous, and transcendent and engages with the divine through mediated, symbolic ritual. It orients primarily to the affective domain: engaging the worshipper with the divinity through an emotional communion. Such a communion does not need to be anchored in a literal understanding of the words used to communicate with the divine. The words become a vehicle for an affective response within the context of a liturgical action. Sacral approaches may in fact place a very limited emphasis on the language itself as a constituent part of the liturgy. For example, in the traditional Catholic and Orthodox liturgies some of the language used is not intended to be heard by the worshipper being articulated *sotto voce* or under the cover of chanting by the choir. The comprehensibility view is located within an experience of the divine as immanent and personal and engages more directly with the divine through collective communication. This view emphasizes the cognitive dimension of engagement with the divine: it is an intellectual communion oriented to understanding

the divine person or divine acts. In this form of communion, understanding the language is central to the proper execution of any liturgical act as liturgical acts have an important propositional dimension. Public language is therefore addressed not only to a divine person: the worshippers themselves are also understood as audience, and in some cases may be the primary audience. In reality, both views coexist in understandings of liturgical languages and the views of a community may shift between emphasizing sacrality and emphasizing comprehensibility.

Where sacrality is emphasized, the result is often linguistic conservatism. Within Orthodox Christianity, classical varieties have been maintained as liturgical languages, as in the case of the Greek and Armenian Churches, or a language has been maintained for liturgical use after the community has ceased to use it for other functions, as in the case of the use of Old Church Slavonic in Orthodox churches in Russia, Coptic in Egypt, or Ge'ez in Ethiopia. The origin of specifically liturgical languages such as Hebrew, Classical Arabic, or Latin is an expression of this linguistic conservatism—the maintenance of a language variety which has ceased to be actively used and understood for religious purposes. The conservative impulse can also be seen in religious groups which had initially adopted a comprehensibility view of liturgical language: the language of the vernacular liturgies of the Reformation were sometimes maintained unchanged for centuries creating registers of the language which were uniquely associated with religion (Spolsky, 2003). The 1662 *Book of Common Prayer* remained in regular use in many churches until the 20th century and the liturgical language of Anglicans became an archaic form of English, which in many cases was not easily comprehensible. The emphasis on sacrality may lead to linguistic conservatism in other ways, most notably in the deliberate selection of archaic varieties for liturgical use (Wales, 2001). In many cases, the development of vernacular liturgies begins with a conservative form of the language which is felt to be in some set a fitter variety for the expression of religious ideas. For example, the developers of the 1662 version *Book of Common Prayer* used a more archaic version of English than those developing the 1552 *Anglican Service Book*—that is, they took a deliberately archaizing stance (Nerväläinen, 1987).

Where comprehensibility is emphasized, one language-planning outcome is the adoption of the languages of the local community of the faithful for religious purposes. The issue of comprehensibility was fundamental to the Protestant Reformation and for Luther the development of a German language liturgy was as much a part of the process of reform as theology and church government (Tomlin, 2004). The work of Protestant missionaries has subsequently developed many languages as liturgical languages, especially in Africa (see e.g., Djité, 2008) and the Pacific (see e.g., Crowley, 2001). The Catholic Church, since the Second Vatican Council, has moved from a position of emphasizing the sole use of Latin for reasons of sacrality to emphasizing the use of vernaculars for reasons of comprehensibility (Liddicoat, 1993; Chupungco, 1997). This change has meant the development of new translations of liturgical texts, a process that is monitored and controlled by the Church through local conferences of bishops. Diasporic Orthodox Churches have also begun to widen the range of languages used in the liturgy, typically introducing the language of the host country into liturgical practice. Such changes are usually made in response to language shift within the community of the faithful (Wigglesworth, 2008).

Such changes are not without controversy. The inclusion of vernacular languages in the liturgical practice of the Catholic Church was the result of a long period of debate and discussion. The Council of Trent, in Canon 9 of Chapter 9, declared the Protestant insistence on vernacular languages in the liturgy to be anathema and the use of any language other than Latin was understood as detrimental to doctrinal unity (Liddicoat, 1993). Linguistic conservatism is therefore often associated with a desire to fix theological meanings as immutable forms. Religious traditions which emphasize a sacral language may reject

translation of religious texts as undesirable modifications of religious truth. This concern for preserving liturgical texts from error was one of the main arguments made by the post-Tridentine Catholic Church against liturgies in the vernacular (Liddicoat, 1993). The modern movement to vernacular has created groups of adherents to the Tridentine Latin Mass who see in the move to a comprehensible rather than sacral liturgical language a similar threat to church doctrine as that expressed by the Council of Trent (Kocik, 2003). Such resistance reveals a central tension in language planning for liturgical languages between sacrality and comprehensibility in the reception of language decisions. The emphasis on comprehensibility may alternatively lead to teaching the liturgical language widely to newly converted groups. This has been particularly the case in colonial contexts in which administrations favored the teaching and learning of the colonizer's language in mission schools (Pennycook & Makoni, 2005). There are, however, other instances in which a local liturgical language developed for a particular group is extended to new communities coming under the influence of the mission creating a language which is used as a liturgical lingua franca. For example, Dunn (2007) reports that in New Georgia (Solomon Islands) the Methodist mission first developed as Roviana as a liturgical language for a mission located in a Roviana speaking area. When the mission expanded to Tovu speaking Ughale Island, Roviana was used as the liturgical language of both communities and in the mission school.

In reality, the use of languages in liturgical contexts is not simply a case of using either a specifically liturgical language or of the use of the vernacular and many practices are in fact much more fluid. In part at least, this hybridity comes from the fact that the sacral and the comprehensible are not mutually independent and liturgical practices that emphasize the sacral often include instances of instruction. For example, in the Latin-rite Catholic Church the homily, which focuses on teaching, was delivered in the vernacular or a mixture of Latin and the vernacular (Constable, 1994). In the ninth century the Carolingian reform synod of 813 required that homilies be delivered "*in rusticam romanam linguam aut theotiscam quo facilius cuncti possint intelligere que dicuntur*" [In the rustic Roman(ce) language or in German so that those present can understand what is said] (Jungmann, 1951/1986, Vol. I, p. 458). In Islam, the Friday sermon is usually delivered in the language of the congregation even though the service is conducted in Classical Arabic (Mattock, 2001). Similarly, religious groups which emphasize the comprehensible may use other languages in their services, as in the case of Latin versions of sung liturgical texts in otherwise vernacular Anglican or Lutheran ceremonies. Such decisions are often made at the local level reflecting the needs and values of particular groups of worshippers.

Conclusion

The choice of a liturgical language is not simply the resolution of a linguistic problem, it is fundamentally connected to ideas of religious conduct and integrated into the symbolic systems of the religion. Decisions about liturgical language reflect understandings of the nature and purpose of liturgy as a collective action. Such understandings may be codified in some way within a religious group or they may be worked through locally by particular groups of worshippers. Regardless of the level at which such decisions are made, language planning for religious observance is a negotiation between views of language as a means of communication and as an expression of religious sentiment, between the immanence of worship as a local linguistic act and the transcendence of worship as a form of collective religious expression. Choices of liturgical language therefore encode aspects of the self-concept of the religious group, not just their assessment of their linguistic needs.

Language Problems as Constructs of Ideology

ULDIS OZOLINS

This entry details how the field of language policy and planning (henceforth LPP) began as largely a technical endeavor, often linked to development issues in third world countries, but increasingly became subject to and in part reflected significant ideological divisions over language and society. The ideological bases of some salient LPP cases are examined, as well as the often robust critiques of their intended planning goals. At the same time, the entry will give due regard to the *non*-ideological side of LPP, which needs some restoration from the ravages of the fiercest critiques.

In the early 1970s, one of the seminal works on language planning raised the question *Can Language Be Planned?* (Rubin & Jernudd, 1971). The field of language planning arose in relation to issues in third world countries in the 1960s, where decisions were being taken on issues of official and national language in many newly created states, and where very often the languages chosen, particularly if they were indigenous languages, needed to be able to communicate in new technical areas, requiring substantial augmentation. This also came in a context where the national language may not have been the first or even a known language at all to much of the population: Huge literacy and schooling issues resulted from the choice of national languages such as Indonesian, Burmese, or Swahili.

Many of these needs required technical solutions—such as creating written forms of a language, developing an orthography, creating technical vocabulary, most broadly identifying norms—and this has been a substantial part of the bread-and-butter work of language planning in developing countries. A central emphasis of this line of analysis was to see the language needs of new societies as essentially language *problems*, to be seen alongside other problems of development (Jernudd, 1982; Neustupny, 1983).

Yet, despite the seemingly optimistic and progress-oriented nature of this field (with book titles such as *Advances in Language Planning*—Fishman, 1974—and *Progress in Language Planning*—Cobarrubias & Fishman, 1983), there was always a recognition of the limits of technical planning and the salience of sociopolitical factors in any language prescriptions. Rubin and Jernudd's *Can Language Be Planned?* had already posed this as a question, and this political aspect was well captured in the widely accepted distinction between *corpus planning*—the technical operations on lexis and codes—and *status planning*—the clearly social and political promotion of a particular linguistic form or use. Thus, technical language planning relied on the initial setting of norms and goals by sociopolitical processes, and the concentration of many linguists was on the later technical processes, for, as observed by Lo Bianco, “status planning is rarely entrusted to language experts” (2004, p. 742).

And there was a very urgent point to this activity. Newly developing nations *had* to make decisions about language. While a state may in some cases leave matters such as religion up to individual conscience, it must choose a language—for administration and politics, for education, for public information—in these areas one language or a restricted number must be chosen.

However, the development of language planning over the next decades existed side by side with another strand of social and sociolinguistic research that stressed not rational

goals of language planning but the realities of language conflict. This awareness developed slowly post-World War II. The huge demographic losses, particularly among Jewish and other minority groups, the destruction or deportations of many German-speaking groups in Eastern Europe, and the advent of the Cold War and its frozen boundaries meant that most countries in Europe were much more linguistically and ethnically homogeneous than they had ever been or, as in Eastern Europe, that any comment on minorities or use of minority languages was strictly controlled. In the USA, melting-pot theory held sway. In the third world too, language conflicts came to general awareness only slowly, leaving much room for those concerned with language planning to conduct their research, linguistic modernization, and educational initiatives. Yet language planning became embroiled in growing conflicts; by 1991 Tollefson could produce a book entitled *Planning Language, Planning Inequality*, a critique that stressed the social differentiating role of language choice and (often) language imposition. From the case of India, where states in the federal system were created on the basis of languages, to the arguments over official languages in the Maghreb, to increased ethnic and linguistic tensions in sub-Saharan Africa, language conflicts came to prominence.

Moreover, the first and second worlds were also affected. The massive immigration first into the Americas and from the late 1960s into Europe brought a degree of linguistic diversity hitherto unseen, or long forgotten. And instances such as the desire of Quebec to promote French as its only official language, or the new salience of minority linguistic groups in Europe, revealed new sites of language conflict. Skipping rapidly to the breakup of the Soviet Union and Yugoslavia at the end of the 1980s and beginning of the 1990s, language issues in this region could scarcely be mentioned without the shadow of conflict.

Sociolinguistics was not slow to relate to these developments, leading to a massive growth in the area of contact linguistics as more and more situations of mixing of people with different languages could be studied. And while many such studies were only academic in nature, tying up language contact to second language acquisition theory or code-switching studies, many took seriously issues of language conflict and communication difficulties, characterized by the oft-quoted injunction that “there is no contact without conflict” (Rindler Schjerve, 2006, p. 111). Consequently, attempts to plan languages, to create a rational language policy for a nation or a region, could not be seen as a technical task, but as one profoundly ideological.

After the turn of the millennium, a number of studies abandoned the term “language planning” altogether, preferring *Language Management*, the title of Spolsky’s book (2009) where he asks forebodingly whether we should manage language, even if we can. And Nekvapil in his article “From Language Planning to Language Management” (2006) argues there has been a paradigm shift in this field and a total retreat from the notion of planning, due inter alia to its ideological baggage. As Lo Bianco summarized: “Language problems always arise in concrete historical contexts and these inevitably involve rival interests reflecting ‘loaded’ relations among ethnic, political, social, bureaucratic, and class groupings, and other kinds of ideological splits and controversies, including personal ones” (2004, p. 738).

Third World Language Policy and Planning

Dua, following Neustupny and Jernudd, focuses on how language problems are defined and what does or does not lead to their solution. In his succinct work *Language Planning in India* (1985), Dua provides a significant typology of aspects of LPP that may determine any particular language outcome, or “who learns whose language, when and how long, to resolve whose language problems” (p. 33). He offers a fivefold typology of language problems:

- language as symbol,
- language structure,
- language use,
- language user, and
- language materials.

In this Dua carefully interweaves ideological and technical aspects of language: “each of these criteria defines a wide range of problems which mutually reinforce each other in complex ways” (1985, p. 24).

Clearly, issues of language as symbol, and issues related to users of language, signal important ideological imperatives where languages are associated with identity, and often with social status or ethnic differentiation, factors that have been central to language conflicts and language settlements, not in India alone. Yet that is not the end of the story. Dua’s attention to language use, language structure, and language materials alerts us to the consideration that ideological aims cannot be unbridled, and cannot succeed without a basis in actual language use, capacity, and resources.

Issues of language use and language materials are closely related, determining the limits to enunciation of policy as symbol, and alerting us to material and communication issues in devising particular language policies. Ideological and practical strands are intertwined, rather than separate or sequential strands of decision making. Thus in India, each of the 14 official languages has had intense development of terminology and applicability, particularly in technological fields. And, for the non-Hindi languages, this has also served partly as a bulwark against the hegemony of Hindi—and English. By contrast, many vernacular languages in other countries have suffered precisely through poor materials (particularly literacy materials in education) and poor regard for actual use; consequently, these languages cannot escape from their lowly status in government, administration, or the marketplace.

We should also not regard the *failure* to bring about a certain outcome as always due to ideological reasons, as a triumph of one language regime over an attempted alternative. Dua’s typology alerts us to the ever-present variation among languages and their users in terms of size, salience, and resources; languages are highly unequally endowed, often exist in a hierarchical relation to one another, and many smaller languages will need particular resources devoted to them if they are to become more widely supported and diffused.

Turning to African language situations, an example of the interrelationship between ideology and other factors can be seen in the case of Swahili in Tanzania. This language was strongly adopted as a symbol of decolonization by the Nyerere government, but this built on its very strong basis of widespread use as a lingua franca used by many with perhaps other smaller mother tongues, and on its presence as a language constantly available in the Tanzanian environment (Mazrui, 1998; Wright, 2004, pp. 70ff).

Yet even a situation of widespread usage does not necessarily lead to official status: In the case of the widely spoken Wolof in Senegal, for example, French prevails in all official contexts. One aspect here is the often encountered widespread opposition to vernacularization (particularly vernacularization of education) among Africans, fearing that this will not give their children access to power and wider communication. Kamwangamalu (2010) gives an incisive analysis of this phenomenon, arguing that this assault on vernacularization will prevail unless the promotion of indigeneous languages first has strong political will behind it, and, second, can lead to material rewards and payoffs for its speakers. Taking an economics of language approach, he cites how other situations in Europe have rewarded speakers of vernacular languages through “promotions, raises, job tenure and other perquisites of success in the workplace [and . . .] generated a range of employment prospects for minority language speakers in education, the media and government” (2010,

p. 14), as has happened for example in the Basque Country or Wales (and we could certainly add Catalonia). The contrast between Welsh and the poorer placed Breton, Kamwangamalu argues, is largely in the material incentives to speakers of the language. Without such incentives, promotion of vernacular languages remains empty symbolic.

Kamwangamalu links issues of vernacularization to issues of globalization (largely seen as linked to English) and to internationalization, seeing the totality of African language needs in a situation where English-speaking parties are by no means the only ones interested in Africa economically, developmentally, or politically. He argues that the poor attention paid to developing materials in indigeneous languages plus the poor understanding of other international language needs besides English or another dominant colonial language, lead to the adoption of colonial languages by default: "Globalization, internationalization and vernacularization can coexist, in a productive way, in post-colonial communities in Africa, much as they seem to do elsewhere. The problem is that they hardly ever do" (2010, p. 15). As a result, vernacularization is under threat, even in what were once its strongholds.

In Tanzania, official enthusiasm for Swahili faded with successive changes of government and a push for greater use of English, leading, as Kamwangamalu argues, to a renewed desire to embrace English as the language of technology and information, and leaving Kiswahili, like many other languages, subject to "the Darwinian law of the linguistic jungle" where the stronger colonial language will prevail, without the resources and materials being put in place to support the vernacular language (2010, p. 14).

Yet the move to colonial languages, the overwhelming case in sub-Saharan Africa, has brought its own problems, with often disappointing educational results and languages such as English or French remaining very much the province of a small elite. Ohly gives a solid critique of this approach:

by following the modernisation theory, governments propagated the belief that there would be a homogenisation and harmonisation of society by introducing English as a "neutral" language. However, instead of a re-classing of society, the effect of introducing this extraglossic language was merely to re-stratify society. (Ohly, 2004, p. 111)

Some vernaculars, however, can be strong, if they have a literary, economic, or other socially recognized value, and Ohly cites the Nigerian example of Yoruba—which has a vibrant literature—as "a creative strategy that makes art amenable to popular dissemination media like television, radio and newspapers, which now accommodate poems and short stories . . . Yoruba is also taught as a subject from the beginning of primary education" (2004, p. 112). Ohly argues that a triglossic situation has to be recognized as being necessary in Africa—a colonial language of wider communication, a lingua franca (spoken by enough of the elite as well as the mass of people), and a local language. These languages must not be competing, but should form "a complementary environment in a functional multilingual situation" (2004, p. 112).

The significant factor here is the regional lingua franca: The prevalence of lingua francas in so many contexts around the world, not only Africa, almost always without being the object of any language planning, testifies in many cases to the triumph of use over ideology, especially where such lingua francas can achieve the complementary status mentioned by Ohly.

An example of complementary status of different languages is strikingly provided in the work of Stroud (2004). Basing himself on Fishman's theories of functional domains of different languages in contact, and Fishman's emphasis on intergenerational transmission of languages, Stroud points not to situations where languages have different domains, but to the way in which people will, in this "postmodern type of contact situation," use elements

of colonial and local languages in the same discourse to signal multiple alliances and belongings. Stroud uses recorded discourse from street-vendor women in Mozambique to show how the women will intermix elements of colonial languages and local vernaculars, resulting in “more a creative or *novel* generation of functions.” He argues that

languages in these contexts are no longer associated with a fixed set of cultural and/or political meanings; in concrete practices and everyday interactions, languages are used in ways that deconstruct traditionally given identities, and create multiple levels of, at times contradictory, but invariable [*sic*] always ambiguous meanings. (Stroud, 2004, p. 88)

This goes well beyond a standard approach to code mixing, often seen as some kind of debasing of language; rather, the intermixing of local and metropolitan language allows the women to link public and private spheres, gives them leads as to how to socialize their children, and maintains lively use of the local vernacular even when talking of wider national or global issues: “In today’s postmodern world, *new important functions* of language are being encoded in multilingual, and syncretic or code-mixed repertoires” (Stroud, 2004, p. 98).

Stroud’s other examples show how rural women in Mozambique will adapt the technology of literacy in the vernacular for their own purposes; a program to train in vernacular literacy to improve management of agricultural practices was seized on by rural women for quite another purpose: in order to write to their husbands or relatives, most of whom worked in South Africa, and to do so without the intervention of literacy brokers, gaining greater status and power also in their gendered new practice. Where there is a purpose to vernacular literacy, it will be taken up.

In the African situation, it is at times difficult to understand just how particular LPP can be analyzed ideologically, in the sense of policies adopted to suit particular interested parties, masked in persuasive rationalizations. Several collections of writing have uncovered a litany of LPP, which is confounding, as symbolic statements of policy are not matched by other implementation moves (e.g., Obeng & Hartford, 2002; Bromber & Smieja, 2004; Brenzinger, 2008). This is particularly noticeable in instances where almost all sub-Saharan countries adopted colonial languages as their official languages (Ethiopia, Somalia, and Tanzania being the exceptions), in many cases explicitly to avoid choosing an “ethnic” or “tribal” language. And many of these governments have been willing to live with the poor education outcomes that result from large proportions of their children having only rudimentary access to the colonial language. One recent study (Albaugh, 2009) reports an interest in supporting African languages in Francophone Africa, as a result of close interaction between African and French scholars and educators; however, in Anglophone Africa the situation has been more ambiguous—several governments have adopted policies to introduce more education in the vernacular languages, but almost never with attention to appropriate consultation, material development, teacher training, attitudes of the parents and teachers, or any long-term planning for these vernacular languages (Mtenje, 2004; Simpson, 2008). As Blench observes in his analysis of the West African language situation: “No government these days can be seen to be against minority language, but few governments have the political will to actively support [such] languages” (2008, p. 152).

This leads to the conclusion that, while expressions of support for vernacular languages can be seen to have some symbolic worth, and seem designed to bolster government credentials of looking after all their people, the palpable *lack* of planning in many cases points precisely to a lack of ideological commitment to these languages, often with education ministries not implementing or even opposing vernacular policies. Meanwhile, the actual interests of elites and their ideological purpose is represented in the continued

domination by colonial languages in education, social selection, the publishing industry, and often aid from former colonial powers, resulting in what Myers-Scotton termed “elite closure” (Myers-Scotton, 1993). On the margins, ordinary people in Africa, in the face of globalization and weak states, create their own mix of codes and situated use of both metropolitan and vernacular languages, to establish their own trajectories of language use quite removed from LPP efforts.

Ideological Clashes and Accommodating Practices: The Baltic States

Our final example of LPP concerns a language situation where an ideological stance on language is explicit, from both proponents and opponents of a particular language policy, but where again we will find paradoxes and language-use patterns not always aligned to surrounding political rhetoric.

The Baltic States, since regaining their independence from the Soviet Union in 1991, have adopted language policies that have brought considerable friction and quite diverse interpretation and responses. The Soviet period saw a massive influx of Slavs and others from Soviet republics, so that the titular nation in Estonia was reduced from nearly 90% of the population prewar to 61.5% of the population in Estonia in the 1989 census, while in Latvia the titular nation was reduced from 75% to 52% in the same period. Lithuania maintained its former national profile of around 80% titulars. Soviet-period settlers also rarely learned the local languages (only 15% in Estonia did so, around 22% in Latvia, but 35% in Lithuania; Hogan-Brun, Ozolins, Ramoniene, & Rannut, 2007, p. 505). Russian was the language of most Soviet-period settlers (and many non-Russian settlers were russified during this period). Separate Russian-language schools, publications, and broadcasting systems were instituted, and Russian was used ever more widely in administration and employment, leading to the situation of asymmetrical bilingualism, where local nationals needed to be bilingual in their language and Russian, while Russian speakers received all services in Russian and were self-sufficient in this language (Knowles, 1989; Grenoble, 2003). Skutnabb-Kangas has succinctly defined the Baltic language situation as one where minority/majority relations have been inverted:

Russian is thus a majorized minority language (a minority language in terms of numbers, but with the power of a majority language), whereas the Baltic languages are minorized majority languages (majority languages, in need of protection usually necessary for the threatened minority languages). (quoted in Hogan-Brun et al., 2007, p. 594)

As a result, on regaining their independence the countries reinstated their national languages as the only official state language, and began a massive drive to have the non-titular inhabitants learn the national languages: All people whose employment brought them into contact with the public, and who did not have a titular school education, needed to sit attestation tests in the national languages, according to their level of employment. Based on their view of an illegal Soviet occupation, the Baltic States did not see themselves as two-language communities, and were determined to break the Soviet pattern of asymmetrical bilingualism and dominance of Russian. When Estonia and Latvia also determined that Soviet-period settlers were not automatic citizens of the renewed independent countries, but needed to pass a language and history test to gain citizenship, another locus of conflict developed. These language and citizenship policies were fiercely opposed by the Soviet Union and later Russia (Alksnis, 1991; Ramishvili, 1998).

The friction also went beyond the Baltic-Russian arena when European organizations expressed views on this situation as part of the Baltic States' accession to the Council of

Europe, the European Union, NATO, and other European bodies (Ozolins, 2003), bringing often protracted negotiations over language rights. While European bodies finally accepted the Baltic credentials with these language policies largely endorsed, with the exception of some compromises, the friction with Russia still exists and Moscow still calls for automatic citizenship and the recognition of Russian as a second official language.

Thus far, the ideological basis of language policy and opposition can hardly be doubted, but its playing out shows some surprising accommodations and practices. First, while Russia has always seen this conflict as one of discrimination of local groups, and an active player in many negotiations has been the High Commission for National Minorities of the Organisation for Security and Cooperation in Europe, the Baltic States have defined it largely as a foreign-affairs issue, claiming negligible local mobilization against the language policies and support for their policies even among the non-titular population.

The Baltic stance on language was accompanied by specific LPP initiatives—in education, there has been the steady introduction of the national languages first taught as subjects in Russian schools, then at secondary level teaching a proportion of the curriculum in the national language, and making all higher-education teaching in the national language alone. But equally, outside of education, there was the exclusive use of the national languages in official correspondence from public bodies, in public information areas such as announcements in transport, as well as the decyrillization of streetscapes and public notices—the national languages became the languages of the environment and public space.

From the Baltic side, a basis for policy has always been a perceived threat of the dominance of Russian with its huge market, media, and neighboring population; clearly, the languages are very unequally endowed and this sense of threat has been apparent in Baltic statements on their position (Budryte, 2005; Verschik, 2005; Latvia, State Language Commission, 2008; Rannut, 2009).

Yet a number of language practices has also been picked up in recent surveys that belie language conflict or ideological clash. Taking the example of Latvia, the Baltic Institute of Social Science has run language surveys since 1996, giving a valuable time series of language use and attitudes in Latvia; their 2008 survey identified that a

series of positive changes which indicate that the status of the Latvian language is firming up among minority populations should be noted: the skills of state language have improved, the public environment in which Latvian is spoken has expanded, and attitudes towards the speaking of Latvian have improved. (Baltic Institute of Social Sciences, 2008, p. 8)

The report found overwhelming approval from both Latvians and Russians of the view that “it is important for each and every resident of Latvia to speak the Latvian language” (2008, p. 15), and found that the proportion of Russians who spoke only Russian at work has declined from 60% to 28% over the past decade. Correspondingly, while schools no longer require compulsory Russian learning, Latvians overwhelmingly support the importance of knowing Russian, and in their daily practice will often respond in Russian to Russian interlocutors—even where such interlocutors also speak Latvian. The report speculates that

On the one hand, these data indicate competition among languages, because people feel that it is important to speak both languages. On the other hand, data suggest that there are [*sic*] now greater tolerance towards languages, as in both ethno-linguistic groups people are more likely to recognise the importance of the other language. (2008, p. 15)

Nor is the Russian language under threat, as the still extant Russian school system and extensive Russian media testify. The significant outcome has been the unusual situation

of a very large number of speakers of a larger language now also adding a smaller language to their repertoire—the survey claimed that some 93% of Russians now had some knowledge of Latvian, an enormous change in two decades (2008, p. 22). And this has not been a case of language shift, as Russian is well maintained, but of the addition of an L2.

The competition between the very unequally endowed languages in the Baltic space will remain a constant, yet the actual language practices indicate a nonconflictual accommodation of goals and a general agreement of the LPP moves made, whether in education, employment, or public life, eschewing hardline ideological views on either side.

Ideology, State Enterprises, and Social Movements

A final comment on ideology and LPP takes us back to the work already cited of Dua and others who have worked to establish typologies of language action that can show both ideological and non-ideological aspects of LPP.

Nahir's (1984) comprehensive analysis of LPP goals identifies 11 approaches to language problems: purification, revival, reform, standardization, language spread, lexical modernization, terminology unification, stylistic simplification, interlingual communication, language maintenance, and auditory-code standardization. Nahir's approach very economically summarizes the history and ambit of LPP, yet also reveals its inherent bias and limitation. As almost all authors, Nahir sees the work of LPP as largely the work of *agencies*, official agencies in each case, either governmental or at arm's length of government—ministries of education, cultural institutes, academies, official media, and so on. Yet some LPP moves do not come from official agencies, but are actually social movements, which argue for change in aspects of language as being essential to meeting important social goals. The most obvious (and at least partially successful) has been the feminist movement seeking to eradicate sexism in language (Carney, 2003); other movements have also tackled racism in language, or advocated specific changes, such as reference to disability. This clearly links up with the emphasis on actual social practices and language use that have been emphasized in this entry; however, an important aspect of the social movements is that, recognizing the importance of government action, public information, and media, strenuous efforts are always made to influence precisely these agencies, so that new norms will be established for official communication and the wider society.

Any language action—correction, defining of problems, institutional LPP, social movements around language—will always have its ideological aspect, promoting the interests of that sponsoring group, and potentially ideological opposition as well, which is little surprise in dealing with an area of human life of such encompassing importance in defining meaning and interaction; yet ideological stances and intentions will yield little, and may remain emptily symbolic, if language-planning technologies cannot be effectively put in place and help to make new language practices viable, acceptable, and rewarding for those using that language or form.

Language Rights in Language Policy and Planning

MARY MCGROARTY AND SHANNON FITZSIMMONS-DOOLAN

In this entry we outline some of the principal questions regarding relationships between ideas about linguistic human rights (LHR), also called language rights, and selected theoretical and practical issues in language policy and planning (LPP). Both LHR and LPP are highly interdisciplinary fields that involve applied linguists along with many other public and professional participants and audiences.

The existence, nature, extent, and practical implications of language rights constitute some of the areas of liveliest concern within LPP. LPP itself has been defined in various ways, from classic modernist, structuralist models that separate the domains of knowledge, power, and action to more contemporary approaches that encompass considerations of the variety of social practices and attitudes surrounding acquisition, learning, and use of languages and language varieties (Lo Bianco, 2010). Drawing further inspiration from constructivist and postmodern theory, recent models emphasize the continued mutual and reciprocal influence of actors and domains on each other. Hornberger's (2006) discussion integrates the major concerns of established LPP models, showing how various typologies have framed the three typical goals of language planning: efforts to influence (a) the allocation or functions of language (status planning), (b) the learning of language (acquisition planning), and (c) the forms of language (corpus planning). (All three areas are more easily distinguished in theory than in many applied contexts.) LHR concerns can inform all three types of goals, although issues of status and acquisition planning have generated most (but not all) of the LPP controversies arising in recent decades. Like other rights, language rights can be usefully formulated from both "negative" and "positive" perspectives, with the negative, or tolerance-oriented, perspective embodying freedom from harms and the positive, or claims-oriented, perspective creating duties or rights to goods or services supplied by others, usually public authorities. Tolerance- and promotion-oriented conceptions of LHR differ in their implications for social action and thus in their connections with explicit LPP.

Understanding the origins of human rights theory generally assists in appreciating the various contemporary manifestations of LHR. Human rights theory arose from the multiple socioeconomic and political transformations of modernity (Donnelly, 2007), including growth of an educated, materially successful bourgeoisie and the gradual establishment and legitimization of governmental (rather than private or religious) actors and agencies charged with vital social responsibilities, such as keeping the peace and gathering and allocating the material resources needed to maintain communities. From the 17th century onward, intellectual attention to the existence of human rights was predicated on growing literacy rates that gave ever larger audiences direct exposure to vigorous political discussion along with popular novels highlighting individual experiences (Hunt, 2007). Thus, the concurrent growth of modern nation-states and the greater empathic capacities of their citizens stimulated the elaboration of doctrines of social and individual rights and responsibilities, providing the ethical foundation for acceptance of human rights.

Immediately after World War II, international alliances associated with the victors led to the formation of the United Nations, which produced an eloquent endorsement of

commitment to the optimal conditions of human and social life in the 1948 Universal Declaration of Human Rights. This document took further explicit steps toward specifying the rights one had simply by virtue of being human, attesting to the strong postwar drive for universality in defining rights (Mertus, 2005; Donnelly, 2007). In the middle decades of the 20th century, this document's sweeping provisions were most readily applied to support for the most basic physical protections for life, safety from bodily harm, and rights to own individual property.

Beginning in the 1960s and continuing through the 1990s, however, subsequent intellectual, social, and political developments arose indicating that the physical safety of persons and property, while never unimportant, was not the sole dimension of human dignity giving rise to rights. International conventions began to reflect a wider conception of the nature of human identity and dignity coincident with the rise of (a) attention to the legitimacy of claims by nations demanding independence from colonial powers; (b) groups such as women seeking social, political, and economic equality; and (c) growing consensus regarding the need for special protections for groups such as children (Alston & Crawford, 2000). Concurrently, the theoretical dominance of a homogeneous model of the state was gradually replaced, in many polities, by a multicultural model in which the state belonged not to a single historically established national group but equally to all present citizens, who then could make claims for various levels of protection and support on the state (Kymlicka, 2007). Such claims could include the protection of distinctive social and cultural attributes such as ethnic membership, which, in some geopolitical settings, was extended to language too. The social and cultural practices of individuals and groups thus became arenas where identification and protection of related rights emerged as legitimate issues. As such their identification, protection, and promotion then emerged as plausible and, for many constituencies, desirable activities (May, 2003, 2005). A high enough degree of political consensus around identification, protection, and promotion of such attributes would then warrant consideration of whether and how public resources should be devoted to related activities.

In general, three types of institutional actors have been involved in the codification and administration of language rights. International bodies such as the United Nations and the European Union have drafted and endorsed foundational documents articulating language rights, and have then generated sufficient social consensus from participating nations to permit treaties and conventions recognizing such rights (Alston & Crawford, 2000). Nation-states, however, have most often been the entities charged with the enforcement of internationally enumerated rights, including language rights, in part because sovereignty issues take primacy over rights issues (Donnelly, 2007). In addition to the ratification of international documents, individual nations may articulate language rights in their constitutions and other bodies of law (see Faingold, 2004). Finally, and increasingly prominent in the realms of theory and application, non-state actors, such as nongovernmental organizations (NGOs) and more localized groups working for ethnic rights of specific communities, have come to play ever more active roles in the promotion, implementation, and monitoring of language rights (Mertus, 2005). Typically, all these institutional actors draw on the expertise of attorneys, academics in various fields (including but not limited to applied linguists), and community activists, individuals whose training and experience confer the credibility needed to advocate, analyze, and defend policies related to language rights (Spolsky, 2006).

Language rights, like all rights, are social agreements that can guarantee varying levels of state tolerance (negative rights) or active support (positive rights) (Dunbar, 2001; Faingold, 2004) and may require the allocation of some form of public resources (Bruthiaux, 2009). Several scholars characterize rights generally and language rights more specifically as strong requests in a rhetorical sense (Donnelly, 2007; Bruthiaux, 2009). The ultimate success

of these requests rests in part on the persuasiveness of the rhetorical argument in which they are delivered, their fit within existing regional and national modes of governance, and their impact on the allocation/reallocation of the public resources needed to comply with the practices mandated by the request.

Argumentation for specific language rights can be advanced and received in several ways. For example, many human rights-based arguments for language rights are situated primarily on universal moral grounds (Skutnabb-Kangas, 2000), while other arguments rest on empirical support (Francis, 2005). In addition, recent rhetorical trends from the state perspective include the prioritizing of economic development opportunities for individual members of language minority communities over the protection of the cultural rights of such communities (da Silva & Heller, 2009). Along a hypothetical continuum of rights—with negative or tolerance rights at one end and positive or promotion rights on the other—those closer to the positive or promotion rights end generally require more public resource allocation (Bruthiaux, 2009). That is, in general, it would require fewer public resources to allow or require use of a minority language in media outlets (which may be privately supported in whole or in part) and more public resources to provide public education solely or partly through the medium of a minority language (see Tollefson & Tsui, 2004). Given the scarcity of resources in any national system, Grin (2005) argues that, to meet the tests of policy makers' evaluations, successful language rights requests must address resource allocation in specific and realistic terms. He suggests that the net results of cost-benefit analyses, though problematic to calculate, would generally support the promotion of language minority rights and linguistic diversity. The next step in a resource allocation argument would then be examination of the net benefits across societal groups.

In a catch-22 situation for language rights advocates, the increasing trend toward privatizing management of public goods, including linguistic resources, complicates the application of cost-benefit analysis to implementation of language rights policies (and all policies pertinent to public goods). Such trends deceptively shift the costs of language resource management to private hands while retaining the benefits in the public interest (see Fulcher, 2009, on university-level second language instruction in Britain). Thus, as outcome measures for both language rights arguments and economic development rights arguments converge in the form of positive cost-benefit results, the need for explicit language rights articulation could become deprioritized, a victim of the "erasure" or denial of connection between social causes and effects.

Overwhelmingly, explicit language rights are advocated to protect or promote the use of minority as opposed to majority languages (May, 2005; Patten, 2009). Specific arguments for protection of minority language rights (MLR) originate in an understanding of socio-linguistic processes such as language shift and language loss as well as language-related sociopolitical processes affecting social identity and mobility (Kymlicka, 2007). Among the major theoretical and practical gray areas in the application of MLR are questions about to whom such rights apply—individual members of minority language communities or the communities themselves. For example, the right of a parent to use a minority language with his or her child is applied to an individual. In contrast, a right such as the right of minority language users not to have to shift to a dominant language is applied at the group level. A related critique is that systems involving both individual and group rights are so riddled with contradictions that they may be irreconcilable.

Nuanced examinations of rights applications address some of these concerns. Group (or collective) rights applied intra-group may, in fact, sometimes restrict individual rights and thus be less tenable in systems of modern conceptions of liberal democracy. On the other hand, group rights applied only across social groups (rather than at the individual level) may avoid conflict with individual rights (Kymlicka, 2007; Patten, 2009). Furthermore, in

some cases, the existence of, or potential for, conflict rooted at least partially in questions of linguistic diversity may prioritize the need to accommodate group or collective language rights (Kymlicka & Patten, 2003). In such discussions, special attention must be given to the nature of the links between an individual and the language/s attributed to him or her. Claims that essentialize individual identities and ossify the dynamic relationships between individuals and situations of language use are particularly susceptible to criticism (May, 2003). Conflicts between individual and group language rights are possible, and may require adjudication by relevant authorities.

In international and national policies, language-related protections and claims are not consistently accorded independent conceptual space; often, they are embedded in core beliefs related to various other socially salient categories such as ethnicity, goals of education, and the competencies expected of citizens (McGroarty, 2010). In other words, language concerns, including language rights, fit into existing national value profiles differentially, and these social value profiles, too, are dynamic and subject to change over time (McGroarty, 2008). Universalist claims about language rights are attractive in their scope but insufficient for social impact without the leadership and coalition building that underpin policy implementation and success in local and national governance.

In sum, levels of political consensus and attendant LPP actions related to language rights are highly institutionally and contextually specific. Relevant social units differ in size and autonomy, all the way from international organizations and nation-states to smaller geopolitical entities such as provinces, counties, and cities, to administrative units such as school boards or school districts, to the different types of affinity-based units, such as religious and cultural groups, that constitute civil society. Crucially, language rights claims are proposed, interpreted, and supported in different ways for different types of groups, with indigenous groups (such as Native Americans in the USA or Aboriginal groups in Australia), territorially based substate groups (such as the Québécois French in Canada or Catalans in Spain), and recent immigrant groups (notably the post-1960s immigrants to large Western democracies) all demonstrating distinctive requests for official tolerance and accommodation (Kymlicka, 2007). Resulting LHR and MLR claims thus demonstrate tremendous variety in their historical and contemporary rationales, imbrication in local and national political systems, and connections (if any) to effective enforcement mechanisms. Nevertheless, since the early 1980s, such claims have assumed greater ethical and political prominence as nations strive to manage internal diversity and demonstrate concordance with international standards of respect for human rights. Tensions between the universalist and multiple group- and context particular claims remain, but theoretical unanimity is not essential for success in the realm of application. With evidence from more sophisticated argumentation along with exemplars of local and national LHR achievements, LHR proponents can continue to build the political consensus needed to elaborate and sustain language policies that reflect the aspirations toward multilingual social identities now valued within liberal democracies.

Language Study Abroad

CELESTE KINGINGER

Students, parents, educators, and policy makers often assume that study abroad is a prime context for language learning, providing “high quality, contextualized exposure” to language (Isabelli, 2007, p. 333) in abundant interaction with expert speakers. Yet, empirical evidence suggests the need for a more nuanced understanding of the relationship between study abroad and developing language ability. This entry offers an overview of research on second language acquisition (SLA) in study abroad.

In the United States, the origin of this research is commonly traced to Carroll’s claim, based upon robust statistical evidence, that “time spent abroad is clearly one of the most potent variables” predicting language proficiency (1967, p. 137). In the interval since the 1960s, scholars have explored and expanded this field of inquiry in a variety of creative ways. Their projects may be divided into two general categories: (a) research based upon holistic constructs such as proficiency or fluency, including studies attempting to correlate qualities of the experience with outcomes; and (b) research focused upon specific domains of communicative competence. Following a review of exemplary studies in each of these categories, this entry summarizes the findings while also noting limitations on the contemporary research base.

Holistic Constructs: Proficiency and Fluency

The research based upon holistic constructs includes studies examining the development of overall proficiency and of the specific qualities of fluency in speech. In the case of proficiency, the operational definition of the construct normally appears in the form of a test purporting to measure general language ability, rather than the achievement related to specific learning contexts or experiences. In the case of fluency, although the term is “deeply embedded in lay linguistic perceptions” (McCarthy, 2006, p. 2), in SLA research its definition has been elusive.

The research on the development of second language proficiency in study abroad is dominated by one model, and its accompanying test, the Oral Proficiency Interview (OPI) developed by the American Council on the Teaching of Foreign Languages (ACTFL). Since the early 1980s the ACTFL Proficiency Guidelines have provided the default understanding of general language ability in the United States. Among the projects in this subfield of applied linguistics, many have been directly or indirectly influenced by these Guidelines. A landmark study of this type is Brecht, Davidson, and Ginsburg (1995), an investigation of predictors of foreign language proficiency gain for 658 American learners of Russian. Findings from the OPI showed that the main predictors of gain included previous study of other languages, grammar and reading skills, and gender, with men more likely than women to attain the “2” (Advanced) level. A more recent study, Magnan and Back (2007), involved 20 American students of French who began their study abroad with Intermediate (“1”) proficiency. Six of the students climbed one level, and six two levels, but eight showed no gain in proficiency. The authors attempted to contextualize these findings in terms of housing options, reported French-mediated activities, age, gender, and level of prior coursework. Their analysis yielded few significant results: a negative correlation between *speaking*

French with American classmates and level of improvement, and a positive correlation between advanced level of study and proficiency growth.

Among the best known studies of fluency development is Freed, Segalowitz, and Dewey's (2004) comparison of outcomes from study abroad, domestic immersion, and "at home" classroom settings for American learners of French. In addition to participating in OPIs, the students completed a Language Contact Profile detailing the amount and type of their activity in French. Extracts from pre- and posttests were scrutinized according to a dual model of fluency: (a) as total words, duration of speaking time, and length of the longest turn; and (b) as speech rate, hesitation, pauses, mean length of speech run without dysfluencies, repetitions, or repairs. Results showed that the "at home" group's performance remained unchanged, the domestic immersion group registered significant gains on most measures, and the study abroad group made only modest gains. The researchers related fluency growth to time-on-task, with the domestic immersion students spending significantly more time in French-mediated activities than the others, and the study abroad group using English more than French outside of class in all activities except listening.

Research based on holistic constructs inevitably brings up questions about the nature of the sojourn abroad. Why do some students make significant gains while others do not? In some cases, it is possible to point out links between students' reported activities and gain scores, while in others this relationship is less clear cut. Meanwhile, efforts to refine the constructs used in research have led some researchers to abandon holistic constructs in favor of specific aspects of communicative competence.

Domains of Communicative Competence

The literature on language learning in study abroad includes numerous studies focusing on particular domains of communicative competence. These domains include: (a) *linguistic competence*, or the ability to manipulate the formal features of language such as vocabulary, syntax, morphology, and phonology; (b) *actional competence*, or the ability to interpret and produce speech acts such as requesting or apologizing; (c) *sociocultural competence*, or knowledge of rules and conventions governing language use, such as norms for politeness, speech styles, and register; (d) *discourse competence*, or the ability to create and interpret cohesive and coherent texts; and (e) *strategic competence*, consisting of knowledge and skill for resolving communication difficulties and for enhancing both learning and communication (Celce-Murcia, Dörnyei, & Thurell, 1995).

In the domain of linguistic competence, study abroad researchers have examined the development of grammatical competence, vocabulary growth, and phonology. Collentine (2004) compared overall grammatical accuracy and acquisition of unique lexical items in the OPIs of study abroad versus classroom learners of Spanish. In this study, the "at home" group outperformed the study abroad participants, demonstrating greater increases in both grammatical abilities and vocabulary growth. Studies pinpointing specific features of second language grammar offer a rosier outlook. Howard (2005) for example, limited his analysis to the realization of past tense and aspect by learners of French. While the veterans of study abroad did not master every subtle detail of the French aspectual system, in comparison to classroom learners they displayed superior control of the imperfect to mark habituality and progressivity. Similarly, Isabelli (2007) showed that study abroad alone does not guarantee acquisition of the subjunctive mood in second language learners of Spanish. However, an experience abroad provides a degree of readiness and "linguistic maturity" (p. 336) required to understand complex syntax.

Researchers interested in the effect of study abroad on vocabulary growth have produced findings dissimilar to those of Collentine (2004), showing that study abroad can expand

the learner's lexicon and render it more native-like. The participants in Milton and Meara's (1995) project, for example, showed an average vocabulary growth rate more than four times as fast as the growth rate at home, although the authors also noted important individual differences. Subsequently, Ife, Vives Boix, and Meara (2000) used a word association test to assess the organization of lexical items within the vocabularies of British learners of Spanish before and after their sojourns in Spain. Significant gains in native-like word associations were registered for all participants, regardless of their initial level of proficiency.

The development of second language phonology is normally framed as the extent to which learners appropriate native-like pronunciation. Results from research on study abroad are mixed, with some studies showing no advantages for learners abroad over their counterparts at home, and others suggesting that study abroad can bring significant enhancement to students' pronunciation. Mora (2008), for example, investigated the ability of Spanish-Catalan bilinguals to discriminate between English contrastive sound units and to produce voiceless oral stop in English. In this study, only instruction at home significantly improved students' perceptual and phonological ability. O'Brien (2004), on the other hand, showed that American students in Germany came to perceive and to pronounce German vowels in a native-like way, and native speaker judges rated their speech samples as possibly native.

The study of actional competence normally focuses on the interpretation or production of speech acts such as requesting, apologizing, or suggesting. Studies of speech act production dominate this subfield, and most involve data collection through the use of discourse completion tasks (DCTs) with comparison of learners' production with baseline native speaker data. Many investigations (e.g., Barron, 2003) suggest that study abroad is a useful, if imperfect environment for the development of actional competence; learners move toward but do not attain native-like abilities. One exemplary study is Shardakova's (2005) examination of American learners' apologies in Russian. Shardakova recruited five groups, including learners of intermediate and advanced proficiency, with and without experience in Russia, along with native speakers. In addition to completing a DCT, these participants were asked to evaluate the fictional situations portrayed in the task. Her findings suggest that *only* a combination of high proficiency and exposure to Russian culture allowed students to "see things from the point of view of a Russian" (p. 445) and thus opt to apologize in a native-like manner.

In the domain of discourse competence, one relatively well-studied phenomenon is the development of the ability to manipulate address forms (i.e., different ways to say "you"). Address forms in European languages are inherently ambiguous, since they simultaneously index both the social context and the identity of speakers. Kinginger (2008) investigated the development of address form competence (*tu* versus *vous*) in American learners of French using two instruments, formal and informal spoken role plays, and a language awareness interview requiring participants to choose an address form for each of six situations, and explain their choice. The role-play task provided a snapshot of the group's significantly enhanced ability to match address forms to contexts after a sojourn abroad. Data from the interviews showed that students had begun to appreciate the complexity underlying address form use, and that some had also understood that address form use can convey a desired social identity.

Research on sociocultural competence has focused on the extent to which students abroad develop awareness and use of register, or levels of formality that are marked linguistically. For Regan (2004), variation in the forms of negation used in French is a barometer of integration into the French-speaking community. Negation can be realized in spoken French with and without the particle "ne," as shown in the example below:

Je ne travaille pas vs. Je travaille pas
 I neg work neg vs. I work neg.
 "I am not working"

In formal speaking contexts, "ne" is generally retained, whereas in informal settings "ne" may be deleted; its presence or absence serves as a sociolinguistic indicator of formality, power, or solidarity. The advanced-level Irish students of French participating in Regan's study showed dramatic and permanent increases in "ne"-deletion following study abroad. They also demonstrated a tendency to retain "ne" in formal contexts, just as native speakers do, although they also tended to overgeneralize the deletion of "ne" in comparison with native speakers.

Kinginger's (2008) language awareness interview also included a section on speech acts for leave-taking in French, designed to assess the extent to which students would learn to match these speech acts to formal and informal communicative situations. The students were presented with a list of speech acts ranging in formality from "adieu" ("farewell," literally, "I commend you to God") to "gros bisous" ("fat kisses"), and asked to match them to a range of situations (e.g., orator to deceased at a funeral, host mother to student upon retiring for the night, applicant to interviewer at the end of a job interview). Prior to their sojourn in France, the participants made a number of inappropriate choices, such as "ciao" for the funeral orator, "adieu" to the job interviewer, or "à tout à l'heure" ("see you shortly") to the host mother on the way to bed. By the end of their semester abroad, however, most of the students had developed awareness of the relationship between address forms and formal or informal situations, and made corresponding appropriate choices.

As noted above, strategic competence includes both the ability to overcome difficulties in the process of communication and conscious strategies to improve one's own learning. Both of these angles on strategic competence are represented in the study abroad literature. Lafford (2004) investigated "attempts to overcome communication gaps" (p. 212) in OPIs involving US-based students having spent one semester learning Spanish at home and abroad. Her findings show that the study abroad participants employed significantly fewer communication strategies than did the classroom learners. Lafford attributes this difference to the "structures of expectation" (p. 213) developed in prior Spanish-mediated interaction. Whereas the classroom learners were accustomed to interaction with instructors whose mission is to assist them, the study abroad participants had experience of interlocutors more interested in their message than in their struggle to express themselves.

Adams (2006) hypothesized that study abroad would prompt changes in the learning strategies of US-based students in a variety of host countries (France, Austria, Brazil, and the Dominican Republic). Further, she argued that these changes would be influenced by program and individual variables, including self-reported gains in proficiency. Adams administered the Strategy Inventory for Language Learning before and after the students' sojourns. Her findings showed that the effects of strategy training were minimal, although students who claimed proficiency development also increased their strategy use. Of the program variables tested, only one proved significant: Students who traveled with their groups more than 20 days did not increase their use of strategies. One subtext of Adams's report is the author's astonishment in discovering that sojourns abroad of two- to four-month duration did not "challenge students appreciably more than they are challenged in the classroom" (p. 268).

Discussion and Conclusion

The research on SLA in study abroad is limited in scope and scale, with most projects involving small convenience samples of American students and difficulties in establishing true control groups (Rees & Klapper, 2008). By and large, however, and although much depends on the quality of the sojourn, study abroad appears to have a positive impact on language learning. In the case of grammatical competence, where this impact has been difficult to demonstrate, refinement of research questions has gone on to highlight the value of a stay abroad. For vocabulary growth and phonology, results are mixed: some participants present dramatic gains while others' attainment is modest. In the domains related to social interaction, the research suggests that students develop both their ability to perform and their "structures of expectation" (Lafford, 2004, p. 213) for the nature of interaction and its relation to host cultures. Where results are lackluster or mysterious, as in the case of Brecht, Davidson, and Ginsburg's (1995) findings on gender, of the apparent superiority of domestic immersion programs illustrated in Freed, Segalowitz, and Dewey (2004), or of Adams's (2006) work on learning strategies, the results call for more attention to the quality of study abroad programs, what students do with their time, how they envision present and future identities, and how they are received in their host communities.

Language Teacher Development

KATHLEEN M. BAILEY

Teachers' *professional development* has been defined as "a process of continual intellectual, experiential, and attitudinal growth of teachers" (Lange, 1990, p. 250). The term refers to teachers' need for "continued growth both before and throughout a career" (p. 250). No matter how well prepared teacher candidates may be at the end of their preservice training, throughout their professional lives they will need to update existing skills and knowledge, and add new skills and knowledge to their repertoires.

Professional development is not remediation undertaken by substandard teachers. Indeed, there is "common agreement that continued professional development is a need felt by all teachers regardless of their level of expertise and experience" (Johnston, Pawan, & Mahan-Taylor, 2005, p. 54). Smith (2005) concurs. She cites Fullan's definition of professional development as "learning how to bring about ongoing improvements" (Fullan, 1995, p. 255), and adds that professional development "needs to be an integral part of teachers' daily lives" (Smith, 2005, p. 200).

Reasons for Engaging in Professional Development

Why should busy language teachers bother with professional development? Bailey, Curtis, and Nunan (2001, pp. 6–8) suggest several reasons. First, there is the point noted above: to acquire new knowledge and skills. Teaching contexts change. People who had been working with children might begin teaching adults. Teachers working in second language contexts might move to foreign-language contexts. Political changes alter the demographics of our language learners (e.g., new waves of immigrants and refugees can create the need for new survival courses in the target language). Likewise, technological innovations and employment conditions trigger the need for professional development.

In some cases, engaging in professional development may "lead to an increase in income and/or prestige" (Bailey et al., 2001, p. 7) in a teacher's current position, or make that person more competitive in seeking a new position. Professional development can help teachers combat burnout and negativity in the workplace, and lead to empowerment—"working our way forward, based on our own understanding" (Edge, 1992, p. 1).

Bailey et al. (2001) discuss several different approaches to professional development which teachers can use, either privately or socially. These include self-observation; reflective teaching; keeping teaching journals; language learning; using video recordings; doing action research projects; creating teaching portfolios; and engaging in peer observation, team teaching, mentoring, or coaching.

Teachers' Attitudes About Professional Development Practices

Springer and Bailey (2006) conducted an online survey of over 1,200 language teachers worldwide about their reflective teaching and professional development practices. The questionnaire asked teachers to rate each activity on two 9-point scales: one about their own experience with each practice, and one about the appeal each practice held for them.

2 LANGUAGE TEACHER DEVELOPMENT

Table 1 Professional development practices: survey results

<i>Procedure</i>	<i>Experience</i>		<i>Appeal</i>	
	<i>Mean</i>	<i>SD</i>	<i>Mean</i>	<i>SD</i>
Making notes on our lesson plans	6.11	2.24	6.96	2.14
Getting feedback from our students	6.51	2.37	7.17	2.05
Discussing teaching with colleagues	6.87	1.91	7.69	1.62
Observing other teachers' lessons	5.04	2.38	7.10	2.04
Being observed by colleagues	4.07	2.36	5.97	2.38
Audio recording our lessons	2.35	2.08	4.40	2.71
Video recording our lessons	2.82	2.22	5.07	2.72
Making entries in a teaching journal	3.54	2.51	5.19	2.70
Compiling a teaching portfolio	5.96	2.81	6.82	2.46
Posting materials on a Web site	2.87	2.68	5.11	2.87
Reading cases about teaching	6.08	2.42	6.83	2.20
Writing cases about teaching	2.80	2.40	4.88	2.74
Conducting action research	3.95	2.73	5.97	2.71
Language learning experiences	7.04	2.19	7.86	1.65
Team teaching with a colleague	4.62	2.74	6.31	2.39
Being mentored by other teachers	4.55	2.64	6.92	2.23
Mentoring other teachers	5.39	2.87	7.06	2.10
Reciprocal coaching with other teachers	3.09	2.73	5.82	2.65

The results are shown in Table 1, in which the data are based on a 9-point scale (with nine representing the most experience or the greatest appeal).

In considering these data, readers should note that the higher the mean ratings, the greater the respondents' experience with that particular practice and the greater the appeal of that practice seemed to these teachers. Smaller standard deviations indicate greater consensus in the responses. Thus, for example, there was less variability in the respondents' ratings of the item "discussing teaching with colleagues" and more variability in their ratings of the item "posting materials on a Web site." It is interesting that for every single item on the questionnaire, the average appeal rating is higher than the average experience rating. Springer and Bailey (2006) interpreted this pattern to suggest that respondents found the idea of engaging in these reflective teaching practices to be potentially valuable for professional development, even if those teachers did not have much experience with the individual practice.

Principles for Promoting Professional Development

Seven principles for promoting professional development were discussed by Curtis (2008), who wrote about language program leadership. He used an alphabetical list from A to G as a mnemonic device for principles leaders should follow:

1. Articulate your awareness. This process helps teachers identify gaps in their skills and knowledge on which to focus professional development efforts.
2. Be an example. It is important for those who wish to promote professional development to engage in their own efforts.

3. Count the cost. Professional development endeavors are more likely to be supported by administrators if the results can be documented.
4. Distinguish between training and development. According to Head and Taylor (1997), training focuses on “knowledge of the topic and the methodology for teaching it” (p. 9), while development involves “the learning atmosphere which is created through the effect of the teacher on the learners and their effect on the teacher” (p. 9).
5. Engage everyone. Engaging a group of teachers in professional development involves a “subtle and complex process in which the benefits of taking part in a particular activity become clear to those who are being encouraged to take part” (Curtis, 2008, p. 123).
6. Fund your program properly, positively, and proportionally. There must be adequate proportional funding for professional development. *Proportional funding* is the idea that teachers who make a positive contribution to the organization (e.g., giving a presentation, reporting on the conference to their colleagues) should receive greater support.
7. Get senior-level support. Financial support for professional development may be easier to obtain if it reduces staff turnover, increases job satisfaction, promotes the language program, etc.

Working in the tradition of sociocultural theory, Rueda (1998) articulates five principles to guide professional development efforts:

1. Because teaching and learning are social activities, we should promote learning through “joint productive activity among leaders and participants” (p. 1).
2. Because language is an important tool for mediating interaction between teachers and learners, among learners and among teachers, we should “promote learners’ expertise in professionally relevant discourse” (p. 1).
3. Professional development should be based on authentic concerns which are relevant to the teachers involved.
4. Professional development activities should be viewed as opportunities for long-term problem solving rather than quick fixes, so such activities should “challenge participants toward more complex solutions in addressing problems” (p. 1).
5. Finally, to help teachers make connections between experientially based knowledge and formal school-based knowledge, professional development endeavors should “engage participants through dialogue” (p. 1).

These ideas from Curtis (2008) and Rueda (1998) remind us that professional development does not occur in a vacuum: “Each teacher’s practice and beliefs develop in complex interaction with experiences in school” (Roberts, 1998, p. 39).

Training and Development

Long before Head and Taylor (1997) published their distinction between training and development, Freeman (1982) provided another perspective. In his view, “training deals with building specific teaching skills,” while development, “focuses on the individual teacher—on the process of reflection, examination, and change which can lead to doing a better job and to personal and professional growth” (p. 21). Thus, training focuses on specific “immediate needs,” whereas “development assumes that teaching is a constantly evolving process of growth and change” (p. 22).

Freeman (1989) also notes that teacher education is “an interactive process involving two individuals: the teacher (or teacher in preparation) and another person—the teacher educator, mentor, colleague, or peer” (p. 38), and this person he refers to as *the collaborator*. In this context, “training is a strategy for direct intervention by the collaborator to work on specific aspects of the teacher’s teaching” (p. 39)—for example, error treatment strategies, techniques for managing group work, giving clear instructions, etc. Such training typically takes place during a given time period (e.g., a semester-long graduate course), and the success of the training is assessed by the collaborator, or by the combined judgment of that person and the teacher. Development, in contrast, involves a relationship between the teacher and the collaborator that is one of more indirect influence. It focuses on attitude and awareness as well as knowledge and skills.

Sources of Professional Development Endeavors

Efforts to promote professionalism among language teachers take many forms and can spring from at least two different starting points. Leung (2009) defines *professionalism* as “practitioners’ knowledge, skills, and conduct” (p. 49), and says that there are two broad approaches to developing teacher professionalism: (1) *sponsored professionalism* and (2) *independent professionalism*. The former refers to any “institutionally endorsed” effort, which “is usually proclaimed on behalf of teachers as a collectivity; therefore, it does not necessarily coincide with individual teachers’ views on professionalism” (p. 49). Those more individual views constitute the latter concept—*independent professionalism*.

As Leung’s (2009) contrast suggests, professional development efforts can be either institutionally or individually organized. Examples of sponsored professionalism include completion of required certification courses and in-service days provided by (and often required by) a school system or language program. Examples of independent professionalism include individual teachers taking the initiative to study a language, learn a new teaching technique, read articles, or listen to podcasts of particular interest. As these efforts are carried out, they can also be either private or social in nature. For instance, making entries in a teaching journal can be a completely private endeavor, whereas collaborating with a colleague in team teaching or action research would be inherently social. Figure 1 shows examples in the four quadrants created by these overlapping continua.

Continuing Collaborative Development

An inherently social model of professional development has been described by Edge (2002). His model of *continuing collaborative development* is a “mixture of awareness raising and disciplined discourse” and “a way of cooperation among equals” (p. 18). In collaborative professional development, learning occurs through articulating one’s experiences and concerns to a trusted colleague. That is, one teacher (the “Speaker”) articulates his concerns, ideas, and experience, while another (the “Understander”) listens. However, Edge notes that the Understander engages in a very particular kind of listening: He “accepts what the Speaker has to say and accepts the Speaker’s evaluations, opinions, and intentions without judging them according to the Understander’s knowledge or values” (p. 27). This level of acceptance leads to refinements in the articulation process: “As Speaker, I shall be trying to push my own thinking further . . . supported by the knowledge that it is acceptable for me to get things wrong while I try things out, because I have been given an evaluation-free zone to work in” (p. 32). In other words, through the process of articulating his views, the Speaker comes to new ideas which can be put into action. The Understander is also likely to benefit from this interaction.

Figure 1 Overlapping continua of professional development endeavors

Conclusion

Language teacher development is a matter of ongoing professionalism—not remediation. Regardless of their experience or initial teacher preparation, all language teachers need professional development opportunities in order to stay current with developments in the field and in the world. These opportunities may be initiated and organized by individuals (promoting independent professionalism) or by school systems (promoting sponsored professionalism), and they may be private or social in nature. Language teacher development opportunities can be greatly influenced by the climate and the leadership of the school or program within which teachers work, and there are several resources (e.g., Rueda, 1998; Richards, 2002; Curtis, 2008) to help administrators think about their roles in promoting language teacher development. For a reference list on professional development for language teachers, please visit www.tifonline.org.

Language Trainer Training in Technology

DEBORAH HEALEY

Technology in the form of electronic devices and digital media is an important part of education in most settings today. Despite what many vendors may claim, technology use is not necessarily intuitive, and effective teaching with technology even less so. Teacher training (TT) is widely seen as essential in ensuring and improving the quality of teaching with technology, including second and foreign-language teaching. For currently employed (in-service) teachers, such training is often referred to as professional development. Institutions, school districts, and Ministries of Education may invest in hiring teacher trainers to provide training. Current research indicates that the best results are obtained from long-term, ongoing training that is focused on the specific needs of those being trained (Holland, 2005; Fox, 2008). In order to provide for longer-term professional development and cut costs, investments may be made in professional development that provides training of trainers (TOT). This investment will enable local teachers to become trainers themselves, reducing dependence on outside consultants, who are often more costly, and potentially improving the fit between local needs and training. However, simply learning how to use a technology-enhanced technique or an innovation does not constitute the ability to assess trainee needs, adapt material to fit identified needs, teach others to meet those needs (perhaps with an unpredictable variety of available technology resources), and encourage others to adopt and use a technique or innovation. As a result, TOT takes a somewhat different form from TT.

Teacher education serves a similar function to TOT, but includes a number of differences. Teacher educators work with prospective teachers and generally for a longer period of time. The target for teacher educators is to help teachers better serve students, while the target for trainer trainers is to help teachers better serve other teachers. In both cases, the shift from student to colleague in the case of teacher educators and from fellow teacher to trainer can be difficult, both for master trainers and for prospective trainers (see below).

Several qualities have been noted in effective technology training and in effective training for language teachers:

1. training that meets perceived and actual needs of the language teachers;
2. a focus on language teaching and learning rather than on technology;
3. training settings as similar as possible to the teachers' own classrooms or labs;
4. use of hardware and target language software that teachers have available to them;
5. extensive hands-on practice;
6. activities that teachers can customize to fit their current textbooks and material, but also activities that can be used without customizing by teachers (e.g., material in the target language that does not need to be translated to be used);
7. use of partners ("study buddies"), preferably from the same institution;
8. ongoing training over time;
9. creation of a learning community or community of practice for ongoing support.

Elements of TOT

In this entry, those creating and presenting TOT will be referred to as master trainers. Those receiving TOT will be referred to as prospective trainers during training and as new trainers after they finish training. Those trained by new trainers will be referred to as trainees, and the students of the trainees will be referred to as students.

Needs Analysis

The first step in designing effective TOT, as in all training, is a needs analysis (Salas & Cannon-Bowers, 2003). The needs analysis will define the knowledge, skills, and attitudes desired as outcomes of the training, based on discussions with stakeholders (administrators, teachers, and possibly students, among others). Those planning the training need to know about the prospective trainers: their background in TT, level of target language proficiency, current level of expertise in teaching, teaching setting, and time available. For those being trained as technology trainers, detailed information about their experience in using technology, the technology currently available to them, and their experience specifically with technology training is also needed. The best use of TOT time is likely to be achieved when prospective trainers are at a relatively high level of skill in the areas in which they will be training others. Prospective trainers who have worked successfully with adult learners will also be at an advantage in TOT.

Those planning TOT need to have information about trainees who will be taught by the new trainers: their teaching background and setting; language proficiency; level of expertise in teaching; technology expertise; and access to hardware, software, and the Internet. Similarly, information is needed about the trainees' students' target language goals and expectations; language proficiency; technology expertise; and access to hardware, software, and the Internet. Hubbard (2007) offers a role-based framework for classroom teachers that may be helpful in defining the skills needed, based on whether the trainees will be computer-assisted language learning (CALL) practitioners, developers, researchers, or trainers. A collaborative approach to needs analysis, where feasible, provides the opportunity to develop prospective trainers' skills while ensuring a better fit for the materials and the training that is created. If the initial analysis is done by outside consultants, a more specific and collaborative needs analysis should take place during the initial TOT. Differences in operating systems and versions of software can be substantial. If trainees have access to Windows Vista, for example, they may be resistant to training on Windows XP, Windows 7, or Mac OS X. Less experienced trainers and trainees may not have the skill to use an operating system and application menus in a language different from that on their own computers, such as in English rather than in Arabic.

Behavioral Objectives

The next step is to establish behavioral objectives (also called performance objectives and learning objectives) based on the needs analysis and that clearly define what prospective trainers, trainees, and their students will be able to do. Behavioral objectives are observable and measurable (Smaldino, Lowther, & Russell, 2007). Objectives and their related assessment methods should be established for the TOT sessions, mentored training, and new trainer sessions, with a focus on how language teaching pedagogy can be enhanced with technology. Training for language teachers about technology can devolve into technical training if a consistent focus on pedagogy is not maintained (Levy & Stockton, 2008). Behavioral objectives and a clear assessment strategy help administrators as well as prospective trainers and trainees understand what the outcomes of the training are expected to be, including what trainers should be able to do as a result of the training. Buy-in from

administrators and prospective trainees helps build momentum and the likelihood of success for the overall training effort.

Training for technology use in language teaching can be informed by using the TESOL *Technology Standards* (Teachers of English to Speakers of Other Languages, 2009) as a reference. Selected performance objectives from the *Technology Standards* can be adapted to serve as the basis for behavioral objectives. For example, Goal 1 Standard 2 is “Language teachers demonstrate an understanding of a wide range of technology supports for language learning and options for using them in a given setting” (p. 29). One of the performance objectives is “Language teachers use online technology as available to deliver instructional or support material” (p. 29). A behavioral objective for prospective trainers based on that standard and performance objective would be, “After creating their own blog with a language class in mind, prospective trainers will create instructions for creating and using a blog for a language class, including graphics, step-by-step instructions, and a rubric for assessing blog posts.” A behavioral objective for trainees would be, “After reading about the use of blogs in language teaching, trainees will create a blog for their class and post an initial welcome message that explains the purpose and use of the blog.”

Materials Development

With behavioral objectives in mind, materials development is next. Materials used in TOT are designed for prospective trainers and for their trainees. Background readings work well to set the pedagogical stage for discussion and hands-on practice. Again, a collaborative approach to materials development with master trainer and prospective trainers is recommended whenever possible in order to improve the likelihood that the material will be appropriate for the trainees and meet the language learning needs of their students. A collaborative approach is especially helpful with technology training for language teachers, where the target language proficiency of trainers and trainees as well as the resources available to them are considerations. Examples that resemble the trainees’ own situations work best (International Trade Centre, 2005; Davis, Preston, & Sahin, 2009). Training situations that present ideal conditions do not reflect trainee realities, leading to frustration when trainees try to implement language learning technologies and tools in their classrooms. As Hubbard and Levy point out, “the best preservice and inservice professional development courses build authentic constraints into the tasks trainee language teachers are required to complete” (2006, p. 8).

TOT material, based on the needs analysis, should be as explicit and as extensive as possible in order to be effective. Screenshots and step-by-step instructions are useful, as are scripts for prospective trainers. Scripts should be in the language most likely to be used in the training setting, also taking into account possible differences in the language that the operating system and menus may appear in. For those using PowerPoint, the Notes function allows the inclusion of a script with each slide. Some versions of PowerPoint will export the notes with a thumbnail of each slide as a Word document, creating an easy handout for new technology trainers to use. Sometimes the expertise of the prospective trainers with materials development is relatively modest, and time is limited. In that case, master trainers should develop TOT materials and be prepared to revise them during initial training. Where trainers and trainees use a mixture of software versions, operating systems, or languages, those planning training have to be prepared with “cheat sheets” that show correspondences and that can be used for reference.

Training topics are based on the needs analysis. Technology training for language teachers typically includes software and online resources for the following:

- language skill building: authentic and adapted material and exercises (reading, writing, listening, speaking, vocabulary, grammar, and pronunciation);

- teacher tools, including lesson plans, gradebooks, and authoring programs;
- specific technologies and tools such as using video, from taking videos to editing the final product; interactive whiteboards; concordancing; online teaching; and so forth;
- language teaching approaches, from basic methodology to specific areas such as critical thinking, differentiated instruction, languages for specific purposes, and so forth;
- community building for language teachers and for language learners;
- research methods, especially classroom-based research.

Training Sessions

Some TOT and TT sessions will make use of peers from the same institution as learning partners (“study buddies”) during training. When partners from the same institution are not available, participants in the training courses can be organized into pairs or small groups. The goal in either case is to create a community of practice (Wenger, 1997; see Hanson-Smith, 2006, for technology-related communities of practice for language teachers). A local community of practice that provides ongoing, long-term support for trainers and trainees can help achieve desired educational changes. Where feasible, virtual communities established and used online during the TOT and new trainer sessions can, if managed appropriately, be very effective in providing ongoing, long-term learning even when participants are from different institutions (Kearsley, 2008).

Modeling Best Practices

Effective TOT sessions model the same best practices in teaching the prospective trainers as the new trainers will be expected to use with their own trainees. Implementation of best practices in adult learning (Knowles, 1980) includes:

- tying the learning directly to participants’ needs;
- involving learners with interactive presentations and methods of encouraging interaction in large groups;
- providing variety to meet different learning styles;
- formative assessment that provides positive feedback;
- treating learners as individuals (Sullivan, Wircenski, Arnold, & Sarkees, 1990: ID 1–2).

These are all considered elements of good language teaching. Using interactivity, group work, and varied learning styles during training and calling attention to their use builds language pedagogy along with technology skills. In many settings, the target language proficiency level of the prospective trainers and the trainees will be quite varied. Whether the focus of training is language skill building or technology, adding resources and activities that build language skills of prospective trainers and trainees is helpful.

Relatively few participants may be involved in the TOT sessions. However, it is very likely that the new trainers will be working with much larger groups of trainees. Given large class sizes in many parts of the world, the trainees may also need to be equipped with methods for dealing with large language classes. Trainees may be more likely to have access to technology at home than at work and to be working in a one-computer classroom than with a lab. A good needs assessment will make tying the learning to participant needs easier.

Hands-On Practice

As with language learning, practice is a critical part of technology training. Most TOT and TT takes place in computer labs in order to maximize the number trained. If the needs

analysis shows that most of the trainees will have access to a one-computer classroom rather than a lab, it is important to build in time for practice in that setting. A workable option can include setting up a microteaching environment with one computer and a projector where prospective trainers and trainees take turns presenting to each other for 10–15 minutes. Training that takes place in the trainees' own setting, sometimes called situated learning (Egbert, 2006), is most clearly relevant. In-house training can be best customized to meet teachers' needs: suited to the school's basic pedagogical approach, class size, trainees' and students' language proficiency level, technology resources, and the like.

A common failing in technology training is overly helpful trainers and even fellow trainees who will take over the learner's mouse and keyboard to move the learner along. Modeling best practices in technology training includes having those doing the teaching take a "hands-off" attitude toward the mouse. Those being trained need to do, not to watch, when they need additional help. The teacher can model, but then should put the computer or program back into its previous state so that the learner can perform the same operation himself or herself. Trainers and language teachers may also need practice to familiarize themselves with the target language used in specific technology tools of interest. Having menus in the target language is another way of building vocabulary, but it also means learning the target language for a specialized use.

All TOT should include an opportunity not only for hands-on practice during training sessions, but also for mentored practice with trainees. For one example, see Rickart, Blin, and Appel (2006) and the Organizing In-Service Training for Language and Technology in Education (OILTE) TOT project in Ireland (see www.oilte.ie for extensive information about this). Mentored practice is commonly implemented in teacher education programs as part of a practicum. It is also an important element in TOT. The more extensive the change, the more necessary mentored practice will be. In TOT, it is especially important for master trainers to give feedback on the ability of prospective trainers to use the material and techniques appropriately with others. Mentored training also allows master trainers to work collaboratively with new trainers to further refine material, both for future TOT sessions and for use by the new trainers in their TT. Mentored practice that takes place in the new trainers' own settings provides master trainers with the best opportunity for focused feedback on methods and materials.

Assessment

Assessment of TOT material and of training is made with prospective trainers, their trainees, and the trainees' students in mind. A type of assessment commonly used in training is the four-level Kirkpatrick evaluation system (Kirkpatrick, 1996). Prospective trainers can evaluate the TOT sessions from the standpoint of their personal opinion, or a Kirkpatrick Level 1, Reaction level. Mentored training sessions allow assessment at Kirkpatrick Level 2, Learning. The full value of TOT sessions is not visible, however, without observing whether or not there are changes in practice at the trainees' level, in their classroom teaching: Kirkpatrick Level 3, Behavior (Performance). If enough teachers begin using the new techniques or material, the change can become institutionalized: Kirkpatrick Level 4, Results. Assessment at the first two levels can be effective in the short term; for levels 3 and 4, assessment should be long-term.

Challenges

TOT is especially challenging because of the multiple levels of attention required. Master trainers must meet the needs of prospective trainers, new trainers, the trainees of the new

Table 1 Multiple levels of attention

For master trainers
• Viewing prospective trainers as trainees • Viewing prospective trainers as trainers • Creating and assessing TOT material, possibly for multiple platforms, versions, languages, and operating systems • Creating and assessing end-user training material, possibly for multiple platforms, versions, languages, and operating systems • Assessing the trainees during TOT training • Mentoring the new trainers • Assessing the new trainers as they operate independently
For new trainers
• Changing from trainees to mentored trainers • Changing from mentored trainers to working independently • Assessing TOT material for fit in their setting • Assessing and adapting or revising end-user training material to meet the needs of their trainees • Assessing trainees • Examining end results with students trained by trainees

trainers, and the students of the trainees. Trainers, especially if participating in co-creating material, need to pay attention to the needs of trainees and the students of the trainees. Technology is a moving target, adding further complexity to the mix (see Table 1).

Classroom teachers are often used as trainers. Those accustomed to working with young children may find it particularly difficult to shift to having adult colleagues as their students. Difficulties may also arise with trainers who are young or from groups that are not typically trainers (e.g., women and members of nondominant groups). In language training, those who do not speak both the target language(s) and the language(s) of the prospective trainers and the trainees may face difficulties. They may be hard-pressed to be accepted as trainers or as master trainers, no matter how proficient they are with the training topics, by those who are older, from dominant groups, or with better language skills. A certificate of training may be useful in many cases to provide the necessary sense of “qualification,” especially if the certificate is recognized by the local educational authority.

TOT and TT sessions often have financial and time constraints that limit the amount of training available. The longest-lasting results are found from training that is ongoing rather than “inoculation-style.” The TALL Project (Meskill, Anthony, Hilliker-VanStrander, Tseng, & You, 2006) used a combination of doctoral students and experienced classroom teachers trained as mentor teachers. They mentored novice teachers who were implementing technology over a three-year process. This proved to be a successful approach in many ways. TOT sessions with several follow-up sessions, regular TT, and use of a community of practice with regular face-to-face or online interaction require ongoing administrative support.

In sum, TOT requires attention at several levels: master trainer, prospective trainer, new trainer, trainee, and student. Implementation has both immediate and long-term impacts. Training results are seen during TOT work, in mentored training, and then in the work of trainees in their classrooms. Value ultimately lies in the effects on trainees’ students: a distinctly long-term view.

Language Learning and Teaching: Overview

LOURDES ORTEGA

A vibrant sector of applied linguistics is concerned with generating systematic knowledge that can support people who formally study an additional language, that is, a language other than the one(s) they learned at home through primary socialization prior to schooling. Research into the formal study of languages, which happens worldwide across multifarious contexts, demands attention to the two ends of language education: *learning*, which means inquiring into processes and influences as language apprentices experience them in formal education settings, and *teaching*, which means focusing on the design and practices of educational delivery systems including instructional approaches, materials, teachers, and programs. Simultaneous consideration of teaching and learning is a must in the investigation of how additional languages are acquired in formal settings. The two perspectives are inseparable, yet distinct, and they interact in a complementary fashion. They are explored in the 83 entries comprising Language Learning and Teaching, the largest area by far in the encyclopedia. The theoretical and disciplinary roots that inform research into the learning and teaching of additional languages originate in the field of second language acquisition (SLA) and other fields in applied linguistics at large, and readers can also consult many relevant entries in other areas of this encyclopedia.

Contexts and Populations

Knowledge about language learning and teaching is shaped by the diverse reasons and the educational goals involved in wishing or needing to study an additional language. Reasons and goals for study, in turn, pattern along contextual constellations associated with sociocultural milieus of specific language-learner populations and the varied affordances and limitations they experience as a result of at least two important macro-level influences: the educational policies under which students, teachers, and programs exist, and the differential power relations that bond and separate the target and societal languages. Applied linguists and language educators agree that a one-size-fits-all approach to instruction and language education cannot serve language learning well. While certainly sharing many characteristics, each context also presents differing needs, affordances, and challenges.

The study of language is part of the official curriculum of most school systems around the world and many, though not all, of these school-age populations learn under a mixture of positive and negative conditions that can be thought of as elective bilingualism: on the one hand, access to the target language is limited and motivation to learn the language for some immediate material or even symbolic reward may be low. On the more positive side, support for the students' first language development continues alongside additional language learning and the target language does not pose an immediate threat to these students' home languages. English enjoys a special status in the official school curriculum as an international language of transnational and intranational communication and as a tool for economic and scientific advancement. Many research insights are therefore available in TEACHING ENGLISH AS A FOREIGN LANGUAGE IN KINDERGARTEN TO 12TH GRADE,

2 LANGUAGE LEARNING AND TEACHING: OVERVIEW

although unresolved controversies also exist. A much investigated controversy pertains to the ideal age for the onset of formal study of English and other foreign languages. Increasing research consensus suggests that more important than the starting age is ensuring AGE-APPROPRIATE INSTRUCTION AND ASSESSMENT FOR SCHOOL-AGE LEARNERS and supporting sustained levels of motivation throughout the school years. Besides English, many other foreign languages are taught to schoolchildren worldwide, and these contexts offer their own challenges, particularly because goals for learning languages other than English change with global trends such as migration and with key historical events stemming from conflicts among nations and defense interests. US FOREIGN-LANGUAGE TEACHING IN KINDERGARTEN TO 12TH GRADE, for example, has been characterized by great progress in the realm of standards and assessment coupled with unmet needs to develop a high-quality teacher task force in a wide range of foreign languages. These trends and challenges are true of the teaching of traditional foreign languages such as French, German, and Spanish, but they are particularly relevant when TEACHING LESS COMMONLY TAUGHT LANGUAGES (e.g., Arabic, Chinese, Japanese, Korean, and Russian).

Student populations learning language in contexts for elective bilingualism contrast with many diverse populations of children, youth, and adults around the world's geography who are already speakers of languages other than the majority language of their surrounding society. They engage in language learning under conditions of circumstantial bilingualism involving inequalities and differential sociocultural capital and socioeconomic power. The learning needs and goals of these heterogeneous populations, particularly during the formative years of schooling, are the focus of EDUCATIONAL RESEARCH IN LANGUAGE MINORITY STUDENTS, which has revealed instructional imperatives associated with fundamental language and education rights. Among other imperatives, there needs to be formal support for first language development and use so as to ensure that language minority students develop multiple-language capacities, not just competencies in the majority language. A simultaneous goal must be the development of academic registers in the majority language, since language mediates academic achievement. Effective ways to support academic language development have been systematically investigated by SYSTEMIC FUNCTIONAL LINGUISTIC APPROACHES TO TEACHING ENGLISH-LANGUAGE LEARNERS. Research-based best practices and approaches also exist for TEACHING ADOLESCENT AND ADULT LANGUAGE LEARNERS WITH LIMITED OR INTERRUPTED FORMAL SCHOOLING and to address LANGUAGE AND EDUCATION FOR RETURNEES, who are youth and adults in need of effective support for additional language learning upon repatriation, after having spent a significant portion of their lives in a host society.

Because the attainment of competence in multiple languages through formal instruction is valued as an asset for all, applied linguists have also been interested in generating knowledge that improves access to multilingualism for individuals who experience a range of language-specific difficulties when confronted with the formal study of a language. Cognitive, first language, and affective factors appear to contribute to these difficulties, which for some individuals in some educational systems can be formally diagnosed as a disability such as dyslexia. Causes and educational responses have been addressed by applied linguistics research. The interest in supporting foreign-language education in the United States has led to a wealth of insights for FOREIGN-LANGUAGE TEACHING FOR STUDENTS WITH LANGUAGE-LEARNING PROBLEMS, whereas in Europe the special role of English among all foreign languages has given way to research in TEACHING ENGLISH AS A FOREIGN LANGUAGE TO STUDENTS WITH SPECIFIC LEARNING DIFFERENCES.

Optimal learning and teaching approaches for at least three more distinct populations are objects of intense study: HERITAGE LANGUAGE TEACHING, which is provided to learners who seek study of a target language with which they have personal, community-based connections because it is the language of their ancestors and often the home language they

learned and partially lost in the early years of life; TEACHING INDIGENOUS LANGUAGES, which involves students who wish to invest in a language of their heritage which is less commonly taught and under siege, linguistically and culturally, from the surrounding majority language; and TEACHING A SECOND OR ADDITIONAL DIALECT, which addresses the rights of many student populations around the world who engage in formal language learning of varieties of the same language used by different national, regional, or social groups to which the students may wish or need access.

Finally, study of the complex and varied landscapes for additional language learning in formal contexts has given way to the realization, spearheaded by the language-learning-and-teaching research community in Europe, that most language learning during late childhood and adulthood involves becoming functional in not just two, but three or more languages. Accordingly, increasingly more scholars have begun to generate educational and psycholinguistic research on TEACHING A THIRD LANGUAGE.

Theoretical and Disciplinary Foundations

It is important to note that the ROLE OF INSTRUCTION IN SECOND LANGUAGE ACQUISITION THEORIES can vary greatly, with some theories allowing for a quite limited to no role at all for formal teaching, and other theories according instruction an important role for reasons that may differ slightly or greatly from theory to theory. Nevertheless, researchers in INSTRUCTED SECOND LANGUAGE ACQUISITION believe formal instruction can support second language development in a number of theoretically meaningful ways and therefore have devoted themselves to contributing insights about how best to support language learning in formal contexts. Most research efforts have revolved around the appropriate balance between the provision of explicit knowledge through various options for grammar instruction and the facilitation of opportunities for developing implicit knowledge via communicative and meaning-oriented instructional techniques. This body of research has led to the articulation of a proposed psycholinguistic balance called FORM-FOCUSED INSTRUCTION. Many of the findings regarding what to teach and best principles, techniques, and processes in the language classroom presented in the next two sections of this overview are associated with this disciplinary tradition and must be understood in conjunction with the HISTORY OF LANGUAGE TEACHING METHODS, which clearly shows how historically grounded conceptions of what language is have led to different interpretations at different times of not only how to teach but also what dimensions of language to prioritize for teaching. The empirical base for this knowledge also draws on CLASSROOM RESEARCH and rests on research methodologies for MEASURING THE EFFECTIVENESS OF SECOND LANGUAGE INSTRUCTION IN RESEARCH that increasingly consider the need for both rigorous and ecologically valid research practices.

What to Teach

Traditionally, language learning in formal contexts has been designed around the teaching of the nuts and bolts of language. TEACHING GRAMMAR has always been a central focus of study, and the application of CORPUS LINGUISTICS IN LANGUAGE TEACHING has greatly facilitated rapid innovations in this area. The idea that regulation of one's own learning is important and therefore instruction ought to include learning how to learn emerged early in the field and although TEACHING LANGUAGE-LEARNING STRATEGIES is not always contemplated as a formal element in language programs, recommendations and studies exist to guide those interested in this area. By the late 1980s, the advent and expansion of communicative language teaching brought into professional focus the need to investigate

4 LANGUAGE LEARNING AND TEACHING: OVERVIEW

approaches that might support the development of second language skills, and many programs nowadays are skill-based and have spurred ample research on TEACHING READING, TEACHING LISTENING, and TEACHING WRITING. A more holistic perspective is preferred in contemporary skills-based language courses, where TEACHING INTEGRATED SKILLS offers an alternative to teaching each skill in isolation. TEACHING LITERACY and LEARNING TO READ IN NEW WRITING SYSTEMS present knowledge bases for a more educationally oriented and a more psychologically oriented perspective on instructional treatments of reading/writing development, respectively. Even though all teachers and students also recognize the centrality of words in the study of a new language, it was not until the 1990s that research on TEACHING VOCABULARY saw a mobilization toward generating and accumulating systematic insights. It now offers precise insights as to what words should be learned and taught at different stages of the learning process and what learning goals are feasible or desirable depending on the target needs of different language students. An even more recent research development is empirical attention to TEACHING PRAGMATICS, heeding the known fact that language-learning outcomes are satisfactory only if language students learn to recognize and enact social functions appropriate to user intentions and context expectations.

Contemporary professional practices acknowledge that language-learning outcomes must go well beyond acquiring linguistic knowledge (e.g., grammar, vocabulary, pragmatics), abilities for accessing and integrating that knowledge into fluent language use (e.g., reading or listening skills), or tools for the development of self-regulation in learning (i.e., learning strategies). In many programs and for many student populations, TEACHING CULTURE AND INTERCULTURAL COMPETENCE, TEACHING FOR LANGUAGE AWARENESS, TEACHING FOR INTERNATIONALIZATION AND CRITICAL CITIZENSHIP, and even TEACHING LANGUAGE FOR PEACE have found an important place. A particularly important position in this regard is CRITICAL PEDAGOGY IN LANGUAGE TEACHING, which conceives of social justice as one of the learning goals that language teachers and students can achieve together while engaging in the learning of a language.

Principles, Techniques, and Processes in the Language Classroom

Research on language learning and teaching has addressed many of the central questions that language teachers pose themselves as they strive to deliver appropriate language instruction. Among other questions, teachers ask themselves what is the value of drawing on EXPLICIT KNOWLEDGE AND GRAMMAR EXPLANATION IN SECOND LANGUAGE INSTRUCTION, whether and when USING METALANGUAGE IN TEACHING is advisable, and whether USING THE FIRST LANGUAGE AND CODE SWITCHING IN SECOND LANGUAGE CLASSROOMS harms or supports classroom second language development.

In terms of key ingredients for language learning, the evidence offers support for INPUT-BASED INSTRUCTIONAL APPROACHES, since a language must be learned by comprehending and processing large amounts of meaningful linguistic input. There must also be attention to creating opportunities for learners to use language productively in ways that they themselves initiate, and OUTPUT-BASED INSTRUCTIONAL APPROACHES can provide language teachers with guidance for why and how to do this. PRACTICE IN SECOND LANGUAGE INSTRUCTION is also an important ingredient for optimal language learning, although the idea that practice makes perfect has been qualified by psycholinguistic theories and empirical research and it is clear now that meaningful, deliberate, rather than mechanical practice supports language learning. Related to the contributions to learning of input, output, and practice, all language teachers struggle over fruitful ways to address (or, alternatively, ignore) language choices that are infelicitous in certain contexts, for example, an examination or

a high-stakes encounter such as a job interview. Much research addresses **ROLES FOR CORRECTIVE FEEDBACK IN SECOND LANGUAGE INSTRUCTION** and suggests options that teachers can consider in light of their own philosophies of teaching and their understandings of the importance of linguistic accuracy in their given educational contexts. Finally, research consensus has been reached that not everything that teachers might want to teach will be learned by their students and, conversely, that not everything that students learn comes from what their teachers teach them. Instead, when it comes to grammatical competence at least, **LEARNER READINESS** to learn developmentally appropriate language must be considered.

The research base in all the areas mentioned thus far in this section should not be thought of as definitive, particularly since the psycholinguistic and socioeducational complexities involved in each question are daunting. Nevertheless, SLA researchers who investigate language instruction from these perspectives have directed energetic efforts at slowly but surely accumulating evidence supporting particular claims about teaching and learning, and much progress has been made toward general principles that attract research consensus, and whose relevance for informing language classroom practice teachers can evaluate contextually and flexibly. More recent pedagogies hold that cognitive development and knowledge development are firmly rooted in the social world, and so is language learning. They focus less on the key instructional ingredients for enabling psycholinguistic processes that may support linguistic development and instead offer empirical reasons for cultivating language classroom communities that are conducive to learning to mean and communicate. Such classroom communities must encourage **DIALOGIC INQUIRY AND TEACHER TALK IN SECOND LANGUAGE CLASSROOMS** and capitalize on **COLLABORATIVE LANGUAGE LEARNING** during oral group work and on **PEER RESPONSE IN SECOND LANGUAGE WRITING** during written work, which need not be seen as a solitary endeavor.

Given the high premium placed on active engagement and learner-initiated behaviors in sociocultural proposals and traditional form-focused instruction alike, it is important to appreciate the multiple and negotiated significance of **SILENCE AND PARTICIPATION IN THE LANGUAGE CLASSROOM**, and to heed research insights that suggest student silences must be interpreted culturally and contextually and are not always a sign of lack of engagement or, even worse, lack of learning.

Types of Language Programs

There is a wealth of ways to organize and systematize the delivery of language instruction into programs. The thrust of bilingualism as a valued asset for the citizenry in any country has resulted in **BILINGUAL EDUCATION**, a much misunderstood term that can be used to denote rather heterogeneous programmatic designs, originally created to serve the circumstantial bilingualism needs of minority language students by ensuring the development of the majority language (often English) without sacrificing competence in the minority language spoken in homes. **IMMERSION PROGRAMS** respond to the same goal of supporting bilingual competence but historically evolved out of a desire to serve the elective bilingualism needs of majority language students. They have grown in scope and educational mission since then.

Both bilingual and immersion proposals hold that a fruitful option for learning an additional language is when language and content are learned simultaneously in a mutually supportive relationship. In recent years, this rationale has led the way to many initiatives for **CONTENT-BASED LANGUAGE INSTRUCTION** (also known as content and language integrated learning in Europe). The most coherent theoretical rationales in support of the **INTEGRATION OF LANGUAGE AND CONTENT LEARNING** have been developed by systemic functional

linguists. Another rationale at the heart of bilingual and particularly immersion programs is that the richest opportunities for language learning arise when students can be surrounded by linguistic input that is meaningful and plentiful, that is, afforded by many interlocutors and in many content domains not represented in a traditional classroom and with great and sustained intensity typically not achieved in a traditional program. This rationale has crystallized in popular and well-researched LANGUAGE STUDY ABROAD opportunities that configure themselves into full programs or are offered as add-on experiences to complement language programs at home.

There are many other types of language programs, many of them associated with the learning of English as a foreign language. They may be designed around certain desired learning outcomes, such as the development of textual and discourse competence in GENRE-BASED LANGUAGE TEACHING or the development of academic registers in TEACHING LANGUAGE FOR ACADEMIC PURPOSES. Programs can also be designed around particular outcomes that are relevant for certain professions that make central use of English, such as when TEACHING BUSINESS ENGLISH or TEACHING ENGLISH FOR MEDICAL AND HEALTH PROFESSIONS. A special type of language program designed with professional language outcomes in mind is the case of TEACHING TRANSLATION AND INTERPRETING.

Programmatic Thinking

In light of the daunting array of possible instructional practices and language programs that are found around the world, applied linguists and language educators are in need of research that illuminates programmatic thinking. Programs should originate in NEEDS ANALYSIS, require careful thought on SYLLABUS DESIGN, and demand expertise in PROGRAM EVALUATION. Research on INNOVATION IN LANGUAGE TEACHING AND LEARNING offers important insights about the conditions that hinder or enable the satisfactory functioning of all these elements of a program and provides empirical guidance for promoting positive and needed programmatic changes over time.

A particular concern for the design of effective language programs is LARGE-SIZED LANGUAGE CLASSES, for which the empirical evidence is scant. High levels of professional activity but also limited actual research are available in the important programmatic dimension of MATERIALS DEVELOPMENT. For some languages such as English, language-teaching materials are tremendously profitable and MATERIALS PUBLICATION can be a particularly fulfilling extension in a teacher's career. Recent research insights are available that support the use of GRADED READERS as a good option for reading materials. Applied linguistics scholarship also encourages teachers and materials developers to critically and creatively consider reasons for USING POPULAR CULTURE IN LANGUAGE TEACHING and ways in which AUTHENTICITY IN THE LANGUAGE TEACHING CURRICULUM can support or misguide language pedagogy.

Impact of Technology in Language Teaching

The explosion of technology in contemporary societies has transformed education in almost every corner of the world. Research on INSTRUCTIONAL COMPUTER-ASSISTED LANGUAGE LEARNING provides evidence that language educators as well can harness the rich affordances of technology for language learning and heighten student motivation in the process. Theories of SLA guide the incorporation of new technologies into a myriad TECHNOLOGY-SUPPORTED MATERIALS FOR LANGUAGE TEACHING and teachers can extend instruction inside and outside the language classroom by USING THE WORLD WIDE WEB FOR LANGUAGE TEACHING. A particularly successful approach to doing this has been ONLINE INTERCULTURAL EXCHANGES.

Learner autonomy can be boosted via SELF-ACCESS AND INDEPENDENT LEARNING CENTERS that have been transformed by technological innovations, whereas increasingly more educational contexts have expanded or even replaced face-to-face, traditional language instruction with FOREIGN-LANGUAGE DISTANCE LEARNING PROGRAMS that bring the possibility of multilingualism to students who can form language-learning communities dispensing with the need to be gathered in the same physical classroom.

Language Students and Teachers as Agents

Language learning and teaching can only be illuminated if students are investigated as multidimensional people who negotiate and achieve their educational goals with full intentionality and agency. Research on AFFECT AND LANGUAGE TEACHING shows the importance of not only cognition and social factors, but particularly positive emotions stemming from the ambivalent complex of attitudes, motivation, and anxiety that students experience when learning a language. Successful language learning is fostered when positive affect is negotiated by all members of a classroom community. Affect and other sources of INDIVIDUAL DIFFERENCES IN THE CLASSROOM, such as sense of self, can be difficult to investigate because they are dynamic and interpersonal, that is, contextually and socially produced through lived and reflected-upon language experiences in the classroom. It is for this reason that applied linguists interested in individual differences are increasingly turning to dynamic systems, poststructuralism, and sociocultural anthropology in order to make sense of them. Particularly important has been recent scholarship on IDENTITIES AND LANGUAGE TEACHING IN CLASSROOMS, which shows important ways in which students' self- and other-positioning is dynamically shaped by power struggles that traverse classroom and wider society. Identity stakes mediate the learning that is fostered or hindered in the course of formal language education.

Teachers cannot be forgotten either, as they are main agents in language teaching. Teacher identities and professional knowledge are supported by research on LANGUAGE TEACHER DEVELOPMENT, which offers principles for designing preservice professional development and sources to enable continuing professional growth and renewal. The needs for BILINGUAL/IMMERSION TEACHER EDUCATION, in particular, have been articulated in recent scholarship and await future empirical attention. A neglected yet central part of language teachers' professional need is to develop effective tools for engaging in ADVOCACY IN LANGUAGE TEACHING. Teacher advocacy is needed to address self-empowerment issues. For example, probably the largest body of language teachers comprises NON-NATIVE-SPEAKER ENGLISH TEACHERS, and their struggles against linguistic and professional discrimination have resulted in a number of advocacy initiatives which have prompted remarkable changes in the profession. Increasing teachers' capacity for effective advocacy can also benefit their language students, particularly in cases when teachers can support students and parents in asserting their rights to language education. The chronicle of LEGAL DISPUTES OVER SECOND LANGUAGE INSTRUCTION IN THE UNITED STATES vividly proves this point. Ultimately, good language teaching requires self-awareness of the importance of ideologies and beliefs in education, and recent scholarship on VALUES IN LANGUAGE TEACHING has begun to investigate this under-researched dimension of language learning and teaching.

Biographies of Key Contributors

The Language Learning and Teaching area also includes the biographies of twelve key contributors to scholarship on instruction and language education: Dick ALLWRIGHT, Heidi BYRNES, Donna CHRISTIAN, Zoltán DÖRNYEI, Stephen KRASHEN, Patsy M. LIGHTBOWN, Roy

LYSTER, Sandra MCKAY, David NUNAN, Nina SPADA, G. Richard TUCKER, and Bill VANPATTEN. Biographies for a good number of other scholars who have contributed seminal research in this domain have been included in other areas of the encyclopedia.

Language Learning and Teaching: Mixed Methods

MARTIN LAMB

Introduction

Creswell (2009) has pointed out that “mixed method thinking” is ubiquitous in everyday life, with media investigations routinely mixing quantitative and qualitative reports on contemporary events. For example, a natural disaster will be reported both in terms of numbers (e.g., of casualties, cost to the local economy) and in terms of individual stories (e.g., of victims, local politicians’ intentions), in the belief that this dual perspective helps viewers better understand the event. In academia, mixed methods research is increasingly accepted as a legitimate approach to addressing issues in the social sciences (e.g., Tashakkori & Teddlie, 2010).

Mixed methods investigations usually take one of two forms: They are either large-scale studies by a team of researchers which includes at least one specialist in each type of research (e.g., Dörnyei, Durow, & Zahran, 2004; Malderez, Hobson, Tracey, & Kerr, 2007), or they are small-scale investigations carried out by single researchers less committed to a particular tradition and mixing methods in creative and, to some traditionalists, not always very principled ways. This entry describes the latter type of mixed method study, carried out by me as a doctoral student. While I would claim that the study was creative *and* principled, I should acknowledge at the start that it shares some of the limitations of many small-scale mixed methods studies in that the quantitative (QUAN) and qualitative (QUAL) strands alone might not have met some of the quality criteria applied within those paradigms. I will argue that by combining the two types of data at various stages, the study as a whole did provide trustworthy results, as reported elsewhere (Lamb, 2004a, 2004b, 2007b, 2009).

The Study

From August 2002 to March 2004 I conducted a longitudinal study tracking the motivation to learn English of a single cohort of students beginning formal study of the language at a junior high school (JHS/SMP) in a provincial Indonesian city. The precise research questions, which remained largely unchanged from beginning to end, were:

- RQ1. How motivated are the students to learn English when they enter the JHS?
- RQ2. How does this motivation change during the first two years of JHS?
- RQ3. What factors are associated with changes in motivation over this period?

At the time I was embarking on the study, major new qualitative studies of L2 motivation were appearing, to complement or challenge the more traditional psychometric approaches. I was therefore receptive to Dörnyei’s (2001) call for more mixed method studies, to bolster the strengths and compensate for the weaknesses of both quantitative and qualitative approaches. So although my research questions were posed in a largely

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

© 2013 Blackwell Publishing Ltd. Published 2013 by Blackwell Publishing Ltd.

DOI: 10.1002/9781405198431.wbeal0650

positivist style and could have been addressed through traditional quantitative methods, I interpreted them more broadly. In asking “how motivated?” I was not referring solely to the students’ position on a predetermined scale but genuinely seeking out the nature of their motivation. “Motivational change” did not refer specifically to numerical differences but to possible qualitative changes too. And the “factors” that might have influenced their motivational change were not preset but were to be sought in the data.

Methodology

My research design was QUAL + QUAN, with both elements having roughly equal status and, as a longitudinal project, running concurrently (see Dörnyei, 2007). The learners (n = approximately 220) were surveyed using my own questionnaire at the beginning (August 2002) and end (March 2004) of the research period. Both questionnaires had the same single items with a three-point Likert scale targeting five different aspects of L2 motivation (intrinsic, instrumental, integrative, parental pressure, academic goals), plus satisfaction with progress, expectation of ultimate success, attitude toward the experience of learning English, and perceived importance of English, along with other items relating to English outside school. For some of these items, respondents were asked to explain their reasons for their response in an open box. A group of 12 “focal” learners was selected in September 2002; they were interviewed at three points in time, were observed in class, and were asked to write “learning journals.” Interviews were also conducted with the

Table 1 Data collected for the study

<i>Type of data</i>	<i>Quantity</i>	<i>Main method of analysis</i>
Questionnaires	220 + 250	• Scores calculated to answer RQ1 (see Lamb, 2004a) • Comparison of scores of respondents who completed both questionnaires (see Lamb, 2007b) • Open items coded and quantified, with totals for each category of response compared at beginning and end (see Lamb, 2004a; Lamb, 2007b)
Audio-recorded interviews with learners	12 + 12 + 11 (= ca. 12 hrs)	• Matrix constructed to compare responses to the same prompts by different learners, and by the same learner in each interview • Coded for topics and themes (see Lamb, 2004a, 2007b) • Individual accounts matched with other data to build detailed portraits (see Lamb, 2009)
Audio-recorded interviews with teachers	9 (= ca. 3.5 hrs)	• Coded for factors influencing learner motivation and achievement
Completed observation sheets	14 lessons = ca. 40 written pages	• Descriptions analyzed to produce list of characteristics of school English lessons (Lamb, 2007a) • Notes on individual learner behavior matched against other data on same individual
Learner journals	7 partially completed	• Uses of English counted and matched against interview data • Individual records matched against other data on same individual
Field notes	1 booklet	• Used mainly to provide contextual information

eight English teachers in the school, and field notes were made during the several weeks spent in the school staff room and playground. Table 1 lists the data collected.

As the project was implemented, the different instruments “cross-fertilized” each other (Dörnyei, 2007); that is, information gleaned from one source helped me refine the instruments used in later stages of the research. For example, the questionnaire data enabled me to select my focal learners in a principled way: Eight were identified as “highly motivated” and four as “less motivated” on the basis of their questionnaire responses. Another example of cross-fertilization is the way focal learners’ questionnaire responses to particular items could be used as prompts in the first round of interviews (e.g., “I notice you are not at all satisfied with your progress in English so far; why is that?”), while the classroom observations of individual learners also fed into subsequent interviews (e.g. “Why do you choose to sit at the back of the class?”). Information gained during interviews 1 and 2 helped me make modifications to the second questionnaire, such as adding an item about IT-related use of English which had emerged as a theme in discussions.

But the main purpose of blending methods is to gain a deeper understanding of the phenomenon under consideration. In Lamb (2007b, pp. 761–2) I explained my rationale in the following pragmatic terms:

Using questionnaires with the year cohort allowed testing for specific motivational constructs which I could predict to be relevant on the basis of existing theory and my own prior experience of the context. Open questionnaire items and semi-structured interviews with the “focal learners” enabled me to identify and follow up issues and concepts which I had not anticipated in the survey, but which were clearly salient in this particular context. Meanwhile, meeting learners regularly (including once outside of school) and observing them in class would not only allow me to develop a more trusting relationship with the learners but also ultimately to develop richer and more complex portraits of individuals.

Generating Insights Through Mixing Data Types: Two Examples

In this section I describe two specific ways in which I used different data sources to address aspects of my research questions.

Pupils’ Attitudes to Their Experience of Learning English

I had several sources of information on this. There were the responses to the closed questionnaire items at the beginning and end of the research period, as well as the open items asking pupils to give reasons for their response, both recorded in an Excel file. There were also the interviews with the 12 focal learners and my classroom observation notes.

In August 2002, after just a month of formal study in JHS, students’ mean response to the item “How do you feel about your school English lessons?” was very high (2.83 on a scale of 1–3); in March 2004, after a further 19 months of study, the mean response was still high but had fallen (to 2.47). In order to find out whether this difference was statistically significant, I imported the Excel data file into the statistics software SPSS and carried out a paired-samples *t* test, as illustrated in Figure 1; it proved to be so ($t = 7.77$; $p = 0.000$). I could have run a *t* test using Excel, but that program only returns the significance level, not the actual *t* value. Cohen’s *d* was also calculated and the effect size was found to be on the border of medium/large (–0.74).

I then looked to the qualitative data to find explanations for this fall in satisfaction levels. In general the pupils eagerly took up the opportunity to write reasons for their responses in the open questionnaire items. After each administration of the questionnaire,

4 LANGUAGE LEARNING AND TEACHING: MIXED METHODS

Figure 1 Screenshot of data set used with paired-samples t test, in SPSS

Figure 2 Students' reasons for satisfaction, in Excel file

Table 2 Reasons given for response to the item “How do you feel about your school English lessons?”

	<i>August 02</i> (<i>n</i> = 211)	<i>March 04</i> (<i>n</i> = 190)
Pupils who like learning English (response = 3)	54% English is valuable or important 23% Satisfaction with process of learning 13% Feeling of gaining mastery 3% Like the teacher 7% Other (226 comments: 82.6%)	30% Lessons are enjoyable 21% Lessons are easy to understand 19% Like the teacher 15% Feeling of gaining mastery 9% English is valuable or important 6% Other (138 comments: 49.7%)
Pupils who think it's OK or dislike it (response = 2 or 1)	25% English is no different from other subjects 25% English is difficult 19% English is just OK 12% English is not important in Indonesia 10% English is not enjoyable 9% Other (32 comments: 17.4%)	29% Lessons are boring or lack variety 18% Lessons are difficult to understand 16% English is no different from other subjects 16% Making little progress 12% I don't like the teacher 9% Other (95 comments: 50.3%)

I entered all the responses into an Excel spreadsheet (in both the students' L1 and English), printed them out, and then identified all the separate comments made (i.e., several pupils gave more than one reason for their numerical response). This is illustrated by a portion of the data set in Figure 2.

These comments were then categorized and re-categorized over repeated readings, and the final categories were calculated as a percentage of the whole and entered into Table 2 (Lamb, 2007a; note that the sample 'n' includes all respondents at each administration who had made a comment, not just those who had completed both questionnaires).

The “quantitizing” of the qualitative data in this way helped me interpret the significant drop in respondents' satisfaction levels with their school English lessons. Comments in August 2002 indicate that the students were still thinking of English in terms of its possible value to their future lives. After nearly two years of study at school, the March 2004 results show that they were thinking predominantly in terms of the learning process—either the pleasures to be obtained therein, or the difficulties that it presented. In other words, it was not simply that their opinion of the lessons had worsened but that the *way* they thought about them had changed. Interview data added further detail to the picture. For example, it was apparent that complaints about school English lessons were not confined to the weaker pupils or those with low motivation; in fact some of my focal learners with the highest motivation to succeed in English had the most damning comments to make about the teaching methods, because they were the ones who suffered the greatest frustration.

The Significance of Pupils' Socioeconomic Background

In August 2002 I interviewed all eight English teachers in the JHS and one from a school on the outskirts of the town, using an interview guide which consisted of prompts related to these main issues:

- background information about teaching experience, in this school and previously;
- views on the general progress of learners in English in this school;
- the characteristics of successful/less successful learners;
- the challenges they faced as a teacher in this school;
- explanation about my planned research of learners, and request for suggestions.

As I listened to the interview recordings I made detailed English-language notes in a Word document, then printed them out and made an initial coding of the main themes emerging in the data, using highlighter pens and manual notes. I then listened again to the recordings, transcribing more fully those sections which represented the main themes and identifying subthemes within them. (This was my preferred way of working at the time; nowadays I would prepare a full transcription and use qualitative data software to assist in the analysis.)

One prominent and unexpected theme was the socioeconomic background of pupils, and its relationship to their chances of success in English; this was discussed by seven of the nine teachers interviewed. Other subthemes included

- variable quality of local school provision,
- financial capacity to take private courses in English,
- support from other family members and friends, and
- availability of IT to access English.

Taking a constructionist stance toward the interview data (Silverman, 2001), I knew that teachers might have their own motives for stressing the importance of pupil background in their conversations with me—for one thing, it might absolve them from responsibility for pupils' low achievement. However, I was able to cross-check the validity of their views by carrying out statistical tests on the biographical data obtained in the questionnaire. For example, independent sample *t* tests showed that pupils from families where some English was spoken were significantly more likely to rate English as very important ($p < 0.005$), to be confident of ultimate success ($p < 0.005$), and to do more activities with English outside school ($p < 0.05$). Taking private English courses outside of school was another variable found to be significantly related to positive aspects of motivation. These findings informed my analysis of the learner interview data—for instance, I deliberately looked through the learner interview transcripts for mentions of family members—and helped me in turn to build portraits of individual learners. Because I was able to triangulate data in this way, I was able to assert the importance of pupil socioeconomic background more confidently and to argue more persuasively for further research into its connection with motivation to learn English.

Conclusion

Using mixed methods in a relatively small-scale single-researcher study such as the one described here inevitably brings special challenges. First, there is the need to become competent in the design of different kinds of research instruments and in the analysis of different kinds of data. Second, such studies are vulnerable to several points of attack on their trustworthiness. Leaving aside (as most researchers now do) the issue of having a consistent philosophical stance, both quantitative and qualitative aspects of small-scale mixed methods studies may struggle to meet quality criteria in themselves. In my study, for example, the survey was necessarily limited in scope, in terms of both sample size and the way constructs were measured by single rather than multiple items. Much of the

warrant for the credibility of such studies therefore must derive from the *combining* of data sources and careful documentation.

Language Learning and Teaching: Quantitative Methods

JOSEPH COLLENTINE AND KARINA COLLENTINE

Quantitative methods are frequently used in applied linguistics to assess the comparative quality of different approaches to language instruction. These methods can help researchers to determine objectively the effects of an intervention between different treatment conditions and over time. Task-based instruction fosters second language (L2) acquisition by involving learners in activities where they must accomplish a nonlinguistic goal. Some researchers claim that task complexity is an important predictor of the extent to which learners will make form–meaning connections, such as mapping words to their semantic denotations (e.g., Robinson, 2005). A common criterion for distinguishing simple and complex tasks is the amount and distinctiveness of referential information a task entails (Samuda & Bygate, 2008).

An Example Study

To demonstrate how quantitative methods help to explain the differential effects of task complexity on learning, the following fictitious study examines incidental vocabulary acquisition in two tasks differing in complexity. The research question is as follows: *Does task type determine the amount of incidental vocabulary students learn?* Although the researchers believe that a complex task fosters more incidental vocabulary learning than a simple task, they set up their study to test the following null hypothesis: *The amount of incidental vocabulary learned does not depend on task type.*

Method

In both tasks, beginning-level learners of Spanish first read a cartoon story about the theft of a purse. The cartoon contains the accounts of various witnesses. The complex task differs from the simple task in that its cartoon contains twice as many witnesses (and so twice as many details). Learners see mug shots of potential culprits, among which they must identify the thief without being able to return to the cartoon (for a similar task, see Duran & Ramaut, 2006).

Forty learners are randomly assigned to either the simple or complex version of the task, producing two groups of 20. A predetermined set of 12 words is seeded once into the cartoon's dialogues. The words are unlikely to be known to the learners from their curriculum. Before and after the tasks, the participants take a 20-item vocabulary test with the 12 targeted items and 8 distracters. The students are to identify the words they know and define them in their first language (L1).

Since learners are assigned to one of two groups and their vocabulary knowledge is tested before and after the instructional task, this study employs a mixed-model design. The variable *group* is a between-subjects factor since each participant receives only one type of task, either simple or complex. The variable *test* is a within-subjects, or repeated measures, factor since each participant provides two measurements of the vocabulary test: the pretest and posttest. *Group* is a nominal variable and *test* is an interval-level variable.

Figure 1 Data from Microsoft Excel imported into SPSS

In Figure 1, we see screenshots of part of the data set in both Excel and SPSS. (See the appendix for the complete data set.) The first column, headed *student*, uniquely identifies each participant. Although this column is not necessary for a repeated measures analysis, it is useful for verifying that a participant's pretest and posttest scores are correctly matched up. The second column contains a textual reference to each participant's group assignment. The third column contains corresponding pretest scores, and the fourth column posttest scores.

To answer the research question, we use both descriptive and inferential statistics. Descriptive statistics such as mean and standard deviation provide basic quantitative summaries of groups. Inferential statistics extrapolate from a sample the likelihood that its quantitative characteristics can be generalized to whole populations. Theoretically speaking, when two or more groups' quantitative characteristics are determined to be significantly different, an inferential statistic has indicated that the groups represent different populations (see Bryman & Cramer, 2008). In practical terms, inferential statistics indicate whether some measurement is significantly greater than zero or whether two or more means are significantly different.

To set up the statistical test for this data set using SPSS, we select in the application's menus *Analyze > General Linear Model > Repeated Measure*. As shown in Figure 2, the initial dialogue box requires the user to define the within-subjects factor. We type *test* in the *Within-Subject Factor Name* box and 2 in the *Number of Levels* box, since there were two repeated measures (the pretest and the posttest). We then click the *Add* button followed by the *Define* button.

Next, as Figure 3 shows, in the *Repeated Measures* dialogue box *_(1)* and *_(2)* appear under the *Within-Subjects Variables* list. First we select *_(1)*. Now we select *pretest* in the left-hand list, and click the topmost right-pointing arrow  to define the #1 within-subjects variable, converting *_(1)* to *pretest(1)*. We repeat these steps to define the #2 variable,

Figure 2 SPSS repeated measures factor definition dialogue box

Figure 3 SPSS repeated measures design dialogue box

producing *posttest(2)*. Finally, we select *group* from the left-hand list and click the middle right-pointing arrow to define the between-subjects variable.

To obtain descriptive statistics we click on the *Options* button. Just as we used the arrow and check-box controls to set up Figure 3, we elect to display means for group, test, and group by test, and then check the descriptive statistics box. We click the *Continue* button to return to the *Repeated Measures* dialogue, and the *OK* button to obtain the results.

Results

The left-hand column of the results viewer shown in Figure 4 has an outline of the statistics produced by the analysis. This outline displays various important elements for this analysis, concepts that are generalizable to similar experiments. The meaning of each of these is explained below.

Figure 4 Results viewer

- *Within-Subjects Factors and Between-Subjects Factors*: This simply details the study's variables by type.
- *Descriptive Statistics*: This contains a table of the means, standard deviations, and sample size by group and test.
- *Mauchly's Test of Sphericity; Tests of Within-Subjects Effects*: A test of sphericity is similar to a test of homogeneity of variances, and is relevant only when a study has more than two within-subjects variables (e.g., posttest–pretest and delayed posttest–posttest). After calculating difference scores between each of the ordered within-subjects variables, the test measures the extent to which these *difference* variances are equal. Researchers conducting studies with a pretest–posttest–delayed posttest design must consider whether a comparison of the two difference variances supports the sphericity assumption. If not, then an adjustment to the F calculation's degrees of freedom is necessary, and one of the other tests provided (e.g., Greenhouse-Geisser) must be used to determine the significance of within-subjects main and interaction effects (see Toutenburg, 2002).
- *Tests of Within-Subjects Contrasts*: This table indicates whether there is any main effect for *test* and whether there is an interaction between *test* and *group*. The interaction term is included in this table since it entails at least one within-subject factor.
- *Tests of Between-Subjects Effects*: This table indicates whether there is a main effect for *group*.
- *Estimated Marginal Means*: These tables provide descriptive information along with measures of the standard error and means' confidence intervals. A mean is an estimate of what a group of people will score on a measurement, on average (i.e., a sample mean is an estimate of the population mean). Considering that this is only an estimate, statisticians can calculate the range within which the population mean should fall with a confidence level of 95% (or even higher). A mean of 2.2 with confidence intervals of ± 1.2 signifies that the true (i.e., population) mean is 95% likely to be between 1.0 and 3.4. If the confidence intervals for two means overlap, we cannot be confident that they are significantly different (Smithson, 2003).

Table 1 Vocabulary scores by test and group

<i>Test</i>	<i>Group</i>	<i>M</i>	<i>n</i>	<i>SD</i>	<i>95% confidence interval</i>	
					<i>Lower bound</i>	<i>Upper bound</i>
Pretest	Simple	1.40	20	1.19	.87	1.93
	Complex	1.50	20	1.15	.97	2.03
Posttest	Simple	7.90	20	1.77	7.11	8.69
	Complex	5.70	20	1.72	4.91	6.49

In what follows, important results of the SPSS output have been formatted according to APA style. Let us first consider the statistics along with plausible interpretations. Then, we will evaluate our hypothesis. See Table 1.

What do the statistical analyses show? The important descriptive statistics are the means, standard deviations, and confidence intervals. Regarding the pretest, we can state that the two groups scored relatively the same because the simple-task group's mean ($M = 1.40$; $SD = 1.19$) is virtually equal to the complex-task group's mean ($M = 1.50$; $SD = 1.15$). Additionally, a consideration of the 95% confidence intervals indicates that the scores of the two groups overlap almost completely. Concerning the posttest, both groups appeared to score higher, although the simple-task group appears to have a higher increase than the complex task group. There are two statistics that support this. First, considering that the pretest scores were basically equal, the simple-task group's score increased more because its posttest mean ($M = 7.90$; $SD = 1.77$) was higher than that of the complex-task group ($M = 5.70$; $SD = 1.72$). Second, posttest confidence intervals of the two groups do not overlap at all.

Regarding the inferential statistics (Table 2), the tests of within-subjects contrasts show that there was a significant interaction between *test* and *group*. The important indicators here are: (1) the F value of 10.14; (2) the degrees of freedom (df) of 1,38, which is a reflection and a reminder of the study's design and sample size; (3) the p -value of .003; and (4) the partial eta squared (η^2) value of .21, which is an indication of the total amount of variance that this interaction accounts for in the analysis. The results also reveal a significant main effect for *test*: $F(1,38) = 219.51$; $p = .000$; $\eta^2 = .85$. Finally, the tests of between-subjects effects show a significant main effect for *group*: $F(1,38) = 12.20$; $p = .001$; $\eta^2 = .24$.

How do we interpret these results? First, when an analysis reveals a significant interaction between variables, the main effects are usually not considered. This is due to the

Table 2 ANOVAs for within-subjects and between-subjects effects

<i>Effect</i>	<i>Source</i>	<i>SS</i>	<i>df</i>	<i>MS</i>	<i>F</i>	<i>p</i>	η^2
Within-subjects	Test	572.45	1	572.45	219.51	0.000	0.85
	Test $\times$ Group	26.45	1	26.45	10.14	0.003	0.21
	Error	99.10	38	2.61			
Between-subjects	Intercept	1361.25	1	1361.25	752.95	0.000	0.95
	Group	22.05	1	22.05	12.20	0.001	0.24
	Error	68.70	38	1.81			

Figure 5 Pretest and posttest vocabulary scores by group

interpretation of the interaction, namely, that a learner's score is dependent on both the type of task he or she participated in and on whether we are considering the pretest or the posttest. Another way of portraying this relationship is to say that the two groups realized different changes in their mean vocabulary test scores.

This finding of a significant interaction seems to be at odds with the descriptive statistics. An additional type of data display is extremely helpful in interpreting the results, giving a clearer picture of the data and helping the researcher to know what to focus on. In Figure 5 the mean scores of the simple and complex groups are plotted in a graph. As a rule of thumb, researchers consider statistically significant interactions to be practically significant if the lines cross. By looking at the plot, we see that the lines do not cross, except for maybe a very little bit at the pretest. We see that the statistically significant interaction was due to the fact that both groups were the same on the pretest, but they differed on the posttest. We see here that unlike the interaction, the main effect of task is meaningful; indeed, it is more meaningful than the statistically significant interaction effect. This is a rather unusual example, but it provides us with the insight that results must be interpreted carefully.

Conclusion

Is the research hypothesis supported? Recall that our null hypothesis was the following: *The amount of incidental vocabulary learned does not depend on task type.* Notice that to make a defensible conclusion about the research hypothesis we have to consider both the descriptive and the inferential statistics, as well as the plot of means. Since the members of the two groups scored about the same on the pretest, but significantly differently from each other on the posttest, we can confidently reject the null hypothesis. Our experiment does not corroborate the hypothesis that a complex task fosters more incidental vocabulary learning than a simple task. We found the opposite to be true.

Given that the hypothesis for this fictitious study was not supported, in our conclusions we would need to consider perspectives from the literature that hint at making claims contrary to the original hypothesis. In this instance, we would do well to consider the

research on processing load, which may suggest that learners who process relatively large amounts of information have fewer resources to dedicate to form–meaning connections when they are primarily focused on a nonlinguistic task.

Additional Considerations

When constructing tables and graphs, we must refer to the required style sheet. In the absence of clear guidelines, we utilize the APA style sheet, to which Tables 1 and 2 above adhere. Also, we should build in Excel a plot of our results by group and test, again following a designated style sheet. We need to follow stipulations relating to the use of black and white colors, keeping plots two-dimensional, and labeling axes. Figure 5 here follows the APA stipulations.

Although we limit ourselves here to the available statistics produced by the SPSS repeated measures output, we could use a variety of techniques to compare between-subjects means. See Smithson (2003) for an intriguing and readable treatment of the usefulness of confidence intervals for comparing means. Still, readers may want to consider a technique such as employing various *t* tests and adjusting the experiment-wise alpha (α) with a Bonferroni adjustment, or construct a series of Tukey or Scheffé tests that use a predetermined α adjustment depending on the number and type of comparisons needed.

Language and Education for Returnees

RYUKO KUBOTA

“Returnees” refers to individuals who return to their homeland after sojourning in another country due to displacement caused by war, conflict, natural disaster, economic migration, overseas business assignment, international marriage, child adoption, or education abroad. The length of time away from the homeland varies from a few years to more than one generation. In the latter case, homecoming can be called ancestral return, ethnic return migration, or post colonial return (Stefansson, 2004). Homecoming has been occurring globally in diverse contexts. In the case of refugee returnees, repatriation has taken place in Balkan nations (e.g., Bosnia and Herzegovina and Croatia), African nations (e.g., Burundi, Sudan, the Democratic Republic of the Congo, Angola), Afghanistan, and Iraq. Economic migrants all over the world might seek homecoming for renewed economic opportunities, to join relatives, or to retire; for other migrants, economic or legal conditions may force their return. Academic returnees are those who return to newly industrialized nations, such as China, which encourage the homecoming of scientists with advanced degrees obtained in developed countries. In other circumstances, international adoptees return to the country of their birth parents, as seen in South Korea. Homecoming does not always imply permanent (re)settlement—individuals may shuttle between countries, complicating the meaning of homeland. Within applied linguistics, returnees raise such issues as language acquisition, maintenance, and attrition; bilingualism; identity; language policies and planning; curriculum and instruction; and broader sociopolitical, ideological, and economic issues.

Homecoming involves populations that are diverse in terms of race, ethnicity, nationality, language, socioeconomic and legal status, age, and occupation as well as the social, economic, linguistic, cultural, and political terrains they traverse. Although such complexities raise many issues, research on returnees within applied linguistics is scant. Of the many countries receiving returnees, Japan provides an interesting example of diverse returnee populations: (a) returnee children of expatriates, (b) repatriates of Japanese war orphans and remaining women in China, and (c) ethnic return migrants from South America. Publications in Japanese or English on this topic belong to various disciplines, such as education, psychology, anthropology, sociology, and intercultural communication. Comparing and contrasting these three groups reveal diversity and complexity.

The Three Groups

Kikokushijo (returnee children) began to attract educational and scholarly attention in the 1960s, when overseas work assignments for Japanese employees grew (Goodman, 2003). Since the mid-1970s, the Ministry of Education has conducted an annual survey of school-aged *kikokushijo* who lived abroad consecutively for one year or longer and returned to Japan. The number peaked in 1992 with 13,777 and has been steady with a slight decline since then. Special programs to support linguistic and cultural readjustment were established in the 1970s and 1980s within designated private and public schools. Academic mobility—passing examinations to enter senior high schools and universities—was another concern. Special quotas and test accommodations have been implemented for entrance

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

DOI: 10.1002/9781405198431.wbeal0652

examinations in many public and private institutions. Middle-class parents of *kikokushijo* and employers have been advocates for these provisions.

Repatriates from China consist of Japanese war orphans (*zanryû koji*) and remaining women (*zanryû fujin*). They were dependents of Japanese agricultural colonists who were recruited from economically depressed communities in Japan from the 1930s to 1945 to work in Manchuria. After the Soviet attack in August 1945, abandoned women and children were taken into Chinese families and many eventually married Chinese citizens. From the 1958 break in Sino-Japanese cooperation until the 1972 diplomatic normalization, *zanryû koji* and *zanryû fujin* were erased from their Japanese family registry and identified as deceased. In 1981 state-funded relative-seeking visits to Japan were introduced and in 1994 the Japanese government's responsibility was legally established, which encouraged repatriation. From 1972 to 2006, more than 6,000 individuals (or more than 26,000 including immediate family members) repatriated (Efird, 2008; Ide, 2008). While these individuals receive government assistance, an estimated 100,000 second- and third-generation family members who came to Japan at their own cost do not.

Japanese-descent (*nikkei*) ethnic return migrants are mainly from Brazil and Peru. Japanese emigration to South American countries as agricultural laborers began around the turn of the 20th century. Many present-day *nikkei* in South America are highly educated and mostly belong to the middle class (Tsuda, 2003; Takenaka, 2009). Japan's booming economy in the 1980s increased demand for unskilled labor. The 1990 enactment of the revised Immigration Control Law allowed *nikkei* and their families down to the third generation to live and work legally in Japan. In 2008, more than 370,000 Brazilians and Peruvians lived in Japan.

Comparison

These three groups of returnees are defined as such because of their shared ethnicity, ancestral blood, or current or past possession of Japanese citizenship, and thus are distinguished from other groups that enter Japan to reside. They are to a varied degree marginalized with shared difficulties of fitting in culturally and linguistically despite some commonalities with the mainstream Japanese. In-betweenness is a typical descriptor of their identity, yet their identity shifts in time and space. Returnees also negotiate their identity with the images of them constructed by mainstream society, accommodating, resisting, or appropriating mainstream images. Despite these shared experiences, there are considerable differences both between and within groups.

Many repatriates and *nikkei* returnees face multigenerational challenges in Japan. Many lack proficiency in Japanese or experience downward social mobility. Repatriates are older and many receive welfare. Conversely, *kikokushijo* are younger and socioeconomically privileged. Despite media images of *kikokushijo* as being fluent in English and having lost their mother tongue, many have received academic instruction in Japanese at either full-time or weekend government-subsidized Japanese schools overseas; they are not as academically or linguistically disadvantaged as they are often thought to be (Fry, 2009). Hence, despite readjustment challenges both academic and cultural (Kanno, 2003), most *kikokushijo* advance their academic and professional goals. A distinctive characteristic of *kikokushijo* is the way in which the political discourse of internationalization influenced a shift in the perception of them as a group to be remediated and rescued to a new international elite capable of logical thinking and creativity (Goodman, 2003).

Repatriate and *nikkei* populations also differ considerably—although the need to learn Japanese is vital for repatriates to seek employment, it is not as important for *nikkei* adults

for several reasons: (a) a portion of the *nikkei* population have maintained Japanese-language skills through attending ethnic schools or speaking Japanese at home, whereas repatriates, whose Japanese identity had been concealed due to hostility, had no such opportunity; (b) many *nikkei* returnees are hired by labor broker firms and dispatched to work in groups with bilingual speakers; and (c) stronger social networks exist for *nikkei*, who tend to live in clusters in industrial towns.

These two groups also receive different amounts of government-supported language training, although the assistance is equally insufficient. Repatriates may receive up to 12 months of Japanese-language training at government-sponsored centers. Such instruction, however, does not cater to multilevel proficiencies and resettlement pressure often diverts repatriates' efforts from language learning. As for *nikkei* returnees, the 2008 global financial crisis finally prompted the government to support language training for unemployed foreign workers. However, the government's decades-long laissez-faire policy—epitomized by the absence of teacher training and heavy reliance on volunteerism—could negatively affect this endeavor (Ortloff & Frey, 2007).

The situation of school-aged children of both groups is similar; they tend to have very little proficiency in Japanese and often need Japanese as a second language (JSL) instruction. These children mostly receive pullout instruction for basic reading and writing (Kanno, 2008), but the quality of instruction is often questionable, mainly because no teacher licensure for JSL exists, restricting teacher training. Without academic language skills that support content area learning, it is difficult to obtain an advanced education. Even though the aforementioned entrance examination quotas and accommodations are available for both *kikokushijo* and foreign children, academic and economic limitations keep the foreign children from obtaining further education. Moreover, because it is not legally required, some non-Japanese children do not attend school at all.

Each of the three groups also displays within-group diversity. For instance, *nikkei* Brazilians and Peruvians differ in that Brazilians tend to be more proficient in Japanese, mainly due to historical factors that facilitated mother-tongue maintenance—emigration to Brazil lasted until the 1970s whereas that to Peru was banned after the 1941 Pearl Harbor attack (Takenaka, 2009). Overall, *nikkei* Brazilians are socially, economically, and linguistically positioned higher than *nikkei* Peruvians in Japan. Such a hierarchy derives from the socioeconomic status of the nation which they returned from (Tsuda, 2003), which is also linked to a linguistic hierarchy in international communication.

Future Directions

The example of Japan demonstrates that, despite their shared ethnic ties, returnee groups encompass diversity: They are hierarchically positioned due to economic, political, cultural, and linguistic relations of power among nations, ethnic groups, and other categories, influencing language learning and identity formation. The impermanent nature of homecoming is observed among *nikkei* migrants who returned to Latin America after the 2008 global financial crisis, which creates further educational challenges for children without proficiency in the language of their new homeland. Increased scholarly attention to issues of homecoming would contribute to the well-being of this diverse and often disenfranchised diasporic population.

Language Socialization in Study Abroad

CELESTE KINGINGER

In research on study abroad, findings on the outcomes of student sojourns have revealed significant variation in individual achievement. These findings have also suggested that language learning in study abroad is fundamentally different from learning in classroom or domestic immersion contexts, offering considerable opportunities to learn not only linguistic forms but also their social and pragmatic meanings for expert speakers. Why do some students prosper while others do not? What are the precise qualities of study abroad experiences as they relate to language learning? Meanwhile, the “social turn in second language acquisition” (Block, 2003) brought with it enhanced awareness of the cultural, political, and identity-related aspects of language development. Study abroad researchers have accompanied the profession in its social turn, focusing not only upon the specific qualities of the study abroad experience but also upon broader questions about the socio-cultural, political, and identity-related meaning of study abroad for particular students and groups of students.

The studies reviewed in this entry emerge from a variety of methodological traditions, but all may be interpreted from the perspective of language socialization. Language socialization research examines the transformation by which novice participants learn to use language and, in this process, are socialized through language into the practices of communities as well as the local meaning of these practices (Ochs, 2002). This approach raises questions about how students are received into local communities of practice abroad and what kinds of legitimacy they will claim as participants within these communities. Ideally, students abroad are accepted as “legitimate peripheral participants” (Lave & Wenger, 1991), that is, they are granted access to observation, followed by increasingly active engagement in the everyday activities of the group.

Research on study abroad documents a variety of scenarios in which students are and are not received as legitimate participants, and in which students do and do not claim this status. This research includes a variety of qualitative and ethnographic studies of student sojourners’ experiences abroad along with case studies of individual students and in-depth portrayals of specific interactive settings. This entry first reviews studies highlighting communicative settings common to many participants in study abroad programs, the homestay, and the classroom. Subsequently, the entry examines case studies attempting to clarify the general extent to which students abroad learn languages through active engagement in local communities. Finally, the limitations of this research are outlined.

Contexts for Language Learning: The Homestay and the Classroom

Discussions of language learning in study abroad often posit a “homestay advantage” wherein students who opt or are obliged to live with local families enjoy closer ties to their host community along with richer opportunities for language development than do their peers in dormitories or apartments. Yet, the findings of some quantitative research

show that this advantage may not always be easy to prove. Rivers (1998), for example, compared multiple test scores of US-based students studying in Russia before and after the fall of the Soviet Union, when homestay became a viable option. Rivers's results showed that homestay was a negative predictor for gains in speaking ability, had no effect on listening, and was a positive predictor for reading. Thus, in many cases, the homestay did not foster social interactive abilities. For a candidate explanation, Rivers turned to ethnographic data portraying the homestay as involving banal, quotidian dialogue and television watching, with students spending the majority of their time alone, doing homework.

Wilkinson (2002) studied the recorded interactions of four US-based students with members of their host families in France. The students' prior language socialization had taken place entirely in classroom settings, and they exhibited a marked tendency to employ discourse strategies, such as the infamous IRE (initiation–response–evaluation) structure, in their informal conversations. "Ashley," for example, recruited a host brother, Girard, to help her satisfy the requirements of the project, asking him a series of semantically hollow and unmotivated questions that appeared to be more geared to demonstrating her own competence than to expressing interest in Girard. The unfortunate consequence of these interactions was that the American students tended to interpret their hosts as uncooperative or condescending, and therefore to limit further participation in family encounters.

More fruitful, if still complex, were the interactions between Anglophone students and their Japanese hosts documented in Siegal (1996), Cook (2006), and Iino (2006). In a longitudinal study of Anglophone women in Japan, Siegal (1996) identified the significance of a "gaijin" (foreigner) identity assigned to her participants and limiting their access to Japanese, in particular to the honorific forms required to develop a full expressive repertoire. Iino (2006) and Cook (2006) demonstrated how this identity emerges in the context of the homestay, examining the nature of dinner table conversations between students and their host families. Iino identified a continuum of approaches adopted by families with respect to their guests. On one end of the continuum is the "cultural dependency" approach, wherein the student guests were construed as fundamentally helpless and in need of massive assistance for managing everyday life in Japan. In its extreme form, this approach yielded a situation in which the student guest was treated as an exotic family "pet" (p. 162). On the other end is the "two-way enrichment" ideal where the families saw the homestay arrangement as a learning opportunity for themselves. In these situations, the family dinner hour became a locus for intercultural exchange. Cook's (2006) study further illustrates the "two-way enrichment" process with a focus on the sharing, and challenging, of folk beliefs around the family dinner table.

Two recent studies suggest that the host family dinner table can play a key role in the language socialization process for students abroad. Cook (2008) examined how Japanese host families express their identity through the use of the "addressee honorific" *masu* form and how their guests are socialized through its use. Through both implicit modeling and explicit instruction, the families were shown to guide students toward the ability to shift from plain to honorific styles in ways appropriate for "in-group" talk. Thus, at least in one communicative domain, this study provides evidence that the "gaijin" identity does not necessarily interfere with the learning of diverse styles in Japanese. DuFon's (2006) study of the socialization of taste in Indonesia illustrates the intimate links between learning to eat and learning to talk. The participants in this study were explicitly oriented to their food in formats very like language lessons. As they learned to eat, they also learned about local values and culinary aesthetics.

Taken together, these studies suggest that the homestay can become a crucible for language and culture learning in cases where the dispositions of all concerned parties are aligned for this purpose. The "homestay advantage" is not, however, guaranteed. When

students are not granted the status of “legitimate peripheral participant,” or when they do not claim it, no such advantage is in evidence.

The same principle applies to the more limited research on classroom learning in study abroad. Churchill (2006), for example, compared the achievements of Japanese secondary-level students in two US high schools. One group, in an elite private school, was given an organized and warm reception along with clear roles and opportunities to display expertise. The other, in a large suburban public high school, was barely acknowledged, but occasionally viewed as a disruptive inconvenience. The ways in which the participation of these students was interpreted by their respective institutions had a marked effect on their desire and ability to speak English, with the students at the elite school outperforming their counterparts in the public school.

Within other qualitative studies, there are indications that students confronted with unfamiliar norms of classroom interaction or literacy practices may reject those practices, at least at first. For example, Rebecca, one of the participants in Pellegrino Aveni’s (2005) study, reacted in anger to the direct criticism issued by her Russian teacher. Without calling into question whether or not such acts were normative for the Russian classroom, Rebecca blamed the teacher for her own negative attitude and failure to progress in learning Russian. Patron (2007) followed a group of French students through and beyond their year-long sojourn in Australia. These students were initially unnerved by the low-key, egalitarian nature of teacher–student interactions, and mystified by the concepts of plagiarism and research citation. By the end of the year, however, they had accepted all these features of Australian academic life.

The qualities of the homestay or classroom contexts for language learning are thus somewhat difficult to predict, as they depend upon a complex interplay of student and host stances. When students are granted the status of “legitimate peripheral participant,” when they are mindful of this role and willing to expand their participation, opportunities for language learning emerge. It is also possible, however, that hosts may not grant legitimacy to the study abroad participant, or that students themselves may turn away from language learning opportunities following cultural misunderstandings or expectations based on their previous socialization in classrooms.

Case Studies of Groups and Individuals

Another approach to investigating the qualities of study abroad for language learning is the case study. Levin (2001), for example, carried out an ethnographic study of a cohort of American undergraduates in France. Levin found that language learning was explicitly downplayed by the program staff. Most students systematically avoided opportunities for language learning, living together, and shopping for peanut butter and salsa at big box stores rather than facing unfamiliar foods and challenging interactions in the university cafeteria. Three additional, recent case studies of students abroad offer further insight about how students are received and how they orient to their experiences.

Isabelli-García (2006) followed four American undergraduates through their sojourn in Argentina. The results of proficiency tests were evaluated against accounts of attitude and motivation as observed in learner diaries, and the nature and extension of each student’s social network. The student with the greatest post-program proficiency gain, “Stan,” spoke Spanish at home, overcame ethnocentrism, and developed a broad network of Argentine friends who included him in their social plans. “Jennifer,” the only woman among the participants, made no measurable gains in proficiency. Jennifer had difficulty finding and settling in with an acceptable host family, and spent most of her free time with another American woman. Moreover, she quickly became alienated from Argentine society in general as she observed unfamiliar gendered practices such as the “ugly” *piropo* (Twombly,

1995) or catcalling in the street. Isabelli-García's study thus contributes to the argument that gendered identity exerts influence not only on attitude and motivation but also on opportunities to participate in activities related to language socialization.

Kinginger's (2008) study also involved a cohort of American undergraduate students in France. Adopting theoretical framework from sociocultural theory, Kinginger examined the qualities of the experience, its outcome in terms of academic and basic interpersonal language ability (Cummins, 1979), and the ways in which the students interpreted their sojourns through familiar cultural and narrative resources. In both a standard measure of grammatical competence and the language awareness interview designed to assess knowledge and use of sociopragmatic variants, the 23 students in the cohort exhibited considerable variation in achievement outcome. In focusing on the individual cases of six students, Kinginger attempted to trace the origins of these differences in terms of the students' personal dispositions and stances and in terms of the overall nature of the experience.

Students with low achievement profiles in Kinginger's study were all shown to limit their own access to language socialization, but for various reasons. "Beatrice" interpreted interactions with her host family through the lens of American collective memories about France, that is, she was angry that her hosts failed to honor her country's heroic role in World War II, and she heard their questions about American foreign policy as assaults on her patriotism. As a result she became alienated from her only source of informal language learning. "Ailis" appeared to have forgotten some of what she knew of French after a semester devoted to a Grand Tour of monuments and Hard Rock Cafés. "Deirdre" literally screened herself from interaction with local people, spending all of her free time in online interactions with friends and family at home. Deirdre adopted a consumerist interpretation of study abroad and devoted considerable effort to complaints about the service she was receiving.

Kinginger's study also illustrates how students may take productive advantage of the homestay, and may further their language ability through participation in a variety of settings. "Liza," for example, developed a close relationship with her host mother, and was included in numerous social events within the family circle. One of the students who made the most impressive gains in all domains was "Bill," an outgoing young man whose proficiency in French was extremely limited prior to his sojourn abroad. Bill was also received by a family patiently shepherding him through dinner hour conversations; he worked as an intern and joined several campus associations and interest groups with the explicit goal of expanding his linguistic repertoire. "Louis," who presented the highest score ever recorded on the standard test used in the study, excelled in the classroom and became a prized partner for group assignments. He also expanded his social circle, as well as his knowledge and use of informal registers, through volunteer work at a soup kitchen. Thus, Kinginger's case studies suggest that the qualities of study abroad experiences are quite diverse and that language learning in study abroad depends on a complex interplay of student and host dispositions and interpretations of this activity.

In her ethnographic study of students from Hong Kong on a short-term sojourn in Britain, Jackson (2008) artfully combined the community of practice perspective with Ting-Toomey's (2005) poststructuralist identity negotiation theory. On this view, hosts and students share responsibility for successful intercultural communication. In the process of intercultural adjustment and identity change,

newcomers who find their host environment welcoming and supportive are likely to develop more positive attitudes toward the host culture (and language) and, as a consequence, make more of a concerted effort to become "full-fledged" members. By contrast, those who find the journey too daunting may retreat, reducing opportunities for personal and linguistic expansion. (Ting-Toomey, 2005, p. 52)

Jackson's case studies of individual students again illustrate contrasts in the extent to which students and their hosts may contribute to successful language socialization. "Ada," for example, struggled through the better part of her stay with her own disillusionment, ethnocentrism, and hostility toward British cultural practices. She tended to interpret others' curiosity about her as racism, and to worry excessively about her own well-being. Her interactions with her host family, in particular when they repeatedly mislabeled her as Japanese, only heightened her awareness of her own history and identity. "Niki," on the other hand, actively cultivated an ethnorelative mindset and hoped to acquire an international persona. Although Niki also struggled with perceptions of racism, she found the members of her host family "gracious and respectful" (Jackson, 2008, p. 192) and spent a great deal of time developing a close reciprocal relationship with them. In the end, Niki developed both her social discourse skills and her perception of English as a living language rather than a mere utilitarian tool. In bringing to the fore the process of identity negotiation, Jackson's study offers new insights on the process of language socialization in study abroad contexts.

Interpreted through the lens of language socialization, case studies illustrate a range of ways in which language learners abroad either succeed or fail to negotiate access to learning opportunities. In many cases, students who go abroad are novices within the communities they join, and tend to apply cultural tools and narrative templates derived from their own sociocultural history to the interpretation of local cultural practices. Much depends on the individual's motives for study abroad: Niki's aspirations toward a multicultural identity helped her to bypass obstacles and take full advantage of her homestay, while Ailis's approach to study abroad as tourism severely curtailed her interaction with local members of the host community.

Limitations and Conclusion

The most obvious limitation of the research on study abroad in general is the overrepresentation of students from the United States. In this review, only two studies (Patron, 2007, and Jackson, 2008) involve students from countries other than the United States. As Kinginger (2009) argues, a focus on language learning in study abroad may well reflect the fact that American learners typically do not present high levels of additional language ability when they go abroad. In Europe, by contrast, most participants in programs of residence abroad already have extensive experience of the host country along with functional language ability (Coleman, 1997). Although there may be features that all educational sojourns share, until there is a broader representation of sending and receiving countries, generalizations based on this research will be risky.

A major limitation of the qualitative research is its nearly exclusive emphasis on student perspectives. Students, and particularly the majority of American students populating the research base, are by definition relatively unaware of the cultural practices of their host communities, and rely on home-based cultural resources to interpret these practices. Thus, a common outcome of the research is the impression that the educational and other socio-cultural activities of the wider world are bizarre or inexplicable. There is a great need for the findings of this research to be interpreted in intercultural perspective, and for the research itself to include the point of view of host teachers, families, and program administrators who might help to unearth the sources of misunderstanding.

The social turn in study abroad research has yielded significant insight, helping to flesh out the findings of quantitative studies with stories of real people who succeed and who fail to learn languages. Clearly, the study abroad experience is so variable that it cannot be readily reduced to the status of an experimental treatment. Yet, this research is as still

quite limited in scope and sophistication, requiring both broader representation on an international scale, and truly intercultural interpretation of findings.

Language Testing and Accountability

LORENA LLOSA

Language assessments are typically used to make decisions about individuals and programs. These decisions affect a number of stakeholders directly or indirectly. Stakeholders may include students or test takers, teachers, administrators, parents, employers, and schools. Because language tests and their uses affect stakeholders in important ways, language test developers and language test users are accountable to them. According to Bachman and Palmer (2010), “being accountable, or accountability, means being able to demonstrate to stakeholders that the intended uses of our assessment are justified” (p. 92). The need for accountability to stakeholders, test takers in particular, is the driving force for most of the validity research conducted today. Messick’s (1989) redefinition of validity as including value implications and social consequences drew attention to the importance of accountability toward the test taker as well as other stakeholders. Norton (1997) viewed “the recognition that language assessment practices should be accountable to test takers” as part of a “broader trend towards democratization of educational assessment in general” (p. 313).

In addition to accountability to test takers, accountability to systems has recently dominated the discussion in language testing and educational assessment. Educational accountability systems typically involve efforts to assess and rate schools and districts based on student performance and, in some cases, to provide rewards and sanctions based on performance or improvement over time. Language tests play an increasingly important role in these systems given that the student population in many countries is composed of large numbers of second language learners. This is certainly the case in many English-speaking countries. In 2005, for example, English-language learners constituted 10% of the school population in the USA; in Canada they accounted for 20–50% of the population in urban school systems (Fairbairn & Fox, 2009), and in England, they constituted 9–11% of the school population (Leung & Lewkowicz, 2008). Educational accountability takes on a different form in different countries and at different times. In the USA, for example, accountability is currently characterized by the use of high-stakes, large-scale standardized tests. In Canada, most provinces have implemented government-mandated testing in core curricular areas, and test scores can account for up to 50% of a student’s grade at graduation (Fairbairn & Fox, 2009, p. 12). In the United Kingdom and Australia, teacher assessments are an important part of accountability systems.

The Role of High-Stakes, Standardized Tests in Accountability Systems

Language assessment is a key component of the accountability system in the USA. No Child Left Behind (NCLB, 2001) requires that states, districts, and schools monitor the number and percentage of English-language learners (ELLs) who make adequate yearly progress in their language proficiency. English-language proficiency tests are therefore needed to meet the federal mandate. These tests are used for three main purposes: identifying students as English-language learners, monitoring their English-language development, and reclassifying them as English-language proficient. The law also requires that all

2 LANGUAGE TESTING AND ACCOUNTABILITY

students, including English-language learners, be tested in the content areas of language arts, math, and science. Each state has developed a set of content standards in these areas as well as assessments intended to measure mastery of these standards. The goal of this standards-based system is for all students to make adequate yearly progress and attain proficiency. Failure to attain these goals can lead to severe sanctions, including school closings.

The Language Assessments

Given the high stakes involved, it is critical that English-language learners' proficiency be accurately assessed. However, the language tests that had been developed prior to NCLB were found lacking for the purpose of accurately measuring students' academic language proficiency. Most of these tests assessed social language proficiency as opposed to proficiency in the types of academic language needed to succeed in school. Furthermore, as Abedi (2007) points out, "pre-NCLB assessments were not based on an operationally defined concept of English proficiency, had limited academic content coverage, were not consistent with states' content standards, and had psychometric flaws" (p. 121). Work had to be carried out to define and operationalize the construct of academic language proficiency by investigating empirically the kinds of English required of K-12 English-language learners (Bailey & Butler, 2003). This investigation called attention to the inadequacy of existing research on the development of the academic English-language skills that all students—both English-language learner and native English speaking—need to be successful in schools (Bailey, 2007).

In response to the NCLB mandate, states, test publishers, and consortia of states engaged in efforts to develop new English-language proficiency tests. These new tests are standards-based, emphasize academic English, are aligned with academic content standards, include assessment of oral language, are designed to be comparable across grades, and allow for more than one proficiency level within a grade span (Abedi, 2007). Examples of these assessments include the *Assessing Comprehension and Communication in English State-to-State for English-Language Learners (ACCESS for ELLs)* developed by the World-Class Instructional Design and Assessment (WIDA) Consortium, the *Comprehensive English Language Learning Assessment (CELLA)* developed by five states with Educational Testing Service and Accountability Works, and the *English Language Development Assessment (ELDA)* developed by the Council of Chief State School Officers (CCSSO), along with states in the State Collaborative on Assessment and Standards for Limited English Proficient students (LEP-SCASS). (See Abedi, 2007 for a more detailed description of these assessments.)

Because these assessments are relatively new, little research has been conducted that examines their qualities and assesses whether they accurately measure students' academic language proficiency (e.g., Albers, Kenyon, & Boals, 2009). Future research should investigate the extent to which these assessments provide useful information for the purposes of accountability.

The Content Area Assessments

NCLB requires that English-language learners be tested not only in terms of their language proficiency but also in language arts, math, and science. Abedi (2004) argues that assessments of content knowledge are linguistically and culturally inappropriate. He claims that assessing English-language learners in a language in which they are not yet proficient results in construct-irrelevant variance and that the resulting scores are not meaningful indicators of students' content area knowledge. Accommodations were introduced as a way to provide English-language learners an opportunity to demonstrate what they know and can do. Accommodations are modifications made to the test itself or to the testing

procedure that allow English-language learners to access the test without changing the construct and without giving them an advantage over students who do not receive the accommodation. Examples of accommodations include providing test takers with a translated test, a test written in simplified English, dictionaries or glossaries, and allowing for extended time during test administration. Research on the effectiveness of accommodations so far has yielded mixed results. According to Kopriva, Emick, Hipolito-Delgado, and Cameron (2007), the different findings may be due to a one-size-fits-all approach to administering accommodations that does not take into account the various characteristics of different groups of English-language learners. For example, translated tests are only effective accommodations for English-language learners who are literate in their L1 and who have received content area instruction in their L1. Kieffer, Lesaux, Rivera, and Francis's (2009) meta-analysis on the effectiveness and validity of accommodations for English-language learners found that only one accommodation—providing English dictionaries or glossaries—had a statistically significant effect on English-language learners performance. They concluded that accommodations are not particularly effective in reducing the impact of limited language proficiency on the assessment of content knowledge.

Although more research on the validity and effectiveness of various accommodations for different subgroups of English-language learners is needed, many argue that the more promising solution to meaningfully assessing English-language learners' content knowledge and including them in the accountability system is to consider the English-language learner population at the test development stage (Solano-Flores & Trumbull, 2003; Abedi, 2004; Fairbairn & Fox, 2009). Fairbairn and Fox (2009) propose a number of approaches for test development that take into account the unique linguistic and cultural characteristics of English-language learners. Keiffer et al. (2009), on the other hand, suggest that the solution lies in developing a better understanding of the link between academic language proficiency and content area knowledge, and in providing English-language learners with "targeted, explicit, and intensive instruction in the complex and specialized language that lies at the heart of each content area" (p. 1190).

The Role of Classroom Assessment in Accountability Systems

Unlike the USA, where accountability is driven almost exclusively by large-scale, standardized tests, in England and Australia teacher assessment plays a prominent role. McKay and Brindley (2007) explain that in the 1970s and 1980s ESL (English as a second language) teachers in Australia were provided with extensive professional development opportunities for improving classroom assessment practices due to the belief that "the classroom teacher was the key decision maker in the curriculum" (p. 69). Australia experienced a policy shift in the early 1990s with the adoption of standards-based educational reforms. The National Literacy Benchmarks were developed and external standardized testing was adopted in primary schools across the country. In an effort to raise standards, the federal government used student achievement information to monitor student, school, and state-level performance, to compare the performance of the states and territories, and to award incentives and impose sanctions (McKay & Brindley, 2007). Like NCLB in the USA, this reform involved the assessment of ESL students using external standardized tests based on mother-tongue literacy benchmarks. These reforms have had an impact on classroom assessment practices. A large national study that examined how ESL teachers interpreted and used assessment frameworks revealed that most teachers adopted these frameworks, but also adapted them according to their needs and their personal preferences, which resulted in an inconsistent implementation (Breen et al., 1997). Teachers were often torn between the "managerial and educational purposes of standards" (McKay & Brindley, 2007, p. 77). Also, the external standardized tests, which are linguistically and culturally inappropriate

for ESL students, have resulted in increased pressure and stress for teachers and their students (McKay & Brindley, 2007).

In the late 1990s, England adopted a new policy to address the perceived low levels of achievement in English and English literacy (Leung & Rea-Dickins, 2007). Leung and Rea-Dickins (2007) explain that the policy required that by 2002, 80% of 11-year-olds should reach the standards expected for their age in English (Level 4 or above on the National Curriculum English attainment scales). Student achievement was to be measured using both standardized tests and teacher assessment. Initially, only the standardized test scores were used for public reporting, but recently teacher assessment took on a more prominent role. Teachers of English as an additional language (EAL), who have to assess their students' progress in English as well as their attainment in English and the subject areas, have been uniquely affected by this reform. Leung and Rea-Dickins's (2007) examination of official policy documents on teacher assessment revealed an emphasis on summative assessment of students' performance, and not on the type of formative assessment that has been shown to be effective: classroom assessment embedded within interaction that involves learner agency. The language of these documents also privileges a narrow view of language proficiency that focuses on its morphosyntactic characteristics. This is particularly problematic given that EAL students need to be able to use language across the curriculum. Finally, these documents do not acknowledge the distinctive developmental trajectories of EAL students. Teachers in this system find themselves in the role of "raters," using assessment to certify students' performance against a set of standards, as opposed to using it to support students' language development. Leung and Rea-Dickins (2007) thus argue that despite the prominent role given to teacher assessment in the accountability system, these assessments have become instruments simply to serve the system, not to help students and their teachers.

Assessment and Accountability: Accountability to Whom or What?

As Fairbairn and Fox (2009) point out, despite the problems inherent in the language and content assessments used to assess second language learners, scores obtained from such assessments are rarely scrutinized when they are used for accountability purposes. Leung and Rea Dickins (2007) also found, in the context of the United Kingdom, that policy ignores the technical and educational issues related to the assessments used. Assessment used primarily for accountability purposes can lead to a number of unintended consequences. In the USA, for example, schools that serve large numbers of English-language learners tend to be the most affected by accountability sanctions. This is in part due to English-language learners underperforming on assessments (which as discussed above may not accurately measure their abilities), but also due to other problems with the accountability system. One example is the "moving target" nature of the English-language learner group (Abedi, 2004). As English-language learners become proficient in English and reclassify, they exit the group. At the same time, students that are not proficient enter the group on an ongoing basis. As a result the group as a whole cannot make progress. The law now allows English learners who reclassify to be included in the "adequate yearly progress" calculations for two years after their reclassification, but this does not solve the problem, and schools who serve English-language learners continue to be penalized. A similar problem happens in Canada where information about numbers of English-language learners or the appropriateness of the tests used with this population is not used to explain poor performance on school report card grades (Fairbairn & Fox, 2009).

Other unintended consequences involve the effect that assessments used for accountability have on instruction and on classroom assessment practices. When high stakes are

attached to assessments, teachers tend to “teach to the test,” resulting in a narrowing of the curriculum. Also, classroom assessment often is no longer used formatively but instead it is used to summatively measure students’ performance or predict student performance on the high-stakes tests. Ironically, accountability systems intended to raise standards and improve the achievement of all students often end up undermining their own goals by not supporting the language and academic development of its ELL/ESL/EAL population.

Language test developers, language test users, and teachers are faced with the challenge of developing and using language assessments that satisfy the demands of system-wide accountability. At the same time, they must keep in mind that they are also accountable to stakeholders. Accountability to test takers, in particular, should continue to be the primary concern.

Language Testing and Immigration

NICK SAVILLE

Introduction

The outcomes of language tests have important consequences for test takers and for society more widely (see Wall, 1997, on impact and washback). This is particularly true when tests are used in the context of immigration. For this reason the decision to use language tests, either to support learning or as instruments of policy, should not be taken lightly.

Changing patterns of migration in the 1990s resulted in a significant increase in uses of language assessment for migration purposes (Van Avermaet, 2009). In response language-testing professionals expanded their test development and research concerns to engage with the social, political, and ethical dimensions of language assessment and raised questions as to whether the tests they develop are used fairly and for ethical purposes.

Increasingly language testers are drawn into public debates about the implementation of immigration and citizenship policies and academic publications directly addressing these issues have increased (e.g., Shohamy & McNamara, 2009).

The Age of Migration

Most people reside in their country of birth, learn one or more languages of their own region, and develop their own cultural identities; taking up residence in another country, voluntarily or out of necessity, is not the rule. Nevertheless the early part of the 21st century has been characterized as “the age of migration” (Castles & Miller, 2003), considered by some to be one of the defining global issues of our time.

The International Organization for Migration (IOM; www.iom.int) estimates that close to three percent of the world’s population or nearly 300 million people live outside their place of birth. The Organization for Economic Cooperation and Development (OECD) sees the effective management of migration as a high priority, and many member countries have developed procedures to regulate the flow of newcomers into their countries and to select which are allowed in or have the right to settle.

National governments tend to receive strong public support for policies which require newcomers to demonstrate knowledge of the national language in order to settle or to become citizens. A common response by policy makers has been the introduction of language requirements for those applying for entry visas, seeking long-term settlement, or applying for naturalization. Scores on language tests may be required to demonstrate proficiency at a specified level, although practices differ widely (Extra, Spotti, & Van Avermaet, 2009; Hogan-Brun, Mar-Molinero, & Stevenson, 2009).

Managing Migration

For the IOM, a migrant is understood as anyone entering a country with the intention of staying one year or more, and those who are already living in a destination country with permission to remain. This means that international students, footballers, or managers in

2 LANGUAGE TESTING AND IMMIGRATION

multinational companies can be considered migrants, as well as refugees from war zones or those seeking political asylum. For bureaucratic purposes, however, all migrants fall into two broad categories: authorized and unauthorized (or illegal) migrants.

Authorized migrants are those who follow the immigration procedures stipulated by the authorities of the destination country. They hold valid travel documents from their country of origin and are granted appropriate visas and other permissions to enter and remain in the country.

Unauthorized migrants arrive in a destination country without valid travel documents, do not go through the official channels and do not obtain the appropriate permissions to remain. These often include vulnerable groups such as refugees, asylum seekers, and victims of human trafficking arriving in their new country under duress.

Historically, war and persecution were responsible for enforced migrations resulting in refugees and asylum seekers arriving in destination countries, often as whole communities or family groups. This was the case at the end of the 19th century and at various times throughout the 20th century when the first instances of language tests for immigration purposes emerged (see below).

Reasons for contemporary migration still include asylum, but increasingly migration takes place for economic reasons: education, employment, and business opportunities provide the motivation to migrate, encouraged by demographic change and modern transportation systems which facilitate mobility in a transnational world. Many migrants no longer leave their place of birth on a one-way ticket but move between homes in different countries. Family groups sometimes arrive at different moments over an extended period and those already settled may acquire the right to bring family members to join them, especially older relatives, or intended spouses (family reunion and family formation).

In the early 20th century passports and visas were introduced to regulate the movement of people; these are now taken for granted and are familiar to all travelers crossing borders or passing through airports. For those wishing to stay longer than a few months, however, these are only one part of a complex immigration process which begins with entry into the country. In many countries, selection procedures and border controls have been significantly tightened through the introduction of advanced technology (such as biometric checks) and the use of tests as instruments of public policy (e.g., Netherlands, Denmark). These tests may be administered before the migrant leaves home. Some countries (e.g., Australia, Canada, UK) have introduced a points-based approach to select which applicants can enter the country, with language proficiency requirements, including formal language tests, being one element for which points are awarded.

With the increase in regulation has come the possibility of tougher sanctions for those who do not comply, thus raising the stakes of the procedures used. Test scores are used for making important decisions and have important consequences for migrants and their families; failure to meet specified requirements may mean that entry is denied or can result in expulsion. For migrants already living in the country, failure to pass a test may incur sanctions which affect their civil rights, such as access to the workplace, social benefits, or democratic processes.

The Role of Language Assessment

Policy makers typically use the metaphor of “the journey to citizenship” in their presentation of immigration processes, but the “stages of the journey” and the appropriate roles that language learning and language assessment can play along the way tend to be poorly understood. This is often reflected in public discourse and reporting in the media (Blackledge, 2005, 2009).

If high-quality tests are to be developed and negative impacts avoided, it is important to understand this “pathway” better. Saville (2009) identifies six stages where bureaucratic procedures are typically encountered by migrants to many countries. He suggests that by focusing on the different factors which are relevant at each of these stages, better procedures for language assessment can be developed. (He also notes, however, that these stages are for analysis purposes only, and are not intended as recommended steps to follow in developing a migration policy.)

- Stage 1 pre-entry in the country of origin, including visa applications
- Stage 2 arrival and entry in the destination country including border controls
- Stage 3 extension of stay—including renewal of visas for specified purposes
- Stage 4 long-term settlement—the granting of indefinite leave to remain
- Stage 5 application for naturalization (citizenship)
- Stage 6 granting of citizenship—issue of a new passport and availability of travel visas

At each stage various forms of language assessment may be deployed as part of the procedure.

Testing at Stages 1 and 2 is typically carried out to grant initial access to a country in keeping with laws and regulations on border control. Testing at Stages 3 to 6 is typically carried out when resident migrants apply for longer-term settlement or citizenship. A discussion of the complex sociopolitical issues which are raised in relation to integration and citizenship is beyond the scope of this entry, but this is dealt with extensively in the literature on migration (e.g., Hogan-Brun et al., 2009).

Each stage may require tests with different technical features (formats, content, level of difficulty, etc.) which enable appropriate decisions to be made using the results. In all cases, tests with weak technical characteristics (e.g., poor reliability) inevitably lead to unfair outcomes for test takers. (See Bachman & Palmer, 1996, on developing useful tests and Kunnan, 2003, on test fairness.)

In order to judge whether a test is fit for its intended purpose at each of the stages, it is important to know how and why the test results will be used, and what the consequences will be for the test takers and other stakeholder groups. It makes a difference whether the test is meant to help migrants to improve their current competence in the target language, to ascertain whether their proficiency is sufficient for participation in well-defined social situations (for study or work), or to support decisions which affect their legal rights (their right to remain in the country or acquire citizenship).

Test takers need to understand the intended purpose so that they can prepare accordingly. Other members of society should also understand this so that the results can be interpreted correctly and used fairly. For example, a settled migrant (at Stage 4) might choose to take a test at the end of a language course as a record of achievement, perhaps to move up to a higher class or as a qualification for use in the workplace. Such a test should fit with educational objectives in keeping with lifelong learning and basic skills development. If a test is not linked directly to a course of study, but is taken in the country of origin (Stage 1) to determine whether a newcomer has the language skills to study for a PhD or to practice medicine, other considerations are likely to be important; the test will need to be widely available outside the destination country and be supported by systems to prevent cheating.

The relationship between language tests and language course provision is an important consideration. In some countries formal tests are not used, but attendance on “integration courses” with a language component may be a formal requirement or an option (see Gysen, Kuijper, & Van Avermaet, 2009).

Stages 1 and 2: Pre-entry and arrival

Demonstrating language proficiency as part of the process of entering a country as a newcomer (Stages 1 and 2) is not new and language assessment of various kinds was used for this purpose throughout the 20th century (Davies, 1997a; McNamara, 2005). In some cases, language tests were used explicitly as instruments of government policy to exclude certain groups and to prevent them from entering the country (e.g., the Australian Dictation Test; Davies, 1997b).

Language assessment has also been used to verify identity claims of refugees and asylum seekers entering a country without travel documents, for instance an interview conducted in a language of their country of origin to verify their provenance and thus eligibility for asylum status (McNamara 2005; Eades, 2009).

When tests are used in these contexts, the validity of such practices has been called into doubt. Spolsky, for example, has pointed out the potential negative effects arising where language tests are used for “gatekeeping” and raised serious ethical concerns (Spolsky, 1981, 1995; see also Hamp-Lyons, 1997).

Language tests are often used to select applicants for entry to academic programs or for recruitment purposes, and a specified score on a recognized test has commonly been requested by universities and employers. Language tests designed for this purpose have existed for many years, but, whereas in the past the required proficiency level was left to the discretion of universities and employers, increasingly the level is being set by government policy as a requirement for obtaining entry visas (e.g., within a points-based system).

For English-speaking countries, tests such as the TOEFL and IELTS were developed for academic purposes with predecessors dating back to the first half of the 20th century (Spolsky, 1995; Davies, 2008). Testing systems of this kind are typically designed to meet high technical standards and are supported by well-articulated validity arguments and research evidence. Concerns are sometimes voiced, however, if the test scores are used for purposes for which the test was not originally designed.

While it is generally accepted that students and skilled workers should show evidence of language proficiency before being granted a study or work visa, until recently family members were not typically tested for family reunion or family formation. However, in many countries the authorities now stipulate language requirements for spouses seeking to join a partner already living in the destination country. The use of language tests for this purpose is particularly controversial, and again ethical concerns have been voiced; critics for instance point to inappropriate uses of language tests to reduce marriages between second- and third-generation migrants and spouses from the “home country.”

Stages 3 to 6: From Extension of Stay to Naturalization

Many migrants extend their stay for a number of years before returning home (Stage 3), but some decide to settle permanently. Eligibility for permanent residency is usually dependent on the number or years which the migrant has spent in the country. Additional requirements have been introduced in some cases, including the need to demonstrate a specified level of language proficiency prior to applying for settlement (Stage 4) or naturalization (Stage 5). Some cases have been documented in the language-testing literature (e.g., Cooke, 2009; Kunnan, 2009; McNamara, 2009).

The use of language tests, often combined with knowledge of society or “civics” tests, has become widespread but this has opened heated debates on a wider range of topics: the nature of citizenship, the role that language knowledge should play in being a citizen, language and identity, and the social dimension of assessment in general (Norton, 1995, 2000; Starkey, 2002; McNamara & Roever 2006).

Sociolinguists point out that knowledge of the national language can be used for unfair discrimination, and that language tests can be used as instruments of power to distinguish “insiders” from those who do not belong to the majority population, for instance to judge, to normalize, to quantify, to classify, or to punish (Bourdieu, 1991; Shohamy, 2001).

Some critics of citizenship testing have suggested that test features (e.g., content and level) can be deliberately manipulated to deny certain groups access to citizenship of the country they have lived in for many years or, in some cases, were born in. In such cases it is usually not possible to separate citizenship tests from the historical or sociopolitical context, as in the Baltic states after the fall of communism.

Investigating Impact

Not all commentators agree that language testing inevitably leads to negative impacts; some educationalists and test providers argue that assessment can play a positive role in helping migrants to integrate into society by supporting their learning and by recognizing their achievements. Some also argue that, if test developers and policy makers are encouraged to follow established codes of ethics and professional practice (e.g., ALTE, ILTA), suitable language tests can be chosen, constructed, and used appropriately (Saville & Van Avermaet, 2008). There needs to be informed debate which allows the different views, beliefs, and attitudes about assessment to be exchanged, and careful consideration given to the ways in which testing regimes affect people’s lives and have potentially negative consequences.

Organizations such as the Council of Europe have played a leading role in arranging symposia and other events to facilitate this kind of interaction (see www.coe.int/ for thematic papers on language and social cohesion).

Investigating impact and washback needs to be an integral part of establishing the usefulness of tests for migration and citizenship purposes; this should entail collecting relevant data and, whenever necessary, taking action to improve both the tests and the uses to which the results are put. This is a shared responsibility between test providers and test users. Assessment professionals need to collaborate with the diverse stakeholders who use their tests (the test takers, teachers, bureaucrats, politicians, etc.) to collect the relevant information (the evidence). The resulting analysis can be used to evaluate fairness of the assessment regime as a whole and to identify where improvements can be made. In this way, both the technical and the ethical issues can be addressed, allowing stakeholders to be treated more fairly.

Language Testing in Second Language Research

EMMA MARSDEN

Researchers investigating second languages (L2) use tests for many purposes and, therefore, use many different ways of defining, eliciting, measuring, and analyzing what it is to know and use a second language (for in-depth discussion see Bachman & Cohen, 1998). One of the most frequent reasons L2 researchers test language is to evaluate the effectiveness of second (including foreign) language teaching, ranging from whole teaching programs to a very brief and tightly focused intervention. Another reason L2 researchers use tests is to document interlanguage (i.e., what learners say or understand, when, and in which contexts) in order to theorize L2 learning and compare it to L1 or child L2 acquisition. Some L2 researchers strive to incorporate evidence about language acquisition into test development, and others investigate the tests themselves, with both educational objectives (e.g., validating test instruments) and theoretical objectives (e.g., defining constructs and models of acquisition).

Tests Used by L2 Researchers

Language tests used in L2 research are, generally, custom-made for the specific research questions or adapted from previous research. Each test is usually designed to measure (in either the written or oral modality) one construct, such as production of, comprehension of, perception of, opinion about, or online reactions to just one aspect of language competence. These aspects might include receptive vocabulary knowledge, one morphosyntactic paradigm or feature (e.g., inversion in *wh*-questions), one phonological process (e.g., word segmentation), one subset of pragmatic functions (e.g., apologizing), or one type of figurative speech (e.g., conceptual metaphors). A few studies, however, test several language features, such as a battery of morphosyntactic features (e.g., Ellis, 2005) or multiple aspects of pragmatic competence (e.g., Roever, 2005).

Alongside these custom-made tests, L2 researchers often also use general proficiency tests (e.g., IELTS, TOEFL) to allocate participants to groups representing stages of development. The purpose of such research is often to compare, either cross-sectionally or longitudinally, the results on the custom-made language tests across these different proficiency groups.

L2 researchers also use tests that tap into constructs such as aptitude, memory functions, and cognitive styles, or use self-report to elicit preferences and behavior data. They measure responses and reaction times in priming (Marsden, 2009; McDonough & Trofimovich, 2009) and eye-tracking experiments, as well as using neurolinguistic techniques. However, the focus of this entry is on instruments that measure direct evidence of language performance that was elicited for the purposes of the research.

Defining Constructs

Like any test designer, L2 researchers are concerned that their tests tap into the intended constructs. Defining these constructs is problematic, and four areas of debate are introduced in this section.

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

DOI: 10.1002/9781405198431.wbeal0657

Some L2 researchers argue that language competence is different from performance, meaning that representations of the L2 in the brain are not necessarily reflected by language performance on constructed response tests. This is one reason why some L2 researchers use selected response tests to elicit evidence about certain language features, that is, tests that are less similar to language use in the “real world,” such as grammaticality judgment tests.

L2 researchers are increasingly addressing another, possibly related, dichotomy (or continuum): Tests that elicit offline production or comprehension (i.e., language knowledge and use) can obtain different results from tests which elicit fine-grained perceptual measures of online processing (e.g., Roberts, Gullberg, & Indefrey, 2008).

L2 researchers are also aware of whether tests elicit explicit knowledge that the learner is aware of and is accessible given sufficient time, or implicit knowledge that is not accessible to consciousness and can be accessed under time and communicative pressures (Ellis, 2004, 2005; Hulstijn, 2005; Ellis et al., 2009; Sanz & Leow, 2010; Marsden & Chen, *in press*). Many consider that implicit knowledge is less prone to corruption over time and space (e.g., different linguistic, social, or task contexts). On the other hand, explicit knowledge appears to be learned faster and more accurately by older learners, and may interface with implicit knowledge, yet may be more prone to variability over time and space, and between individuals. Some tests tend to tap implicit knowledge, for example elicited imitation, discourse-level oral production tasks under time and communicative pressure, and some timed grammaticality judgment tests. Other tests, which tend to tap more explicit knowledge, include those in the written modality, without time constraint, and those of word- or sentence-level knowledge.

Researchers also generally recognize that language behavior varies across different contexts and over time. In general, L2 researchers agree that learners’ ability to do certain things can depend systematically, in many cases, on the measure used, and this impacts on research claims made. For example, Norris and Ortega (2000) found that when researchers measured outcomes using constrained response types (e.g., gap-fill), scores were up to three times higher than when outcomes were measured using metalinguistic judgment and free constructed responses (e.g., narratives) (see Tarone, 1998). Data from different linguistic and communicative contexts is therefore usually necessary to provide evidence about the stability (or instability) of a particular language feature, and it is widely accepted that some tests are better at eliciting certain constructs of language knowledge and use than others (Oller, 1983).

Test Design, and Related Methodological and Theoretical Concerns

Many test design decisions are similar to those facing mainstream test designers, such as which mode (production, comprehension, or both) and modality (aural, written, or both) to test as well as how to reduce bias due to test familiarity. As with all language tests, tests used in SLA research are subject to a play-off between internal and external validity. For example, more tightly controlled tasks tend to elicit more exemplars of intended constructs from more participants and to be more objectively scored, while the test is likely to be more artificial than more direct tests. However, high internal validity in terms of the research questions is paramount in L2 theory-building research, resulting in a tension between using ecologically valid measurements that could inform real-world problems (in, for example, education) and using measurements that could inform a learning theory. Many researchers aim to fulfill both these aims, which is another reason why batteries of tests are often considered preferable (Marsden, 2007).

Several challenges face L2 researchers designing tests to evaluate the effectiveness of one intervention type compared to another. For example, when measuring progression longitudinally, test scores may reflect a “learning from test” effect, a “maturational effect” (change over time), “regression to the mean,” or all three, rather than the intervening experimental experiences. These problems point to the importance of control (test-only) groups and different versions of the “same” test. Similarly, familiarity between an intervention and test can cause bias in favor of one type of intervention. In addition, as every educational intervention has some kind of beneficial aim (be it motivational or one aspect of language competence), it is important that either all the interventions being evaluated have *identical* aims so that they can be evaluated using the same tests, or the test battery measures the potential benefits of *all* interventions being compared (Marsden, 2007).

One of the most frequent objectives of tests in L2 research is to measure one specific aspect of language, such as use of a phonological feature (e.g., a consonant cluster) or a particular pragmatic function, as noted above. Some of the principal ways in which this is done are now considered (examples of L2 research using them are given by Chaudron, 2003; Norris & Ortega, 2003; Ellis & Barkhuizen, 2005; Mackey & Gass, 2005; Gass & Mackey, 2007).

Oral production is useful as an elicitation type because it is believed to minimally allow for learners’ access to monitored knowledge. Some examples include role plays, interviews, and communicative tasks (such as information-gap tasks) with non-native or native interlocutors, sentence and discourse completions, and story (re-)telling, in which participants can be given a visual or aural stimulus before or during the storytelling. One disadvantage of these production tests is that learners can avoid using certain language, making it difficult to distinguish a possible lack of competence from the possibility that the tests simply did not offer opportunity to display the competence. Tasks can be designed to make certain features “task-essential,” though there is an inevitable tension between successful elicitation of particular forms and the extent to which the task naturally focuses on meaning.

In order to “trap” as many exemplars of a certain form in as short a space of time as possible, a range of other tests can be used. Elicited imitation tests direct learners to reproduce orally a sentence they have just heard whilst retaining the same meaning (Erlam, 2006). Learners are usually asked to respond to the sentence (e.g., “Do you agree?”) before reproducing the sentence. The principle is that when a form is beyond the participants’ abilities, it is repeated incorrectly or omitted. Another common technique is grammatical (or acceptability) judgment tests, in which learners have to state whether they find a sentence acceptable/unacceptable, correct/incorrect, possible/impossible, or would/would not be said by a native. Learners sometimes have to indicate the location of any unacceptable language, provide corrections, or indicate degrees of acceptability on a rating scale, or do all of these. Researchers sometimes impose a time constraint, calculated according to native baseline timings, and applied to either the whole test or each individual item. A related test requires learners to express a preference for one of a pair of sentences that differ in some respect, or to decide whether sentences are identical or not. The latter is based on the principle that reactions to matching ungrammatical sentences are slower than to matching grammatical sentences. There is some debate as to the nature of the knowledge elicited by such tests (e.g., explicit and/or implicit) and the effects that different methodological permutations have on this issue.

L2 researchers use a wide range of other prompted-response experimental tests, which provide aural, written, or visual input, or all three, and can be delivered in a controlled environment via a computer, using software such as EPrime (www.psnet.com), or PsyScope (<http://psy.ck.sissa.it>) for Macs. For example, decision tasks require participants to choose between options, including pictures, sentences, morphosyntactic variants, referents, semantic or syntactic categories, or possible actors of a sentence. Other input-based techniques,

testing receptive language processing, include moving window reading or self-paced listening tests in which participants press a button to hear or see the next constituent, showing slower reaction times where difficulty increases.

There are also many ways of eliciting performance in which test takers can access explicit knowledge, such as written sentence or discourse completion tests or error correction tests. Gap-fill tests are commonly used, and can vary in terms of whether they are timed, whether the length of the missing feature is indicated, and whether picture or verbal prompts are provided (DeKeyser, 1990). Metalinguistic knowledge and awareness are also elicited via a range of tests, each with its own consequences in terms of validity and reliability (Elder, 2009).

Research into L2 lexical acquisition normally quantifies receptive and productive vocabulary via custom-made tests (e.g., yes/no recognition and word association tests) and analysis procedures, to measure constructs such as vocabulary breadth (size), lexical diversity (the number of different types of words used compared to the total tokens of words), sophistication (use of low-frequency words), density (the ratio of content and function words), and depth of knowledge (Malvern, Richards, Chipere, & Duran, 2004; Daller, Milton, & Treffers-Daller, 2007; Meara, 2009). Selected response tests assessing receptive vocabulary have been shown to have good reliability, perhaps more so than tests of other language domains (e.g., morphosyntax or pragmatics). Tests requiring productive vocabulary knowledge are, however, usually more dependent on the nature of the sample of learner language used to take the measurement (see, e.g., Marsden & David, 2008).

Scoring and Analyzing Tests

The scores from tests used in L2 research rarely have currency in the real world, and individual scores are usually anonymized. High-stakes testing is avoided to reduce factors such as anxiety, misconduct, or teaching to the test, which can threaten the validity of the results.

Nevertheless, as with any test, scoring performance is as central to validity and reliability as the test design itself (Weir, 2005, chap. 9). L2 researchers rarely use holistic, proficiency rating, or analytic scales. Instead, scoring and analysis are tied closely to the research questions (Ellis & Barkhuizen, 2005). Scoring is often discrete-point, with fixed denominators for constrained response tests, or is quantified in other ways. For example, production can be scored as “suppliance in obligatory contexts,” in which denominators vary between individuals according to the number of contexts for the target form they produce. “Target-like use” is a variant on this that takes account of oversuppliance of a target form. Such analyses therefore provide information about both intended functions (e.g., expression of subjunctive mood) and use of specific language forms (Bardovi-Harlig, 2000).

L2 researchers are acutely aware of developmental trajectories, including backsliding (where non-target-like production increases over time), U-shaped development (where production begins target-like, then becomes less so and eventually returns to target-like accuracy), and gradual grammaticalization (where development follows documented stages). In light of this, target-like accuracy is not the sole criterion for scoring learning, and criteria depend on the frameworks under investigation. For example, many researchers use “interlanguage scoring,” which rewards production of non-target-like language if this is considered to demonstrate development. Learners’ performances can be compared to developmental hierarchies (e.g., Pienemann’s, 2005, processability framework) in which the first non-formulaic production of a form (emergence) is evidence of acquisition, or performance can be compared to corpora that can be considered as baseline performance

(see www.spilloc.soton.ac.uk/; www.flloc.soton.ac.uk/; <http://talkbank.org/dataBiling-Bank/>). Other measures include accuracy, fluency, and complexity scores, such as counts of errors, pauses, words, or clauses per “unit” (e.g., per T-unit, which is a main clause plus any attached subordinate clauses) (Skehan, 1998; Ellis & Barkhuizen, 2005). In generativist and interactionist frameworks learning is usually evidenced by native-like production and comprehension, and by native-like rejection of ungrammatical language. Most acquisition researchers seek evidence of system learning, that is, the ability to generalize a pattern, be it lexical, grammatical, or pragmatic, across different linguistic contexts or exemplars, thus distinguishing between tokens (raw numbers) and types (different versions) of a feature, rather than the learning of unique items, whilst constructivist perspectives often consider item learning as a key unit of analysis.

Researchers have different criteria for excluding participants from their final data pool. For example, effectiveness-of-intervention studies often exclude scores above a certain threshold before the intervention. However, this can bias the results, as regression to the mean (a statistical phenomenon whereby those achieving below the mean are likely to improve the most, and those achieving above the mean are likely to improve the least) could account for the improvement documented. This measurement error can be compensated for by having control (test-only) groups.

Future Directions

Given the study-specific nature of tests used in L2 research, they are rarely standardized, in contrast to proficiency or achievement tests. Although researchers increasingly report the reliability of their tests, with indices such as Cronbach alpha, inter-rater, and test-retest reliability, there is a need to establish standards for the development, use, and evaluation of instruments for measuring language (Chaudron, 2003; Norris & Ortega, 2003). One current barrier to this is that access to testing instruments used in L2 research is not easy. Also, space-limited journals usually include a brief description or sample of tests, and there is an increasing variety and sophistication of instruments used to elicit data on the same or related constructs. This situation contributes to a paucity of replication L2 research and makes systematic reviews and meta-analyses difficult (Polio & Gass, 1997; Porte, 2008), thus impeding the accumulation of evidence systematically related over time and space and hindering the assessment of the validity and reliability of language tests used in L2 research. However, an international digital repository of instruments used in L2 research (IRIS) is now available at www.iris-database.org, and, once widely integrated into the community’s practice, this resource should help to address these concerns.

Language Testing in the Government and Military

MARGARET E. MALONE AND RACHEL LUNDE BROOKS

Introduction

Language testing in the context of the government and military most often refers to measuring language proficiency: the functional ability of personnel to complete operational tasks in the target language. While many associate government and military testing with proficiency testing, both government and military also rely on performance, aptitude, diagnostic, and achievement tests. Worldwide, government and military organizations face ever-increasing demands for personnel with various levels of language ability, providing a continual need for testing.

This entry addresses language testing in all government settings, including testing of civilian and military personnel. With such a broad, global scope, this entry focuses primarily on specific world areas that have had highly influential testing programs, such as the USA and Europe, and also provides information on international approaches to language testing, such as the North Atlantic Treaty Organization (NATO).

History

This section examines aspects of the history of language testing from post-World War II to the present, with an emphasis on government and military language testing in the USA and through NATO. While the emergence of the language testing field is traditionally associated with Lado's (1961) seminal work, the practical foundations for establishing standardized language testing had already taken root in the US military (Myron, 1944). For as long as language instruction has existed in academic and military contexts, there has been both formal and informal achievement testing. From the 1940s and 1950s, emphasis shifted to formal testing of proficiency, when the lack of aural/oral language skills in both the US military and the State Department helped drive the development of a national scale of proficiency in the 1950s. This development supported future standardization efforts internationally, and specifically in Europe.

Prior to the 1940s, government and military language training in the USA focused on reading rather than other domains. World War II and subsequent international conflicts illuminated the need for a focus on aural and oral language training (Velleman, 2008). American soldiers who had focused on reading skills were not linguistically prepared to meet the operational demands of their posts (Myron, 1944). With the shift of language teaching curricula toward more aural and oral methods came a shift in classroom testing practices. In the early 1940s, Kaulfers (1944) outlined a methodology for evaluating reading, aural, and oral language abilities, including rubrics and rating criteria, thus moving toward formalized military and government language testing.

The standardization of language testing was not only important for testing outcomes of language programs, but also for placing soldiers in language courses and determining

post-training assignments. By the 1950s, the US government had developed an increased interest in language aptitude testing, focusing on both general language aptitude and aptitude for translation (Petersen & Al-Haik, 1976). In the early 1950s, the Department of Defense produced the Defense Language Aptitude Test (DLAT); soon after, Carroll and Sapon produced the Modern Language Aptitude Test (MLAT) in 1959, and other aptitude tests followed. Although developed for academic contexts, the MLAT was widely used by government agencies in both the USA and Canada. By 1976, the DLAT was replaced by Defense Language Aptitude Battery (DLAB); since then, both the Defense Language Institute Foreign Language Center (DLIFLC) and the Federal Bureau of Investigation (FBI) have used this instrument to determine an individual's suitability for a particular language training course.

While establishing ways to measure aptitude was important, finding ways to test the proficiency of US government employees and soldiers remained an issue. In 1952, the US Civil Service Commission was tasked with inventorying the language abilities of government employees, and thus standardized assessment criteria and procedures were paramount. Important to the project was a way to assess language proficiency regardless of how the language ability was attained. As no such criteria were found in academia, the US government undertook an initiative to develop its own (Herzog, 2008).

The need for this effort was crystallized with the results of a 1955 survey of Foreign Service officers. This survey showed that not even half the officers had sufficient language ability to conduct their work. As a result, an independent testing office at the US Foreign Service Institute (FSI) was established in 1958, which worked to develop criteria in a format that could be implemented reliably, later known as the "FSI test." Although the movement to develop standardized test criteria and administration was initially resisted, the FSI developed a rating scale, with six numeric score levels (0–5). In 1968, other US government agencies joined with FSI to develop parallel sets of criteria to cover not only speaking, but also listening, reading, and writing. These criteria became known as the Interagency Language Roundtable (ILR) Skill Level Descriptions. In 1985, the ILR Skill Level Descriptions were accepted by the US Office of Personnel Management as the official criteria for evaluating the language proficiency of US government personnel.

Around the same time, the need for information sharing on language learning and testing gained international recognition. In 1966, the Bureau for International Language Coordination (BILC), an advisory body for language training matters for NATO, was established through funding from the British Ministry of Defence. Recognizing a similar need as the USA for standard testing criteria, BILC adapted the ILR scale to create a Standardization Agreement for language testing, STANAG 6001 (BILC).

In subsequent years, both the ILR Skill Level Descriptions and the STANAG 6001 have undergone revisions and influenced the development of testing criteria for nongovernment contexts. By 1985, the ILR Skill Level Descriptions had been revised to incorporate "plus" levels, making it an 11-point scale.

As the USA's first nationally recognized scale of language proficiency, the ILR Skill Level Descriptions were popular across government agencies and the scale's influence spread into academia. However, ILR Levels 3–5 were difficult to attain in a purely academic setting, and the functional acquisition nature of the scale needed modification. Therefore, in the early 1980s, the Educational Testing Service and the American Council on the Teaching of Foreign Languages obtained a federal grant from the US Department of Education and developed the ACTFL/ETS Proficiency Guidelines (Savignon, 1985). To accommodate the lower proficiency needs of academia, the lower levels were expanded to include sublevels, and the three highest levels (3–5) were condensed into one level (Superior). The four major levels received names rather than numbers (Novice, Intermediate, Advanced, and Superior), and, by 1999, all major levels except Superior included three sublevels: Low, Mid, and

High. In addition to being used in secondary school and university settings, a number of related rubrics have been developed at the lower-grade levels based on these Guidelines.

As the USA came to rely upon the ILR for government and academic language testing, language professionals in Europe and beyond also created a common scale. The Common European Framework of Reference (CEFR) was developed to be used across Europe, and is also used, in revised form, in countries (e.g., Japan) on other continents. The CEFR is used to provide a common standard for evaluation of language proficiency and for determining objectives for various courses of studies and expectations for outcomes. While the CEFR shares some characteristics with the ACTFL Proficiency Guidelines, it is independent. A few studies have been conducted to determine alignment between the two (Mosher, Slagter, & Surface, 2007), and the self-assessment instrument *LinguaFolio* adopts aspects of both the CEFR and ACTFL Proficiency Guidelines; however, no definitive studies have found high correlations between the two in operational testing.

While CEFR has been useful in a number of situations, NATO continues to rely on STANAG. For example, the STANAG 6001 scale has been pivotal in several international military initiatives. In 1994, the Partnership for Peace Initiative called for Central/Eastern Europe, Caucasus, and Central Asia representatives to fill NATO positions. Each of these officials had to meet STANAG requirements prior to selection. The mid-1990s gave rise to the Peacekeeping English Project, funded by the British Ministry of Defence and the Foreign and Commonwealth Office, which provided assistance to 20 countries in English-language training and testing according to the STANAG 6001 criteria (Green & Wall, 2005). Language training and testing using STANAG provides common information on the numbers of troops that can participate in multinational efforts; proficiency of such participants must be certified by the STANAG scale. Such a proficiency certificate is a marketable plus on the civilian job market after retirement from the military.

Significance and Contributions

Language testing in the government and military has not only made a significant impact on the language testing and teaching communities, but also has contributed a great deal to the advancement of these fields across the world. This section reflects upon the significance and contributions of government language testing during the 20th century and considers how it has contributed to the development of additional tests.

Significance: Development

Language testing in the military and government has always been driven by operational demands. Historically, government and military agencies have used proficiency measures to evaluate the suitability of employees for language-related positions because these entities needed personnel that could complete a wide range of language tasks. These personnel, often referred to as “linguists,” have typically been assessed in foreign language reading, listening, and speaking abilities, with the goal of ILR Level 2 or Level 3 proficiency, depending on the needs of the agency.

In the late 20th century, an interagency organization known as the Center for the Advancement of Language Learning (CALL) was established in the USA. One of the main efforts of CALL was interagency collaboration on language training and testing issues, including ensuring uniformity of testing standards and comparability of language tests given among different agencies. Various proficiency projects were established through CALL funding, including the Speaking Proficiency Test project to examine comparability in oral proficiency testing across government agencies. CALL’s funding was discontinued in 1999; consequently, interagency collaboration was affected.

Around the turn of the millennium, the quantity of language assignments in the government and military increased manifold, and the range of languages required to fulfill these assignments not only broadened considerably, but continued to evolve (Nordin, 2001). The constant shift in operational language needs led to a continuing search for linguists who could meet the requisite high level of language proficiency for government positions. In order to meet the challenge of finding qualified linguists that could handle any task, government agencies began to meet their operational obligations by cultivating linguists who were specialists in certain types of language tasks. Initially, speaking proficiency tests became more and more tailored to the functions of a particular position rather than measuring general proficiency. Consequently, language testing evolved from a dependence on proficiency testing to the development of performance tests that were better suited to the needs of particular agencies. This shift was supported by research which indicated that proficiency scores were not reliable indicators of competence for language tasks such as translation (Lunde & Brau, 2005, 2006). At the FBI, exams were developed in listening, summary translation, verbatim translation, interpretation, and English monitoring. As a result, the ILR has produced Skill Level Descriptions for selected performance skills, including translation, interpretation, and audio translation.

Language Testing Today

Current government language testing has come far from the days of only proficiency and aptitude tests. In recent years, diagnostic testing has been used in various programs in an attempt to identify a learner's linguistic strengths and weaknesses so that they may advance their proficiency to the next level. Today, the reasons for language testing are varied, and language testing recurs throughout careers of US government and military personnel. Test scores are used for a variety of reasons, such as determining employment eligibility, job placement or assignment, promotion, incentive pay, and achievement.

Today, both the ILR and STANAG scales are still used, with the STANAG 6001 currently in its third edition, released in early 2009. BILC nations share resources and provide support for emerging military testing and training programs through workshops as well as site visits (J. DuBeau, personal communication, 2010). Similarly, the ILR still meets monthly in Washington, DC, and its testing committee continues to review and develop ancillary materials for the ILR scale (ILR, 2009), such as self-assessment guides and tutorials. Additionally, the ILR has undertaken development of Skill Level Descriptions for performance in translation (2006) and interpretation (2007), with other sets in development.

The beginning of the 21st century has brought about renewed collaborative efforts among agencies not only in the USA, but among government language testing programs around the world. Efforts in North America include regular interagency summits and research projects aimed at reestablishing communication and ensuring concurrent validity between agency tests. Agencies within the USA and among different national governments have shared established tests and testing resources. This collaboration has been particularly beneficial in languages determined to be of critical need, but the resources, both financial and of personnel, remain limited. Language testing is no longer an issue of interest only to the large agencies, such as the Department of State and the Department of Defense; smaller agencies have also been touched by the need for reliable language personnel on their staff. As this need continues to grow, efforts have been made to establish standards for developing and administering government tests by private or commercial organizations. Moreover, research into automation of test administration and scoring has led to a wider availability of testing resources.

Controversies and Issues

The government and military are inevitably political; therefore, as government and military language testing has contributed to the field, it has raised a number of controversies and ongoing issues. This section describes the controversies involved in the very existence of aptitude testing, the validity of the ILR Skill Level Descriptions, and criticisms of that scale and its spin-offs, such as the ACTFL Proficiency Guidelines. The reliability of the CEFR is also discussed, as well as the inherent difficulty in testing proficiency versus performance for government and military uses. The final issue examined is that of language pay.

Language aptitude testing provides an opportunity for government agencies, and particularly the military, to strategically use resources in only providing language training to those who are most likely to attain proficiency quickly (Petersen & Al-Haik, 1976). While cost savings is an important issue, equity is also important. Therefore, the issue of the validity of aptitude testing, and the potential impact for those who are not allowed access to language training based on low aptitude, emerges as a concern.

A second, and thorny, issue is that of the validity of the ILR Skill Level Descriptions and ACTFL Proficiency Guidelines. Although both scales are experientially grounded, the operational demands of the US government have allowed few resources to be devoted to publishing the empirical research that supports their construct. Consequently, the validity and application of the scales has been questioned by a great number of those in the field of language testing (e.g., Lantolf & Frawley, 1985; Bachman & Savignon, 1986; Chalhoub-Deville & Fulcher, 2003). Among other criticisms, researchers have questioned the native speaker ideal as the focus of the scales, as well as the lack of alignment of both scales to any construct of language acquisition. Lowe (1986) and others have defended the scales by stating that much of the criticism arises from misunderstandings of the scales' purposes and implementations. Despite these criticisms, the scales continue to be the most-used reference for measuring language proficiency in both government and academic contexts (Liskin-Gasparro, 2003).

The reliability of the CEFR is also in question. While the CEFR has been developed for widespread use across Europe and the world, the lack of a common test (such as the ACTFL Oral Proficiency Interview) makes common standards for reliability challenging. While North and Jones (2009) have recommended procedures for establishing reliability across different implementations of the CEFR, the lack of centralization and the diversity of users across the world will make reliability and alignment across different CEFR testing instruments challenging.

While language proficiency assessment may demonstrate the extent to which a proficiency level has been attained, it is equally important to ensure that the level being attained is adequate for the job being carried out (Jackson & Malone, 2009). It is not enough to test proficiency level; it is also vital to ensure that those being tested have attained levels that will not jeopardize their own and others' safety, and that responsible standard-setting studies are conducted. For government and military, such efforts are critical; standard-setting studies must be implemented to ensure that government and military testing is appropriate for the jobs for which such language is intended.

One potential result of the proposed studies and the establishment of such levels is incentive pay for language proficiency. A number of US government agencies offer incentive pay for individuals who have attained, as demonstrated through testing, proficiency levels needed for either current or potential tasks required by their employer. While this is laudable and encourages the development and maintenance of language proficiency, it also exerts pressure on language testers, who may feel compelled to give high ratings to ensure their colleagues' language pay. Oversight and inter-rater reliability studies,

including with raters outside of specific agencies, may help to alleviate the appearance of unreliability in ratings.

Future Directions

Language learning—and, therefore, language testing—becomes increasingly important with the growth of international communications in daily life. In order to reliably document and maintain high standards of language abilities, it is critical for language testing in the government and military to be accurate and fair. Comparability of language testing systems and standards must be explored and promoted worldwide. By ensuring the quality of people's language skills, proficiency testing can help to forward the goal of effective government and military communication, promoting international cooperation.

Language Teacher Training in Technology

GREG KESSLER

Teacher training in computer-assisted language learning (CALL) is an emergent area of increasing interest and varied influences. As CALL has evolved in recent decades, it has resulted in a complex and diverse array of instructional opportunities. Teachers are faced with a multitude of choices involving environments, resources, student abilities, mobility, automation, and access. Teachers are often overwhelmed by the technology that is available to them and feel unprepared to make informed decisions about the selection, creation, and use of a particular technology-based tool or resource. They are also generally uninformed about the potential assistance that technology can provide them with in their language-teaching pursuits, even when extensive resources are available to them (Ertmer, 2005; Kessler, 2007). It is clear that teachers are likely to use CALL when they appreciate the value it can add to the classroom, and they are likely to make better decisions about using CALL when they are properly prepared. Consequently, two important goals of training include raising awareness of CALL potential and reflecting on the decision-making process.

A Need for CALL Teacher Training

Research into CALL teacher training is a relatively new phenomenon, yet it has produced some interesting information. Recent research has suggested that teachers may not implement CALL following formal preparation (Egbert, Paulus, & Nakamichi, 2002). Other studies have found that formal CALL teacher training is often not required or available within preservice teacher degree programs, and when it is addressed it may be inappropriate, ineffective, or insufficient (Kessler, 2006; Hubbard, 2008). Other studies have suggested that CALL teacher training does not provide appropriate breadth (Peters, 2006), contextualization (Egbert, 2006), or attention to individual teachers' needs (Kessler, 2010). Perhaps for these reasons, graduates have reported dissatisfaction with the quality and nature of their CALL preparation (Kessler, 2007). Yet graduates of teacher preparation programs have indicated that they value CALL training, particularly preservice training within degree programs. In these contexts preservice teachers have expressed an appreciation for theory as a foundation for building necessary knowledge and skills (Slaouti & Motteram, 2006; Kessler, 2010). Thus, it has become necessary for language-teacher preparation programs to reflect on their CALL training offerings.

Much of the research into the use of CALL among language teachers has indicated an increased need for training. Kessler and Plakans (2008) noted a general lack of technology use in language curricula and practice. The authors also observed that CALL use may simply mimic traditional classroom practice while lacking and neglecting the potential to customize learning for individuals. Bax (2003) suggests that normalization, or the full integration of CALL within language pedagogy, should be the goal of CALL practitioners. Such normalization requires that teachers be as familiar with and conscious of aspects of CALL as they are other instructional tools such as pencils, books, and chalkboards. Chambers and Bax (2006) identified various barriers to normalization along with suggestions for overcoming many of these problems. Integrating technology into curricula and

scheduling teachers to use technology spaces are foremost among their recommendations. However, some researchers have observed that the goal of normalization may be hampered by a lack of formal preservice teacher preparation for the use of CALL (Kessler, 2006; Peters, 2006; Hubbard, 2008) as well as a lack of contextualized training (Kessler & Plakans, 2008) and limited opportunities to reinforce the skills learned in CALL preparation after training is completed (Egbert et al., 2002; Hegelheimer et al., 2004). Barrette (2001) found that skills not practiced repeatedly were easily forgotten. Kessler and Plakans (2008) suggest that teachers be prepared in contexts relevant to their current teaching environments so that they may develop contextual competence in order to retain skills. Other studies have observed that technology integration among language teachers may rely more on individual teachers' backgrounds and use of technology in personal contexts than on the formal preparation that they receive (Egbert et al., 2002; Kessler, 2007).

Types of CALL Teacher Training

As research has found, both formal and informal approaches can remedy the current shortcomings in CALL teacher training. CALL training should provide insight into how students use technology. While teachers do not need to be familiar with the entire body of CALL-related research, they should have some understanding of the common pedagogical implications. Research investigating the use of computer labs, online environments, and mobile devices in student language learning should be accessible and well known to teachers, who should be familiar with a variety of technology tasks and activities that may be used for teaching individual and integrated language skills. Teachers should be aware of research into the way students interact in groups when using technology; they should also be prepared to perform action research or to reflect meaningfully on the way they integrate technology into their own teaching.

Formal CALL teacher training appears to have taken on numerous forms. Hubbard (2008) identified three primary types of CALL training courses, including breadth-first programs that provide a survey of the field of CALL prior to deeper investigation, depth-first programs in which teachers extensively learn how to use specific software prior to learning about other CALL topics, and online programs which utilize distance learning both as a means of instruction and a CALL-related topic. A variety of specific approaches have been outlined, including training that is programmatically integrated (Hegelheimer, 2006), and situated in specific contexts (Egbert, 2006).

Some have also offered informal alternatives to formal degree programs, including autonomous self-directed learning (Robb, 2006), communities of practice (Hanson-Smith, 2006), and formal mentoring (Meskill, Anthony, Hilliker-VanStrander, Tseng, & You, 2006). Integrated or institutional CALL use throughout language programs is often not available due to the overall lack of CALL teacher training. Often a single faculty member within an institution is familiar with CALL-related practices, thus relegating use to decentralized and individual practice rather than pedagogically integrated practice. Such isolated activity is not likely to be successful and often results in frustration for both faculty and students, as use of technology tools varies so dramatically from one term to the next. In order to encourage institutional expectations for CALL use, in-service, contextualized training can be introduced. There have been suggestions, however, that this short-term training may be inadequate for teachers who require more pedagogical context in training (Kessler, 2007) or those who feel overwhelmed when faced with changing technology needs (Kessler & Plakans, 2008). While much teacher training is done as short-term or in-service professional development, little research exists on the outcomes of this type of CALL teacher training.

What Language Teachers Need to Know About CALL

Hubbard (2008) outlined proposed roles of language-teaching professionals in respect to CALL. While the more advanced of these involve expertise in CALL, the expectation of proficiency with CALL for all language teachers is notable. This expectation is consistent with the teachers of English to speakers of other languages (TESOL) *Technology Standards Framework* (Healey et al., 2008). These standards set goals for teachers to use technology both in and out of the classroom for language teaching as well as for record-keeping and ongoing CALL-related professional development. These standards require an awareness of the usefulness of general desktop software (such as word-processing software, presentation software, and media players and editors), as well as online collaborative environments (such as virtual worlds, blogs, and wikis) and CALL-specific software (such as pronunciation tutorials, grammar tutorials, and writing aids). These expectations also suggest an ongoing need for investigation into effective CALL teacher-training practices. According to Hubbard (2004), students need to be trained to use CALL tools effectively. Such training requires that teachers are comfortable and confident with the CALL tools themselves.

Skills That Teachers Need to Implement CALL

While a foundational level of digital literacy is essential for any professional in our technologically sophisticated world, these skills alone should not be considered adequate. Just as professionals in other disciplines need to master technology tools, practices, and resources specific to their work, language teachers need to develop proficiency with CALL. Language teachers should be able to work with a variety of media that can greatly enhance language instruction, including text, images, audio, and video. Kessler (2007) found that graduates of TESOL MA programs were generally comfortable when working with text but did not feel confident about dealing with images. They were even less comfortable when working with audio and video materials. These forms of media offer great enhancement in the language classroom. Further, teacher comfort with technology may be misleading. Kessler and Plakans (2008) observed that university ESL teachers who were highly proficient with technology were less likely to use technology in innovative and integrated ways. Rather, those teachers who were less confident with technology demonstrated greater consideration and reflection when using technology in the classroom.

CALL teacher training and the development of technology skills, therefore, needs to maintain a focus upon pedagogical practice. Essential skills for the teacher range from the ability to evaluate the quality of Internet resources to the creation of each and every aspect of CALL-based instructional activity for specific groups of students. Within this spectrum there are numerous activities that can address pedagogical goals. Each of these skills can be directly applied to a range of CALL tools, resources, and practices. To illustrate this we can look at a single language classroom resource that may be used in numerous ways with different students in different classrooms for different purposes. In the following example the resource is a brief video (2–5 minutes) in the target language about a cultural event with a series of images and embedded text that is also read by a narrator. Table 1 includes skills that all classroom teachers should be able to demonstrate.

At the basic level a teacher is able to locate, evaluate, select, distribute, and integrate digital materials for instruction. At this level the presumption is that a teacher is not creating any materials but rather relying upon gathering from the wealth of existing materials available on the Internet, through communities of practice or otherwise shared with local and remote colleagues. Table 2 illustrates advanced skills that offer teachers greater control over materials.

4 LANGUAGE TEACHER TRAINING IN TECHNOLOGY

Table 1 Basic CALL skills for classroom teachers

<i>Skill</i>	<i>Teacher action</i>
Locate	Use Internet search engine to find relevant movie files
Evaluate	Watch videos to determine if the language level is appropriate, if the content is accurate, if the quality of video is acceptable, etc.
Select	Select the file that best meets pedagogical needs
Distribute	Determine the best means for distributing a video file to students, including Web links, CDs, local files, etc.
Integrate	Construct a language lesson around the content of the video file that utilizes the images, audio, and text in meaningful pedagogical ways

Table 2 Advanced CALL skills for classroom teachers

Create	Create a video using a combination of personally created images, text, and voice recordings
Customize	Edit the movie file expanding the narration with a more challenging version for a higher-level class
Convert	Edit the movie file deleting the audio to utilize as a reading activity
Repurpose	Use instructional materials, media, or technology in multiple contexts with relatively minor alterations

As they progress, teachers are able to create, customize, and convert these materials for enhanced instruction. A teacher with these advanced skills has much greater control over the materials. Each step in the process gives increased control over decisions about each aspect of the project including the exact images used, vocabulary, speed of narration, etc. While this example is constructed around a video, the same skills can be applied to other resources and CALL-specific programs as well. Teachers are provided with opportunities to practice these skills in a meaningful context and are therefore more likely to retain what they learn.

Technology access varies dramatically across educational contexts. CALL teacher training needs to acknowledge the realities that teachers are likely to face after graduation. Schools may lack computers, reliable Internet access, or regular computer maintenance. In some cases, teachers are likely to be dealing with donated, obsolete or inoperable equipment. Reliance upon such equipment has a negative influence on teachers who might otherwise attempt to utilize technology in their language classes. It is important to identify a range of possibilities for instructional enhancement from a one-computer classroom to a fully immersive virtual environment. Further, providing teachers with skills and practice at troubleshooting common problems can help to increase confidence and use.

Adapting to New Technologies and New Teaching Contexts

Some have suggested that teacher preparation for CALL should address universal skills that can be used to exploit a variety of software and contexts (Hegelheimer, 2006; Slaouti & Motteram, 2006). This understanding is critical as it also encourages teachers to adapt

their extant knowledge and skill-set to new circumstances. For example, learning to copy and paste text inside a word-processing program can extend to copying and pasting text across applications (such as from a Word document to a Web browser). This same knowledge can be used to copy and paste audio and video in media-editing applications. Learning this one simple skill can allow teachers to create media-rich resources for their students. Not only can teachers learn to transfer their abilities across a spectrum of types of technology, they can also learn to transfer the use of these customized materials across teaching contexts. Audio and video materials that are created for a language-listening exercise may be just as useful in a reading exercise if they are pedagogically sound. Such materials may also be altered for new contexts or language levels. The ability to create, alter, and adapt materials is only limited by a teacher's awareness of the potential of CALL. Further, it is important that teachers develop the understanding that technology is an ordinary resource, not something exotic to be used only on special occasions.

The Future of CALL Teacher Training

We are just beginning to address language teachers' needs regarding CALL. As technology continues to improve, the availability of CALL teacher training is likely to increase. We can also expect that such training will become more common as a required component of language teacher preparation programs as well as in other professional development contexts. As CALL becomes more broadly integrated into language-teaching programs, it should also become integrated into teacher preparation and ongoing workplace professional development plans.

Language, Culture, and Context

CLAIRE KRAMSCH

Introduction

Language in its relationship to the culture that it represents and the context in which it is used has been researched in fields as varied as functional linguistics, linguistic anthropology, cognitive linguistics, sociolinguistics, psycholinguistics, and the sociology of language. Each of these fields has its own theoretical underpinnings—some based in linguistics proper, some based in social and cultural theory, others in critical theory—and they are located to various degrees in a structuralist or a post-structuralist tradition (for a review from a pedagogical perspective, see Risager, 2007). The study of language in its social and cultural context is a cross-disciplinary endeavor that has been applied to real-world problems like the teaching of foreign languages and cultures (e.g., Byram, 1989; Kramsch, 1993, 1998; Risager, 2006) or professional encounters between doctors and patients, lawyers and clients, business executives and their customers in the general field of applied linguistics and intercultural communication. As an empirically based domain of research in the social sciences, it explores the relation between the three notions included in the title of this entry.

What Is in a Language?

Several notions are essential to understanding language in relation to culture and context. In the triad “language, culture, and context,” language is not a bunch of arbitrary linguistic forms applied to a cultural reality that can be found outside of language, in the real world. Without language and other symbolic systems, the habits, beliefs, institutions, monuments that we call culture would be just observable realities, not cultural phenomena. To become culture, they have to have meaning. It is the meaning that we give to behaviors, foods, and ways of life that constitute culture.

Unlike the linguistic system that is the object of study of theoretical linguists and the grammatical system taught by many language teachers, language-in-context is seen as a coherent symbolic system for the *making of meaning*. To borrow a phrase from M. A. K. Halliday (1978), it is a “social semiotic,” in other words a system of signs that are both arbitrary in their form and motivated in their use. For example, the fact that the same person can be referred to in the English language by nine letters “i-n-s-u-r-e-n-t” or two times seven letters “f-r-e-e-d-o-m f-i-g-h-t-e-r” shows how arbitrary these signs are in their form, but of course the choice of one sign over the other is not arbitrary at all; indeed, in this case it is politically motivated. It says something about journalists’ political perspective and how they position themselves vis-à-vis the events they report on and vis-à-vis their readers.

In its use, the linguistic sign means more than its dictionary definition. M. A. K. Halliday developed a systemic-functional way of describing language as social semiotic. He asked: How does the structure of language reflect, express, and shape the structure of the social group in which it is used? He found that language as symbolic system has a triple relation to social reality: (a) It represents social reality by referring to the outside world, for instance

2 LANGUAGE, CULTURE, AND CONTEXT

a world of wars and insurgencies; (b) it expresses social reality by indexing social and cultural identities, for instance the political leanings of a speaker or writer; (c) it is a metaphor for reality as it stands for, or is iconic of, a world of beliefs and practices that we call *culture*, for instance, in the case at hand, the military culture of a nation at war, or the culture of well-balanced journalism, or a national culture that tends to divide the world into friends and foes.

Representation, indexicality, iconicity are processes of meaning making and of the making of culture. Because the focus is on the active processes of language use, rather than on the formal properties of a linguistic system, applied linguists like to use the term “discourse” instead of “language” when they study the links between language and culture. Pennycook sees verbal discourse as only one of the many modalities in which culture gets constructed:

[D]iscourse does not refer to language or uses of language, but to ways of organizing meaning that are often, though not exclusively, realized through language. Discourses are about the creation and limitation of possibilities, they are systems of power/knowledge (pouvoir/savoir) within which we take up subject positions. (Pennycook, 1994, p. 128)

James Gee broadens the notion of discourse to encompass all aspects of what we usually call “culture”: “A Discourse is composed of ways of talking, listening, reading, writing, acting, interacting, believing, valuing, and using tools and objects, in particular settings and at specific times, so as to display or to recognize a particular social identity” (Gee, Hull, & Lankshear, 1996, p. 10). For him, cultures are not only national entities, but any group linked by common interests or history. For example, law-school teachers and students enact specific social identities or “social positions” in the discourse of law school. This definition brings to the fore the tension between social convention and individual creativity that characterizes both language use and cultural context. Discursive practices have offered a fruitful methodological framework for studying the language, context, and culture nexus (Kramsch, 1993; Hanks, 1996; Risager, 2007; Young, 2009) as well as intercultural communication (Scollon & Scollon, 2001).

What Is in a Context?

How does culture shape and get shaped by discourse? In other words, how is a text related to the context in which it is produced and received? Barbara Johnstone (2008) identifies six aspects of the mutual shaping of texts and contexts.

Referential. Words refer to a social reality. But they also shape our perception of that reality and in turn social reality channels our use and misuse of words. Thus we can say that texts and their interpretation are shaped by the social, cultural, historical realities to which these texts refer and, in turn, texts contribute to shaping the very realities we live by. One prime example is the branding practices of the marketing industry. By carefully studying what words have the most desired emotional impact, marketing strategists like Frank Luntz can literally make people buy and wear Nike sneakers or drink Pepsi-Cola and thus change their way of life. As Pepsi and Nike become global commodities, the discourse used to advertise them shapes a global culture that threatens to supplant local national or regional cultures.

Structural. The spoken or written texts we produce are molded by what the language allows us to say, its grammatical affordances and constraints, its lexical resources. For example, English grammar shapes American newspaper headlines and thus sways American public opinion in ways that are different from German or French newspapers.

In turn, the context molds linguistic structures and even creates new ones, as is shown in the newspeak of Internet communication.

Interpersonal. While traditional grammars describe texts as formed of sentences, a discourse approach to language considers language as formed of utterances, produced by speakers, writers, or bloggers who want to make contact with other speakers and writers. Thus discourse is shaped by interpersonal relations among participants, whose social and cultural ties in turn shape what it is socially appropriate to say or write. For example, the reshuffling of social relations and cultural expectations through the Internet is realigning interpersonal relationships and reshaping the relation between the younger and the older generation in culturally dramatic ways around the globe.

Textual. Our utterances are not only constrained by the expectations of our interlocutors or readers, but by the expectations built over time by prior discourses, stored in memory, recorded on tape, or archived in libraries. These prior texts constitute intertextualities that channel our expectations about what future discourse will be like and how it should be interpreted. For instance, Martin Luther King's famous phrase "the fierce urgency of now," spoken on August 28, 1963, was referred to by Barack Obama in his campaign speech in Milwaukee on February 15, 2008, and is repeated in English and in Spanish by a US military ad to recruit Hispanics into the US army, thus adding an ambiguous surplus of meaning to all the texts involved.

Medial. The new information technologies have made it clearer than ever that texts are dependent on the technological dimensions of the contexts in which they are produced. We make meaning differently in face-to-face interactions, in handwritten or typed letters, on the telephone, via e-mail, in blogs, or on Facebook. Each technology has its generic conventions. The limitations and possibilities of the media influence what we may say (e.g., the small screen size of a Japanese cellphone novel) and, in turn, what we want to say prompts computer scientists to invent new media technologies (e.g., the demand for the speedy exchange of information was both the cause and the effect of the invention of the fax machine).

Silential. This last dimension points to the ultimate paradox of language in context. Language has to leave so many things unsaid in order to say many things. How do we choose among the many things that could be said? The utterances we speak, hear, read, and write are molded by our interests, our beliefs, our needs and desires, in short, our purposes. In turn, our needs and desires are molded by the range of available and possible words. For example, as Ian Hacking brilliantly argued, some mistreatments of children would not even be talked about nowadays if the term "child abuse" had not been coined in 1966 and brought into wide circulation (Hacking, 1999). A phenomenon that has no name has no social existence. The silential dimension of language points to one of the most vexing tensions between social convention and individual creativity; it highlights the symbolic struggles going on in the meaning-making world of culture.

What Is in a Culture?

It is not usual to view culture as a site of struggle. And yet, if we consider culture to be *the meaning that members of a social group give to the discursive practices they share in a given space and time and over the historical life of the group*, it is to be expected that not all members of a social group will agree on which meaning should be given to social phenomena and historical events. Culture is characterized by tensions between a shared dominant discourse (e.g., a national ideology), imposed by powerful institutions, and particular discourse varieties shared by social groups or individuals brought together by family, professional, ethnic, gender, or age-related ties. This tension is characterized by a struggle for the right to make meaning and to have that meaning shared by others. It is a struggle not only to

be listened to, but also to occupy a dignified subject position in space and history, and to have control over social reality and cultural memory.

The growing spread of a global culture of economic mobility, social change, and individual entrepreneurship has brought about a pressure to deinstitutionalize, deterritorialize, dehistoricize, and decontextualize national cultures in favor of a “flat” world of privatized, portable, flexible, and stereotypical cultures that can be reappropriated by the marketing industry in the service of a new fast capitalism. The commodification of culture is of great concern to critical applied linguists like Fairclough (2006) and Block and Cameron (2002). It has prompted some to search for a transnational language pedagogy to teach a more flexible “languaculture” (Risager, 2007). It has prompted others to advocate taking a more ecological perspective, one that views cultural events as embedded in multiple timescales (Lemke, 2000; Fill & Mühlhäusler, 2001; van Lier, 2002; Blommaert, 2005), all coexisting in what Blommaert calls “layered simultaneity” (2005, p. 130). Thus, for example, we find in the same place on the map: the slums in Mumbai (premodern timescale), a jumbo jet flying overhead (modern timescale), and the Internet access afforded by a Western visitor’s laptop (late modern timescale)—all sharing the same space, but giving a multilayered meaning to the culture at hand and to the texts that such a culture produces.

Given the resulting fragmentation and homogenization of cultures, it is all the more necessary to be vigilant about how we use language to accelerate or on the contrary to slow down the forces of cultural hegemony. As several applied linguists have pointed out, countertrends are creating new ways of making meaning that are emerging as quickly as traditional cultures are being homogenized. Pennycook (2007) shows how rap culture and other forms of popular culture borrow from and diversify dominant cultures. By underscoring the performative aspect of verbal performance, he points to the potentially transformative impact of verbal art on the global culture of the young. Coupland (2007) and Rampton (1999) show the growing importance of style and stylistic variation in understanding culture. Blommaert (2005) emphasizes the importance of bringing back a historical perspective in the interpretation of cultural events. The current attention given to the symbolic and its impact on human emotions and subjectivity (see below) opens up new ways of being authentic and of defining “truth.” We notice a renewed attention paid to the playful and the aesthetic dimensions of culture (Kramsch, 2009).

Language as Thought and as Communicative Practice

Making meaning inevitably raises the question of the relation between the way we speak and the way we think. If culture is the meaning we give to things, persons, and events, how do we explain the relation of mind and culture? Do words in one language make you think of things you could not even think of in another language? While language relativity has been a contentious issue ever since Whorf proposed the Sapir-Whorf hypothesis in the 1940s, it has now become a well-established fact that language shapes our thoughts and that learning a foreign language can give us new and unexpected thoughts (for a survey, see Kramsch, 2004). Cognitive linguists have found that the mind makes meaning through conceptual metaphors or idealized cognitive models of reality (ICMs), which are both mental and linguistic, and reflect and shape the way we view the world (Fauconnier & Turner, 2002). These ICMs can open up new ways of understanding the context in which we live (e.g., the metaphor *LIFE IS A JOURNEY* can give us the patience necessary to achieve our goals in life), but they can also restrict our understanding by making meaning seem fixed and unitary. These metaphors are not just nice figures of speech, they are mental spaces that shape a group’s worldviews, attitudes, and beliefs—its culture—and make them seem natural.

The fixing or naturalization of meaning is of concern to applied linguists who study the relationship of language and ideology (e.g., Cameron, 2000; Fairclough, 1992). They note the increased commodification or instrumentalization of discourse (brands, logos, slogans, euphemisms, and other “hidden persuaders”) for political or marketing purposes, exacerbated by the scope and speed of computerized communication. They also note that in a computerized culture, the notion of author has become increasingly problematic. On the one hand, “authors” of e-mails, blogs, tweets, and so on seem empowered in their ability to reach and network with others; on the other hand, the authority and legitimacy of their subject position seems less secure than in a traditional culture with greater institutional safeguards.

Text, context, and culture come together in the communicative practices of everyday life. Hanks (1996) shows how the most mundane language we use in everyday life is saturated with context. A simple exchange between Jack and Natalia at breakfast—“‘D’the paper come today, sweetheart?’ ‘It’s right on the table’”—makes meaning for the participants because all the contextualization cues (*the paper, the table, today, sweetheart, it*) point to a familiar environment, a familiar routine, a familiar human relationship—a communicative practice enacted by two habitus exquisitely attuned to each other. Their discourse bears traces of historical sedimentation and symbolic reenactments of the discursive practices that constitute their home culture. Communicative context has usually been studied in real life. But what about computer-mediated communication (CmC)? The increasingly multimodal nature of communication requires a sophisticated interpretation of what context and culture mean online and how they can be exploited to teach foreign languages and cultures.

Language, Politics, and the Nation-State

JOHN E. JOSEPH

The “nation-state” is the concept of a continuous expanse of territory occupied in the majority by the people that has traditionally inhabited it, and governed autonomously by them. This people is assumed to be ethnically and culturally unified, with the principal cultural manifestations of their unity being shared religion and language.

In mainstream political thought for a period starting in the first decade of the 19th century and continuing to the early years of the 21st, the nation-state was taken to be an entity grounded in natural justice and rights, representing the best path to the peaceful coexistence of peoples. This ideology arose with the German Romantics, in opposition to Napoleon’s ambitions within Europe, ambitions connected with the ongoing struggle of the European powers to amass overseas empires greater than one another’s (see Joseph, 2006a).

Since then, it has been usual to think of the nation as something natural and organic, while the state, insofar as it is not coterminous with the nation, is artificial and arbitrary. In recent work on the ethics of identity, however, Appiah (2005, p. 244) argues that “if anything is arbitrary, it is not the state but the nation.” Nations matter because of how individuals feel about them, based on shared experiences, especially of texts of various kinds. “States, on the other hand, have intrinsic moral value ... because they regulate our lives through forms of coercion that will always require moral justification” (p. 245). This is particularly so in the wake of the 20th-century legacy of states undertaking “ethnic cleansing” through genocide, in order to turn the nation-state ideology into a reality on the ground, when the rise of minorities were perceived as a threat to it.

While Appiah’s point about nations being arbitrary is well taken, the fact is that states are rescued from total arbitrariness only through texts, myths, and narratives connecting them to national identity. This can be a matter of shared descent; of a shared history of suffering, defeat, and triumph; of shared religious belief, especially if persecuted; and of shared language, which is taken as the proof of a shared national mind and soul. A national language is the ultimate unifying narrative—so it is not surprising that states invest so much effort and resource in fixing a standard form of the language and trying to control the inevitable forces of change and break-up into local varieties, as well as ensuring that the children of immigrants, if not the immigrants themselves, take up the national language, rather than or along with the home language, as their vehicle of identity.

The brief and necessarily incomplete survey which follows illustrates various ways in which nation-states have been imagined, reimagined, or unimagined through the politics of language: in the multistate peninsula of Iberia, the multinational state of India, the stateless Iroquois nation, and the nation-states of Ireland and Israel.

Iberia

The Renaissance saw the transition from a Europe of divine dynasties to one of political nations. The new ideology of nationalism stimulated the creation of national languages—French, Italian, Spanish, German, English, Danish, and so forth, starting from the basis of some existing dialect but remaking it, principally on the model of Latin, so that it would

have what it took to be perceived as truly a “language,” a fit vehicle for divine knowledge (see Joseph, 1987, 2006b).

The great question was which of the patchwork of spoken dialects that characterized each corner of the European landmass would be the basis of the new “national language.” In principle any of them could fulfill this function, but in reality some of these dialects were championed by politically or culturally powerful partisans, others not. The *Diálogo de la lengua* (1737/1965, first written 1535–6) by Juan de Valdés is typical of a genre of this period in which arguments are made asserting the advantages of one vernacular dialect over others as the basis for the nascent national language. Valdés ties the presence of linguistic diversity directly to the absence of political unity and autonomy within a state, and to the fact that peripheral areas within a state have at least as much in common with neighboring states as they do with the center and the other peripheral areas of their own state.

Marcio: Since we take the basis of the Castilian language to be Latin, it remains for us to say how it came about that in Spain are spoken the other four types of languages that are now spoken there, namely Catalan, Valencian, Portuguese, and Basque.

Valdés: Two things are usually the principal cause of diversity of languages in a province: one is that it is not entirely under one prince, king, or lord, whence it proceeds that there are as many differences of language as diversity of lords; the other is that, since something always links provinces bordering on one another, it comes to pass that each part of a province, taking something from the neighboring provinces, gradually becomes different from the others, not only in speech, but also in conversation and customs. Spain, as you know, has been under the rule of many lords . . . This diversity of lordships has I think in some manner caused the difference of languages, although each of them conforms more with the Castilian language than with any other; because, although each one of them has taken from its neighbors, as Catalonia has taken from France and Italy, and Valencia has taken from Catalonia, on the whole you see that principally they draw on Latin, which is, as I have said, the basis of the Castilian language . . . (Valdés, 1737/1965, pp. 47–9, my translation)

The belief that Castilian had undergone less outside influence than Catalan or Valencian made its “Spanishness” seem less diluted, and understandable by more Spaniards than any of the more “eccentric” vernaculars. Valdés goes on to eliminate Basque and Portuguese from the equation by polar opposed strategies: Basque, he says, is simply too far from the rest to be understood, while Portuguese is too close to Castilian (they were much more alike in Valdés’ time than today).

Valdés takes the center, protected from outside influences by its geographical position, to define the essence of the national character and its linguistic manifestations. But centers are relative. A Portuguese national language was brought into being after Portugal became a separate kingdom from Galicia in 1139, in large part by focusing on and exaggerating such differences from Castilian as could be found. Galicia itself was taken over by the Castilian monarchy in 1486, yet Galician, closer linguistically to Portuguese than to Castilian, continues to play an important role in Galician identity and movements for the restoration of independence. It has not been quite so dramatically successful as Catalan in this regard, probably because Galicia lacks the economic power of Catalonia and its capital Barcelona. The Catalan language also enjoys the status of official language of an independent state, Andorra, as well as being co-official in Catalonia itself, the Balearics, and Valencia.

The status of the Catalan language and its role as the principal language of education have been crucial to the nation’s claims for statehood in recent decades. Meanwhile, however, Valencians have been asserting their own independence from both Spain and Catalonia,

and, not surprisingly, pointing to the differences between Valencian and Catalan as evidence for their separate nationhood. For Basque separatists, the linguistic isolation of the Basque language from all those around it is, of course, of immeasurable importance.

India

The independence of India and Pakistan in 1947 was a watershed in the wrapping-up of the European overseas empires. There was historically little attempt to mythologize India as a nation-state, given its great linguistic, religious, ethnic, and cultural diversity from north to south, with no one people clearly forming a core of "real" Indians. It was Britain that unified the subcontinent, and when India took independent statehood, English was the only language that all educated Indians shared, and that had functioned in the modern administration of the country. As the ex-colonial language, however, it carried with it a symbolic value directly at odds with that of the nationalist ideal, without which the new state appeared doomed to fragment.

The movement to establish Hindi as the nation's official language "aroused the provincial nationalism of the non-Hindi language group; stirred deep regional, communal, and cultural divisions; and forced the reorganization of state boundaries to the accompaniment of vast civil violence running into tens of thousands of deaths" (Passin, 1968, p. 453). The passions that have given rise to this state of affairs are illustrated by the following quotations:

There is not a day to be lost. The Hindi noose is fast tightening round our necks. We have to act before the last breath is stifled. . . .

We have to carry on a vigorous, relentless, and countrywide propaganda for English. The message of English should be carried to every nook and corner of this land . . .

Never give in, Never give in! Never, Never, Never, Never . . .

The victory will be ours. (John, n.d., pp. 49–52)

The view of Mahatma Gandhi, while more pacific, was no less strongly held:

To think that English can become our national language is a sign of weakness and betrays ignorance.

Then which is the language which fulfills all the requirements to be the national standard? We shall have to admit that it is Hindi.

How can any Indian really be averse to Hindustani? . . .

Only that language which the people of a country will themselves adopt can become national. However virile the English language may be, it can never become the language of the masses of India. (Gandhi, 1956, pp. 4, 146)

The solution arrived at was to make English an "associate official" national language, a status just below that of Hindi, and to allow wide berth for the use of other Indian languages at the state and territorial level. Currently 22 languages have this "scheduled" status. It is a cumbersome solution, but the politics of India have been such that granting recognition to many constituent nations has been the only way of keeping them together within the state.

Ireland

The United Kingdom of Great Britain and Ireland was established on the first day of the 19th century, January 1, 1801. Scotland and England had been joined by an Act of Union

in 1707, while Wales had merged into a single jurisdiction with England in the 16th century, the same period in which the 60-year-long Tudor (re)conquest of Ireland was undertaken. Great Irish estates and plantations were granted to English settlers in much the same way as in the southern American colonies.

Already at the end of the 19th century, Home Rule for Ireland became the great *cause célèbre* for center-left belief in the nation-state throughout the UK and beyond. The lack of concern for the population shown by English landowners during the Irish famine of 1740–41 became a national narrative giving the cause a moral foundation. In terms of national identity, religion was a significant factor, the majority of the Irish—especially the poor—being Roman Catholic. Linguistically, however, English was the dominant language. In order to further the nation-state cause, the Irish middle classes began to cultivate the Irish Gaelic which their ancestors had mostly given up (see Crowley, 2005). A series of Home Rule acts culminating in the partition of North and South in 1921 did not end the political cause, particularly among Irish Catholics in Northern Ireland, which remained part of the UK.

The ideology of Gaelic as the one true language of all Ireland—or rather, Éire—was strong enough for the Republic to introduce the language as a compulsory school subject, despite it having a small secular literature and no tradition of use in scientific or humanistic study. By the 1960s the popularity of Irish as a school subject was on the wane, as the dream of a Gaelic-speaking socialist nation-state went the way of other modern utopias. Still, the use of Gaelic names for key government bodies such as the Oireachtas (parliament), and posts such as the Taoiseach (prime minister), continues to fulfill a powerful identity function.

Iroquois

The Haudenosaunee (Iroquois) is a confederation of six (originally five) American Indian nations whose traditional lands make up most of the present state of New York. The confederation has a constitution, the Gayanashagowa (Great Law of Peace), which is recorded on a wampum (shell bead) belt that is apparently more than four centuries old, with the text itself representing an oral tradition that may go back a further four to six centuries (see Favor, 2003). These carefully preserved sacred belts were produced as evidence to French and British colonial officials, and later to the American government, of the six nations' right to inhabit their lands freely. As a constitution, they are what give the multinational Iroquois confederation the status of a quasi-state.

The document declares that it is only language that makes a nation: "The Great Creator has made us of the one blood and of the same soil he made us and as only different tongues constitute different nations he established different hunting grounds and territories and made boundary lines between them." Yet there seems not to have been an attempt to create an Iroquois language from the related Mohawk, Oneida, Onondaga, Cayuga, Seneca, and (later) Tuscarora dialects spoken by the people who made up the quasi-state. It is striking how much of the Gayanashagowa consists of texts to be recited at particular rituals, including funerals and the start of battles but also ritual meetings of the nations' councils. In the following excerpt from the constitution, nothing is said about the nations' linguistic differences.

Should two sons of opposite sides of the council fire agree in a desire to hear the reciting of the laws of the Great Peace and so refresh their memories in the way ordained by the founder of the Confederacy, they shall notify Adodarho, [who], in conjunction with his cousin Lords, shall appoint one Lord who shall repeat the laws of the Great Peace . . .

At the ceremony of the installation of Lords if there is only one expert speaker and singer of the law and the Pacification Hymn to stand at the council fire, then when this speaker and singer has finished addressing one side of the fire he shall go to the opposite side and reply to his own speech and song. He shall thus act for both sides of the fire until the entire ceremony has been completed.

This suggests that, at the time the text was composed, the five nations' languages were mutually comprehensible, even if recognized as different tongues. In later centuries, when linguistic change had widened the gap, the sacred status of the Gayanashagowa may have made it impossible to question whether the languages of the various nations might require reunifying. It would however be naive to suppose that, if a common Iroquois language had been created following processes similar to those which produced the European national languages, it would have made a great difference to the subsequent loss of Iroquois land and autonomy.

Israel

The state of Israel began as a concept long before it became a reality. In Europe in the second half of the 19th century, Zionism was a cultural and political movement, and it was then that the "revival" of the Hebrew language began with regular exchanges and columns in Central European Jewish newspapers. The Sykes-Picot agreement of 1916, which planned for breaking up the Ottoman Empire and putting the Middle East under the control of Britain and France, made the dream seem realizable. But only the revelation of the full scale of Nazi genocide in 1945 brought consensus over the moral imperative for the founding of a Jewish nation-state. Ironically, the ideology behind this was that same belief in the natural right of a nation to occupy its own homeland that had driven the Nazi genocide.

Those who came to settle in Israel were immediately confronted with their vast cultural differences, including the lack of a common language. The project of reviving Modern Hebrew now became a political necessity—but in fact the idea that the modern language is the ancient one revived is part of the narrative establishing the cultural-psychological existence of a Jewish nation and its right to occupy this particular territory. In fact the grammatical structure of Ivrit (modern spoken Hebrew), which linguists take to define the "real" nature of a language, is very different from that of the ancient tongue, reflecting a creolization of the modern language's substrata, including spoken Palestinian Arabic, Yiddish, Judeo-Spanish, and a range of Slavic languages (see Zuckermann, 2003). In addition, the myth grew that the revival was the work of one scholar, Eliezer Ben-Yehuda, making what was a long and rather haphazard process appear rational and controlled. This gave Ivrit a claim to modernity, hence fitness to function in all spheres of life, including science, alongside the claims of its ancient authenticity.

Conclusion

The unanswerable question for now is whether national languages, together with the nations to which they are attached, represent a historical phase that is on a course of decline heading for eventual disappearance, or an invention that has proven too useful for human social organization to be given up. Pace Butler and Spivak (2010), it will be some time before analysts can assess the accuracy of the widespread belief that the restoration of globalization since the early 1990s is responsible for the reduction of loyalties to the state units fixed in the 19th and 20th centuries, in favor of regional or tribal loyalties. Considerable

evidence suggests that what has been happening should in fact be called “glocalization”—a term coined to denote the combination of globalization with the resurgence of local, subnational sites of belonging.

Languaging: Collaborative Dialogue as a Source of Second Language Learning

MERRILL SWAIN AND YUKO WATANABE

A theoretical claim is that languaging is a source of second language (L2) learning (Swain, 2006, 2010). The concept of languaging derives from Vygotsky's work which demonstrated the critical role language plays in mediating cognitive processes. Language and thought are not the same thing; in fact, Vygotsky argued that language "completes thought." In essence, we can think of languaging as an activity, a "process of making meaning and shaping knowledge and experience through language" (Swain, 2006, p. 98), and as such, it is part of the process of learning. The verb *languaging* forces us to understand language as a process rather than as an object.

When confronted with a complex problem, we may speak with another person about the problem and how to solve it (collaborative dialogue, interpersonal communication), or we may speak aloud or whisper to ourselves (private speech, intrapersonal communication). These are two types of languaging. Talking with (or writing to) others and talking with (or writing to) oneself are connected theoretically and in practice. As with any example of languaging, the goal is to solve a complex cognitive problem using language to mediate problem solution.

In this entry, we first define collaborative dialogue (a type of languaging). Following that, we discuss some of the research which suggests that collaborative dialogue is a source of L2 learning and development, and ways in which collaborative dialogue mediates L2 learning and development. This is followed by a discussion of studies which consider the impact context has on the quality and quantity of collaborative dialogue. We conclude with a statement of why collaborative dialogue is important to both learners and teachers of second or foreign languages. Our focus throughout this entry is on research concerning collaborative dialogue *between peers* in the area of second or foreign language education. We include studies that (a) explicitly use the term collaborative dialogue, or (b) provide data which we consider to be examples of collaborative dialogue although the researchers may label it differently.

Definition

Collaborative dialogue has been defined as dialogue in which speakers are engaged in problem solving and knowledge building (Swain, 2000). Collaborative dialogue may be about anything (e.g., mathematics, physics, language). During collaborative dialogue, one or both speakers may refine their knowledge or come to a new or deeper understanding of a phenomenon. Speakers (or writers) are using language as a cognitive tool to mediate their own thinking and that of others. Speaking produces an utterance, a product (an artifact) that can be questioned, added to, discredited, and so forth. This action of co-constructing meaning is collaborative dialogue, and is a source of language learning and development.

The example below is illustrative. In this example, two grade 8 French immersion students, Doug and Kathy (pseudonyms), are in the process of writing out a story based

2 LANGUAGE

on a set of pictures they have been given (see Swain & Lapkin, 1998, for details of the task). In the part of their dialogue provided below, they are working out how to write in French their intended meaning, “while she combs her hair and brushes her teeth,” to complete what they have already written, “*Yvonne se regarde dans le miroir . . .*” (“Yvonne looks at herself in the mirror . . .”). The translation of what Doug and Kathy say is in **bold**.

- 1 Kathy: Pendant qu'elle brosse les cheveux.
(**while she brushes her hair**)
- 2 Doug: Et les dents.
(**and her teeth**)
- 3 Kathy: Non, non, pendant qu'elle brosse les dents et . . .
(**No, no, while she brushes her teeth and . . .**)
- 4 Doug: Elle se brosse . . . elle SE brosse.
(**She brushes . . . she brushes [emphasizes the reflexive pronoun]**)
- 5 Kathy: Pendant qu'elle se brosse les dents et peigne les cheveux.
(**While she brushes her teeth and combs her hair**)
- 6 Doug: Ya!
- 7 Kathy: Pendant qu'elle . . . se brosse . . . les cheveux, I mean, no, pendant qu'elle se PEIGNE les cheveux.
(**While she . . . brushes . . . her hair, I mean, no, while she COMBS her hair**)
- 8 Doug: Ya.
- 9 Kathy: Et se brosse . . .
(**And brushes . . .**)
- 10 Doug: Les dents.
(**Her teeth.**)
- 11 Kathy: Pendant qu'elle SE peigne les cheveux et SE brosse les dents.
(**While she combs her hair and brushes her teeth [emphasizes the reflexive pronouns]**)
(from Swain, 2000)

In this example, we see Kathy and Doug co-constructing the second half of the sentence. They end up with the complex and correct structure “*pendant qu'elle se peigne les cheveux et se brosse les dents*” (“while she combs her hair and brushes her teeth”). To do so, they had to consider which verb goes with which noun, and the reflexive nature of the particular verbs they were using. Kathy started off with “*brosse les cheveux*,” a phrase that directly translates the English “brushes” and “hair.” Doug’s offer of “*et les dents*” (“and her teeth”) in turn 2, however, triggered Kathy to reject her verb/noun collocation of “*brosse/cheveux*” and replace it with the more usual collocation of “*brosse/dents*” (turn 3). Doug quickly reacted to Kathy’s use of “*brosse*” in turn 3 by pointing out through emphasis in turn 4 that “*brosse*” is a reflexive verb: “*elle SE brosse*.” Kathy incorporated this information in turn 5 for “*brosse*” and generalized it (correctly) to “*peigne*” in turn 7 although her focus in turn 7 was on using the verb that best accompanied “*les cheveux*.” In turn 9, with Doug’s encouragement, she continued with “*et se brosse*,” then hesitated. Doug again provided her with the appropriate noun “*les dents*.” In turn 11, Kathy shifted her focus to the form of the verbs as reflexives, thus fully incorporating Doug’s contributions to this conversation.

The dialogue between Kathy and Doug represents “collective cognitive activity which serves as a transitional mechanism from the social to internal planes of psychological functioning” (Donato, 1988, p. 8). Through it, they regulated each other’s mental (and affective) activity, and their own. Their dialogue provided them with opportunities to co-construct a complex linguistic structure by focusing their attention and providing opportunities to revise their own language use.

Collaborative Dialogue as a Source of Learning

A number of studies have suggested that peer–peer collaborative dialogue is *a source* of L2 learning. Donato’s (1994) pioneering study examined the collaborative dialogue of three university learners as they jointly constructed a scenario to be performed in French, the foreign language they were studying. The analysis of the collaborative dialogue revealed that the three learners, regardless of their linguistic abilities, provided mutual support to each other in order to solve the linguistic problems that they encountered, much as Kathy and Doug did in the example above. Some of the forms that the students collaboratively constructed were successfully reused after their interaction when they role-played the scenario. Donato’s study demonstrated that although the students were individually novices, collectively they were experts who created linguistic forms that none of them could have created on their own.

Swain and her colleagues have shown how peer–peer interaction provides L2 learners with an opportunity to engage in collaborative dialogue as they seek out and provide assistance with language-related problems (e.g., Swain & Lapkin, 2002; Watanabe & Swain, 2007; Brooks & Swain, 2009). These studies used language-related episodes (LREs) as a unit of analysis to operationalize the construct of collaborative dialogue. Swain and Lapkin (1998) defined LREs as “any part of a dialogue where the students talk about the language they are producing, question their language use, or correct themselves or others” (p. 326). In other words, through collaborative dialogues, students form and test hypotheses about appropriate and correct use of language, as well as reflect on their language use. By using posttests tailor-made to the LREs produced by each pair of students, it is possible to trace the L2 learning that occurred during the LRE. Thus an LRE is a useful unit for understanding the process and product of L2 learning. In effect, LREs represent L2 learning in progress.

Other research has explored whether peer–peer collaborative dialogue is more effective in learning vocabulary and grammar than working alone. When the solitary condition involves the use of private speech (versus think-alouds, which do not necessarily serve the same mediating function as private speech), the two conditions appear to produce comparable results. For example, Borer (2007) explored the effect on learning L2 vocabulary of languaging in the form of collaborative dialogue and private speech. She examined eight English for academic purposes (EAP) students who were learning five unknown words when working alone and five different unknown words when working in pairs. Borer found that individual and pair conditions were equally effective. Other research examining whether collaborative dialogue is more effective than private speech in learning vocabulary (Kim, 2008) and L2 grammar in writing (Storch & Wigglesworth, 2007) found the results favored the pair condition.

Mediational Means Used During Collaborative Dialogue

Research has examined the use of different mediational means during collaborative dialogue. These mediational tools include scaffolding, the use of the L1, and repetition.

Scaffolding

The concept of scaffolding (Wood, Bruner, & Ross, 1976), the process by which an adult assists a child to complete a task beyond the child’s actual developmental level, initially referred to adult–child interaction only. However, researchers who applied the notion of scaffolding to peer interaction demonstrated that peers can simultaneously be experts and novices and thus are able to provide scaffolded assistance to each other (e.g., Donato, 1994; Ohta, 2000). These studies have contributed to the extension of the concept of scaffolding

from the unidirectional help of the expert to the novice to an opportunity for learning and development for all learners.

For example, Villamil and de Guerrero (1998) examined the collaborative dialogue that occurred during two peer writing revision sessions carried out by seven pairs of adult learners of English. The data indicate that a large majority of modifications (74%) discussed during peer revisions were incorporated into the final drafts. The researchers also found evidence of development in the learners' shift from other-regulation to self-regulation while engaging in collaborative dialogue.

Use of L1

Use of the L1 in L2 classrooms is a controversial issue. Sociocultural theorists argue that L1 has a place in the second language classroom because it is a cognitive tool essential to make sense of the L2 learning process. Antón and DiCamilla (1998) investigated the socio-cognitive functions of L1 use in the collaborative dialogue of adults learning Spanish as an L2. Qualitative analysis of five dyads working collaboratively on writing tasks demonstrated how the L1 mediated intersubjectivity and externalization of inner speech (i.e., private speech) during cognitively difficult activities.

In their examination of the collaborative dialogue between university ESL students as they engaged in peer revision of their L2 writing, Villamil and de Guerrero (1996) found that the learners used their L1 to make meaning of text, solve language-related problems, generate ideas, gain control of the task, and maintain dialogue. Villamil and de Guerrero's study underscored the importance of the L1 as an essential cognitive tool for the learners' collaborative problem solving.

Repetition

DiCamilla and Antón (1997) examined the use of repetition to mediate solutions to language-related problems. The participants in their study were adult L2 Spanish learners engaged in collaborative writing tasks. DiCamilla and Antón concluded that in peer-peer collaborative dialogue, repetition functioned to create and maintain learners' shared perspective of the task and mediated the co-construction of linguistic knowledge.

Contexts Implicated in the Quality and Quantity of Collaborative Dialogue

Recent studies on collaborative dialogue have focused on how aspects of the context affect the quality and quantity of collaborative dialogue. The research to date has examined patterns of pair interaction (e.g., Storch, 2002), the level of L2 proficiency (e.g., Leiser, 2004; Kim & McDonough, 2008; Watanabe, 2008), type of tasks (e.g., Swain & Lapkin, 2001; de la Colina & Garcia Mayo, 2007), and computer-mediated communication (CMC) (e.g., McDonough & Sunitham, 2009; Zeng & Takatsuka, 2009).

Patterns of Pair Interaction

Storch (2002), in her study of collaborative tasks in an adult ESL classroom, uncovered four different patterns of pair interaction that influenced the degree of collaboration and opportunities for learning. In the collaborative pattern, both learners work together throughout the task completion process and are willing to share ideas with each other. In dominant/dominant pairs, there is an unwillingness or incapacity to engage with each other's contribution. Dominant/passive pairs involve a dominant participant with an authoritarian stance who takes control of the task, and a passive partner who maintains a subservient

role. In expert/novice pairs, the more knowledgeable learner (expert) actively encourages the less knowledgeable learner (novice) to engage in the task. Storch found that the pairs with a collaborative orientation (collaborative and expert/novice) afforded more opportunities for learning than the pairs with a non-collaborative orientation (dominant/dominant and dominant/passive). Using Storch's (2002) framework, Watanabe and Swain (2007) proposed an additional pattern of interaction (expert/passive), indicating a need for further study in this area.

Proficiency Differences

Kowal and Swain (1997) documented that in a highly heterogeneous grouping (e.g., upper-middle and low), the stronger student tended to carry out most of the work either because the weaker student was too intimidated to say anything, or was willing to let the stronger student do the task, or was not allowed to do any of the task whether their opinion was valid or not. A successful support framework for group members requires respect for one another's perspectives and trust in each other's opinions. This may be difficult to achieve when proficiency differences are too large.

Leeser (2004) focused on the impact of learner proficiency on collaborative dialogue in an adult L2 Spanish class as they engaged in a dictogloss task. Leeser analyzed the frequency, type (i.e., lexical or grammar-based) and outcomes of LREs (i.e., problem solved correctly, not solved, or solved incorrectly) produced by three different groupings of learners: high-high, high-low, and low-low. Leeser found that as the overall proficiency of a pair increased, the learners produced a greater number of LREs, correctly resolved more LREs, and focused more on form than on lexical items.

Watanabe (2008) and Watanabe and Swain (2007) investigated how four adult ESL learners each interacted with both more and less proficient peers and how their interaction affected the nature of collaborative dialogue and L2 learning. The analysis of the collaborative dialogue and patterns of pair interaction as well as pre- and posttest scores suggested that the patterns of pair interaction greatly influenced the frequency of LREs and posttest performance. When the learners engaged in collaborative patterns of interaction, they were more likely to achieve higher posttest scores regardless of their partner's proficiency level. The researchers thus claimed that proficiency differences did not seem to be the decisive factor in affecting the nature of collaborative dialogue. Rather, the pattern of interaction co-constructed by both learners had a greater impact (see also Kim & McDonough, 2008).

Type of Task

Researchers have also explored whether the type of task affects the quality and quantity of collaborative dialogue (e.g., Swain & Lapkin, 2001; de la Colina & García Mayo, 2007). Swain and Lapkin (2001) examined how different task types (jigsaw and dictogloss) encouraged form-focused LREs of grade 8 French immersion students in two different classes. The students in one class engaged in a jigsaw task while the students in the other class completed a dictogloss task. No significant differences were found between form-focused LREs generated by the two different tasks (see also de la Colina & García Mayo, 2007). Both tasks generated a comparable and substantial proportion of form-focused LREs. The most salient difference was that the dictogloss imposed a smaller range in the total number of LREs produced by the students relative to the jigsaw task.

Computer-Mediated Communication (CMC)

CMC is a relatively new interaction context that has begun to be investigated. Studies have explored the role of peer-peer (face-to-face) collaborative dialogue at the computer (e.g.,

McDonough & Sunitham, 2009) and text-based (online) collaborative dialogue (e.g., Zeng & Takatsuka, 2009).

McDonough and Sunitham (2009) investigated whether Thai EFL learners reflect on and remember language forms during computer-mediated collaborative tasks in a self-access environment. The analysis of LREs and tailor-made tests of 48 Thai EFL learners indicate that they successfully resolved the majority of their LREs in collaboration with their peer. However, it was found that learners remembered only one-third of the grammatical forms and less than half of the lexical items that they had discussed. The authors speculated that because the computer activities were not connected or reinforced during class time, the learners might have had little motivation to remember the language items.

Zeng and Takatsuka (2009) examined the collaborative dialogue between Chinese EFL learners as they carried out collaborative tasks in a CMC context using online chat. The researchers found that the learners provided assistance to each other in attending to language forms, which promoted metalinguistic awareness. The analysis of LREs showed that the students produced a high frequency of LREs and successfully resolved most (90%) of the emerging language problems. The results of two tailor-made posttests suggested that collaborative dialogue was a source of L2 learning.

Conclusion

The studies we have discussed indicate how languaging as collaborative dialogue is a source of L2 learning. Analyses of learners' collaborative dialogues have shown how L2 learners use language as a cognitive tool to mediate their thinking, and how talking about the language mediates L2 learning and development. Evidence that collaborative dialogue is a source of L2 learning is based on tracing relationships between collaborative dialogue as process and product, and tailor-made posttests. Still under-researched is whether collaborative dialogue mediates the learning of L2 reading and listening, and L2 pragmatics. Also worthy of exploration is how the presence of specific artifacts such as textbooks affects the quality and quantity of collaborative dialogue. The importance of collaborative dialogue to teachers and learners of second or foreign languages is that by listening to it, insights into the cognitive and affective processes that learners are using in their particular learning/teaching context are inevitable.

Lantolf, James P.

DERYN P. VERITY

James P. Lantolf (1947–) is the scholar whose name is most closely associated with the development of the Vygotskian, or sociocultural (SCT), paradigm of second language acquisition research. He is currently the Greer Professor in Language Acquisition and Applied Linguistics in the Department of Applied Linguistics at The Pennsylvania State University, director of the Center for Language Acquisition, and codirector of CALPER (Center for Advanced Language Proficiency Education and Research).

Lantolf's work over the past three decades has been to explore the ideas of Lev Vygotsky and other Russian writers such as Luria, Leontiev, Galperin and others, and to apply them to the central questions of SLA. The success of his efforts has resulted in a radical shift in the locus of our attention and understanding: where once learners were assumed to be isolated individuals who "process input," the field now recognizes that learners are socially and culturally situated agents who appropriate language and meanings through mediated activity (i.e., through using language and other sign systems and tools). It is thanks to James Lantolf that students of SLA are now routinely introduced to such concepts as the zone of proximal development (ZPD), mediation, scaffolding, and self-regulation.

Lantolf, who started out as a scholar of Spanish linguistics, was invited to join the new linguistics program at the University of Delaware in 1980. There he was introduced to the ideas of Vygotsky by colleague William J. Frawley. Over the next decade, several iconoclastic articles appeared (e.g., Frawley & Lantolf, 1984; Frawley & Lantolf, 1985; Lantolf & Frawley, 1988) which criticized the information-processing and "conduit" metaphors that informed SLA research at the time. These papers reconceptualized familiar topics such as L2 speaking, proficiency testing, and second language discourse in terms of Vygotskian theory, that is, as examples of goal-oriented activity with a complex, and not necessarily transparent, internal structure.

During these early years, this new way of looking at language, acquisition, and learners was quite unfamiliar and sparked resistance from researchers committed to what Lantolf considered the overly reductionist focus of mainstream SLA thought. Critics found SCT irrelevant, or criticized it for being relativistic and extreme. Lantolf's commitment to challenging orthodoxy in SLA discourse has remained firm: as he said once in a response to a critic, "It is the responsibility of the field to interrogate its own practices from within" (Lantolf, 2002, p. 77).

To counteract the lack of familiarity that even willing audiences brought to his discussions, Lantolf regularly included introductory remarks on Vygotsky's life and work in every article. To review his writings from the 1980s and early 1990s is to obtain an abbreviated but insightful education in the three basic tenets of the SCT paradigm of SLA: (a) *the social origin of cognition*—thinking has its source in the sociocultural world created by purposeful human activity; (b) *language as primary semiotic system*—all interaction with the world is not direct but mediated, that is, language both shapes, and is shaped by, our social and cultural circumstances; and (c) *the importance of the genetic heuristic*—end results are opaque: to truly understand something, we must lay bare the history, or genesis, of its development.

Nevertheless, SCT remained on the fringes of SLA discourse for some time. Even after a decade of work, Lantolf felt compelled to include a good measure of biographical and

explanatory information about Vygotsky's life and work in the foreword to his first book of collected research essays on SCT (Lantolf & Appel, 1994). Still, the year 1994 marked an important milestone. Not only was the book published, exploring motivation, collective scaffolding, inner speech, and other topics that could be understood "more fully" by seeing them through a Vygotskian lens (Lantolf & Appel, 1994, p. 27), but Lantolf also served as guest editor for a special issue of *The Modern Language Journal* entitled "Sociocultural Theory and Second Language Learning" (Lantolf, 1994). These two publications brought a critical mass of SCT scholarship to the attention of a wide readership.

Lantolf moved in 1991 to the Linguistics Department at Cornell University. His tenure there included coeditorship of the journal *Applied Linguistics* for five years, and the establishment in 1993 of the Sociocultural Theory Second Language Learning Working Group, which continues to hold regular annual seminars.

In 1999, Lantolf was invited to The Pennsylvania State University to become the first director of the new Center for Language Acquisition. Familiarity with SCT among mainstream SLA researchers was exponentially greater by the time that Lantolf moved to Penn State than it had been only a few years earlier. This was due not only to Lantolf's own efforts, but also to the growing centrality of SCT ideas in the work of highly regarded scholars such as Merrill Swain, whose research was progressively more shaped by SCT as she moved from the output hypothesis to languaging; Rick Donato, whose studies of collaboration and pedagogy were grounded in SCT; and Steve McCafferty, whose work in gesture and cognition reflected Lantolf's growing sense that activity theory constituted not just a theory of learning, but a theory of mind (Lantolf, 2000, p. 80).

This growing body of work was reflected in a second edited volume that appeared in 2000 (Lantolf, 2000). Core SLA concepts, including internalization, agency, relativity, identity, and interaction are discussed from a SCT perspective. Introductory matter focuses on Vygotsky as theorist rather than on the historical life and times of the man. Lantolf characterizes the volume as current scholarship in activity theory, a "unified account of Vygotsky's original proposals" (2000, p. 8). The book marked a turning point for SCT in the mainstream; it is perhaps the most widely read of all Lantolf's books and has become a standard text in graduate programs worldwide.

At Pennsylvania State Lantolf contributed to establishing a new department in applied linguistics. Besides holding the presidency of the American Association for Applied Linguistics (AAAL) from 2004 to 2005, and convening a well-received Summer Institute in Applied Linguistics which attracts leading applied linguistics scholars as guest faculty, he was instrumental in establishing CALPER, a government-funded National Foreign Language Resource Center which focuses on the development of materials and methodologies for promoting advanced proficiency in languages other than English (<http://calper.la.psu.edu>).

In recent years, two more collaborative volumes have appeared. Lantolf and Thorne (2006) represents a new stage in the identity of SCT, one in which the authors no longer need to introduce the theory and its constructs, but rather have the relative luxury of situating them within the history of theories of mental development. The authors even see a need to reclaim their sense of the term "sociocultural," because, as they point out, it has become widely used among "multiple research communities" (p. 2). A dense, but engaging, meditation upon the basic concepts of SCT—mediation, internalization, the ZPD—the book profoundly enlarges the scope of Vygotskian thinking in SLA. The authors, seeking to remove some of the encrustations of casual, inaccurate usage of several SCT terms, name cognitive linguistics as a particularly useful "partner" for SCT because it brings "culturally organized meaning . . . to center stage" (p. 5). Lantolf cites cognitive linguistics and languaculture (Agar, 1994) to enrich his growing belief that metaphor underlies all human semiotic activity (Lantolf, 2002, p. 76).

A coedited volume on SCT and teaching (Lantolf & Poehner, 2008) presents several ideas on how SCT can inform foreign language pedagogy. Reflecting CALPER's commitment to exploring and developing revolutionary pedagogies, the book contains several examples of dynamic assessment, a pedagogical approach in which instruction and evaluation are inextricably enmeshed. Underlying the variety of pedagogical topics is the unifying notion of the *dialectic*, the productive tension caused by the interdependence of opposites, such as teaching and learning, or testing and instruction. Current projects in 2010 include another book, with Poehner, exploring the concept of praxis (the dialectic of theory and practice) in second language teaching.

Lantolf's contribution to our understanding and appreciation of the ideas of Vygotsky and the sociocultural perspective cannot be overstated. His work has deepened our understanding of how human activity is crucially semiotic. As a person, he takes daily joy in the pleasures of family, food, and friendship; as a scholar, he embraces radical originality and collaborative production. His robust and abiding engagement with the professional community in all its parts is perhaps the most persuasive argument we can muster to support the central Vygotskian claim: without the presence, and help, of others, we do not become ourselves.

Large-Sized Language Classes

RICHARD WATSON TODD

Large-sized language classes are a cause for concern for many language teachers, with most teachers regularly teaching classes of a size larger than what they perceive as ideal (Coleman, 1989a). These perceptions of how many students constitute a large-sized language class can vary greatly from teacher to teacher, but generally language teachers believe that large class sizes can cause many problems in teaching and learning, and so a wide range of suggestions for dealing with the perceived problems have been suggested. However, research into what happens in large classes suggests that the actual problems are less serious than teachers believe.

The research literature into large classes falls into five categories. By far the most common type investigates teachers' perceptions and beliefs about class size and the problems of teaching in a large class, mostly through questionnaire surveys. Far less common are investigations of the perceptions and beliefs of other stakeholders, such as students and administrators. Studies of the classroom discourse and interaction of large classes in comparison to smaller classes are also rare. Another category is reports of interventions aimed at solving the perceived problems of large classes, most of which take the form of descriptions of teaching techniques and activities with anecdotal evidence for their effectiveness. Finally, there are studies of the relationship between class size and actual learning.

Surveys of language teachers concerning the threshold number of students beyond which a class is considered large have produced figures ranging from 30 to 150 (Xu, 2001). These numbers are closely related to the size of classes that teachers typically encounter (Coleman, 1989a), although a number of other factors also influence perceptions of class size. The threshold class size of large classes for teaching complex skills, higher-order thinking, and speaking skills is generally lower than for, say, teaching factual knowledge and reading (LoCastro, 1989; Obanya, Shabini & Okebukola, *n.d.*). Also, thresholds for large classes are usually lower for teachers than for students (Instructional Development USCB, 2008).

Large-sized language classes are an important issue because teachers believe that large class sizes are behind many of the problems they face. Most studies of large-sized language classes report the potential problems perceived by teachers (e.g., LoCastro, 1989; Peachey, 1989), and these fall into five main categories. First, a large number of students in a class can lead to classroom management and discipline problems. Second, if the room is not designed for the size of the class, physical problems may ensue, such as student discomfort, students not being able to see, and excessive noise. Third, large classes may have an impact on affective issues by making it difficult for the teacher to achieve rapport with students and by making the class less personalized as the teacher has trouble remembering student names. Fourth, concerning interaction, with more students in a class each student may have fewer opportunities to contribute and so will receive less attention from the teacher. Fifth, there can be problems of feedback and evaluation as monitoring of individual students is reduced, less personalized feedback is given, and marking loads are a burden for teachers. These last two issues have led teachers' organizations such as the Conference on College Composition and Communication to produce position statements arguing that maximum class sizes for teaching second language writers should be 15 (CCCC, 2009).

The severity of these problems as perceived by teachers has led to numerous suggestions for solving them (e.g., Sarwar, 2001; MacDonald, Thiravithul, Butkulwong, & Kednoi, 2002),

2 LARGE-SIZED LANGUAGE CLASSES

including using routines to improve discipline, using project work and cooperative learning to provide more opportunities for students to contribute, using name cards to help in learning student names, and using self and peer assessment to reduce marking load.

The emphasis on problems in the large-classes literature may reflect teachers' perceptions more than reality. In a diary study of a teacher teaching a class of 84 students (Boonmoh, 2005), the teacher initially had very negative expectations but ended the course feeling positive about the experience. Furthermore, the research that has compared what happens in large and small classes has shown that actual differences are minimal. For instance, in Watson Todd (2006a) two different-sized classes of similar students following the same course and taught by the same teacher were compared. The findings show no differences between the classes for teacher talking time, use of the first language, types of questions used, types of feedback given, and frequency of disciplinary directives. The points where a clear difference was seen were restricted to use of student names and impersonality of directives.

Whether large-sized language classes are prejudicial to learning is debatable. The long lists of potential problems in large classes suggest that class size may have an impact on learning opportunities, leading some authors to claim that large classes result in less effective learning (Coleman, 1989b; Ur, 1996). From a more theoretical perspective, LoCastro (2001) argues that, based on language learning theories that stress the importance of production, large class sizes should have detrimental effects. However, in contrast to mainstream education where major research projects have shown the benefits of smaller classes (e.g., Finn & Achilles, 1999), there is a lack of research evidence showing that large-sized language classes are prejudicial to learning (Allwright, 1989), perhaps because other factors such as quality of teaching (Obanya et al., *n.d.*) and the kinds of activities used (Kumar, 1992) have a greater influence on learning than class size. Indeed, there may actually be benefits from studying in large-sized language classes (Coleman, 1989a), including increased anonymity, more friends, and, from an administrative perspective, greater efficiency. In spite of these potential benefits and the paucity of evidence for real problems in large classes, the fact that many teachers believe that large class sizes cause problems in language teaching, together with the influence of beliefs on behavior and the prevalence of large-sized classes throughout the world, means that large-sized classes are a major cause for concern in language education.

Larsen-Freeman, Diane

ELKA TODEVA

Diane Larsen-Freeman is Professor of Education and Linguistics, Research Scientist at the English Language Institute, and Faculty Associate at the Center for the Study of Complex Systems at the University of Michigan, Ann Arbor. She is also a Distinguished Senior Faculty Fellow at the SIT Graduate Institute in Brattleboro, Vermont. In recognition of her achievements as an applied linguist, language educator, and public intellectual, in 1997 Dr. Larsen-Freeman was inducted into the Vermont Academy of Arts and Sciences. She received a lifetime achievement award from Heinle/Cengage Publishers in 2000 and was awarded a Fulbright Distinguished Chair at the University of Innsbruck, Austria in 2009. In 2009, she was made *doctor honoris causa* of the Hellenic American University in Athens, Greece, and in 2011, she received the American Association for Applied Linguistics' Distinguished Scholarship and Service Award.

Diane Larsen-Freeman has been prolific throughout her career. She has authored 10 books and over 120 articles and book chapters, participated in Webcasts and Web dialogues, and delivered over 150 plenary addresses and invited presentations in 70 countries. This biographical entry has tried to capture her growth and professional contributions by using a key concept from her book *Complex Systems and Applied Linguistics* (with Lynne Cameron, 2008): Throughout one's life, a person tends to actively select and influence the contexts in which she functions, whereas contexts in their turn help shape the person's abilities and characteristics (after van Geert & Steenbeek, 2008).

Born in New York City, Larsen-Freeman received a bachelor's degree *cum laude* from the State University of New York at Oswego. There, she majored in psychology, studying theories of learning. Her general interest in human learning became refined to a specific interest in the learning of languages as a result of her work as a Peace Corps volunteer teaching English in Malaysia in the late 1960s. To learn more about language acquisition, she entered graduate school at the University of Michigan, earning both an MA and a PhD in linguistics. Her first professorial appointment was in the English Department (ESL section) at the University of California, Los Angeles (1975–8), where her productive collaboration with Marianne Celce-Murcia began. Later, she and her family moved to Vermont, where between 1978 and 2002 she taught in the Department of Language Teacher Education at the School for International Training, recently renamed the SIT Graduate Institute. Her tenure there was marked by a deepening understanding of the complexities and power of language teaching, achieved through intense exploration of teaching with her students and colleagues. In 2002, she left her SIT position as interim dean, returning to the University of Michigan to direct its English Language Institute.

In the early 1970s, Larsen-Freeman was one of a handful of young scholars who came together around their common interest in second language learning. Her first publications, reporting a correlation between a morpheme's frequency and its rank in the morpheme accuracy order, were based on her dissertation research on the morpheme acquisition order of adult second language learners. These publications, along with the contributions of others, helped expand attention beyond teaching to learning, launching the study of what later came to be called the field of second language acquisition. Her morpheme acquisition research and her work constructing a second language acquisition index of development are regarded by many as seminal for that emergent field.

Larsen-Freeman has been described as a revolutionary thinker. Along these lines, one of her most recent contributions introduced complexity theory to applied linguistics. In complexity theory fashion, Larsen-Freeman has both shaped and has been shaped by the field of SLA. By building cross-disciplinary bridges, SLA researchers and language practitioners have moved beyond the metaphor of “language acquisition” and have put center stage the metaphor of “participation” and of “becoming- and being-in-language” (Sfard, 1998). Larsen-Freeman has long challenged what she considers to be false dichotomies. A publication which makes this point particularly forcefully is her 2002 article arguing for the interconnectedness between language acquisition and use, part of a groundbreaking volume edited by Claire Kramsch called *Language Acquisition and Language Socialization: Ecological Perspectives* (Kramsch, 2002).

Influenced by Evelyn Hatch, Larsen-Freeman insisted that in order to capture the dynamic nature and social dimensions of language we needed to go beyond the sentential level of language and understand the organization and development of discourse. Her 1977 publication *A Rationale for Discourse Analysis in Second Language Acquisition Research* is one of the earliest works in this area, followed by her edited book *Discourse Analysis in Second Language Research* (1980).

Worth special mention is Larsen-Freeman’s reconceptualization of grammar as a key meaning-making and identity negotiation tool that is best viewed three dimensionally using her form/meaning/use framework. She also introduced dynamism into grammar, coining the term “grammaring” to mean the ability to use grammar structures accurately, meaningfully, and appropriately. To this end, she made the case for students not only learning the usual binary of form and meaning, but also the need for them to learn use—when and why a particular structure is used. This notion has many of the characteristics of an ecological approach to language education where grammar and its acquisition are firmly grounded in context and where learners are engaged in explorations that are not only emotionally and cognitively engaging but have social significance and personal meaning for them. She argued that in order to overcome the inert knowledge problem, students must be taught grammar as a fifth skill, using psychologically authentic activities to ensure transfer-appropriate processing.

Larsen-Freeman continued to argue for teaching grammar even when it was unpopular to do so. Ever the teacher, Larsen-Freeman frequently adopts and defends the middle ground between extreme views. Among her major publications that helped the field move away from counterproductive extreme positions regarding grammar are her *Teaching Language: From Grammar to Grammaring* (Larsen-Freeman, 2003), the authoritative *The Grammar Book: An ESL/EFL teacher’s course* (with M. Celce-Murcia, 1999, the third edition is in preparation), and her *Grammar Dimensions: Form, Meaning, and Use* series, in its fourth edition (2007).

Having witnessed first-hand their value in the teacher education program at SIT, Larsen-Freeman has also maintained her conviction in the value of introducing teachers to language teaching methods, despite the critiques methods have received. She believes that methods should not be imposed on teachers; rather they are valuable in teacher education because they help teachers bring to conscious awareness the thinking that underlies their actions. Through this awareness, teachers can choose to teach differently from the way they were taught.

Because of the versatility and breadth of her research interests and her ability to see complex patterns and synthesize emerging new ideas, Larsen-Freeman is often invited to write state-of-the-art chapters or articles (e.g., “The What of Second Language Acquisition” [1982], “Second Language Acquisition Research: Staking out the Territory” [1991], “Chaos/Complexity Science and Second Language Acquisition” [1997]) or to present “bigger

picture" views as a panel discussant and commentator at international conferences. Also worth mention here is her 1991 book, *An Introduction to Second Language Acquisition Research*, coauthored with Michael Long, considered a classic synthesis contributing to the intellectual evolution of the then still young field of second language acquisition.

Larsen-Freeman's coauthored book with Lynne Cameron, *Complex Systems and Applied Linguistics*, winner of the Modern Language Association's Kenneth W. Mildenberger book prize for 2009, is triggering a paradigm shift in the field of applied linguistics, inviting an unprecedented multidimensionality of thinking. It fundamentally challenges both our extant theories and the way we go about conducting research as applied linguists. The book's basic premise is that one can understand language use, evolution and change, and language acquisition as resulting from the same dynamic process operating at different timescales. The book also outlines areas of new exploration such as computational modeling of dynamic systems of language. Her recent collaboration with Nick Ellis has advanced these ideas under the guise of emergentism (Ellis & Larsen-Freeman, 2006, 2009).

The ideas presented in *Complex Systems and Applied Linguistics* have been in our discursive space for some time now, in no small part due to Larsen-Freeman's publications and presentations on complex dynamic systems over the last 10 years, beginning with her widely cited 1997 article in the journal *Applied Linguistics*. Her articles, workshops, seminars, and panel discussions have been groundbreaking and continue to shape and influence many careers and research agendas. Larsen-Freeman manages to sustain interest in the new trends and directions in applied linguistics by revealing previously underappreciated or underexplored interconnectivities.

A contagiously passionate teacher, Larsen-Freeman remains fascinated with the intricate complexities of language learning and teaching; this has helped her stay away from simplistic models and reductionist explanations. She has genuine respect for the learner and emphasizes intentionality, agency, and the importance of emic perspectives, that is, the views of the learner on the multitude of cognitive and social factors that shape the development of one's languages. For instance, she has long maintained (Larsen-Freeman, 1983a) that learners are not passive recipients of modified input, but rather active participants in a process of coadaptation. She has an equal respect for language teachers and their locally constructed knowledge. Her belief in the potential of teachers as reflective practitioners triggered her writings on the important distinction between teacher education and teacher training (1983b). It is that same respect and interest in the ideas and growth of others that made her define for herself the role of educator during her tenure as editor of the journal *Language Learning*, where she initiated a number of new practices, among them having authors receive extensive feedback on their manuscripts even when their contributions were not accepted.

As someone who always finds time for a sociable yet intellectually stimulating chat with her students and colleagues, Diane Larsen-Freeman has touched and transformed many people. She would be the first to say that these conversations have transformed and enriched her as well. This two-way enrichment, among other things, can be viewed as linguistics *bien appliquée*.

Learner Corpora

SYLVIANE GRANGER

Learner corpora are electronic collections of language data produced by L2 learners, that is, second or foreign-language learners. This relatively new resource is of great relevance for both second language acquisition (SLA) research and foreign-language teaching (FLT). One of the main characteristics of learner corpus research is that it makes full use of corpus linguistic methods and tools to understand the process of language acquisition, describe L2 learner language varieties, and design pedagogical tools that target learners' attested difficulties. The first learner corpus collections, which date back to the 1980s, only targeted English data. Since then, the field has expanded considerably and now includes learner data in a large number of languages.

Learner Corpus Design Criteria

Learner corpus data have the following distinguishing characteristics: (a) they are in electronic format; (b) they have been compiled on the basis of strict design criteria, pertaining to the learner (age, gender, mother tongue background, etc.) and the task (medium, topic, or timing); (c) they contain continuous discourse rather than decontextualized words, phrases or sentences; (d) they include data of the most open-ended type, which range from fully natural in the case of learners' communications with native speakers or other learners as they "go[ing] about their normal business" (Sinclair, 1996, p. 7), to semi-natural, that is, resulting from pedagogical tasks that allow learners to choose their own wording rather than being requested to produce a particular word or structure. This fourth characteristic is undoubtedly the fuzziest, as there are many degrees of naturalness. This has led Nesselhauf (2004, p. 128) to distinguish between prototypical learner corpora, which display all the defining characteristics of learner corpora (e.g., argumentative essays or informal interviews), from peripheral learner corpora, which only partly fill these criteria (e.g., summaries or picture descriptions). Although elicitation data such as gap-fill or grammaticality judgment tests do not qualify as learner corpus data, recent research has shown that corpus and elicitation data are most usefully considered not as conflicting but as complementary sources, highlighting as they do different facets of language acquisition (see Gilquin, 2007).

Learner language is obviously highly heterogeneous: there are many types of learners and learning situations, and "mixed bag" collections of L2 data present little interest. It is therefore essential to adopt strict design criteria when collecting learner data, a principle which underpinned the compilation of one of the most-used learner corpora of English, the International Corpus of Learner English (ICLE), which contains over 6,000 texts written by learners from 16 different mother tongue backgrounds and records 21 variables for each of the texts it contains. All the variables have been stored in a database and can be used by researchers as queries to compile their own tailor-made subcorpora and perform linguistic searches (Granger, Dagneaux, Meunier, & Paquot, 2009).

Learner Corpus Typology

Learner corpora can be categorized along several dimensions, among them the following three: the scope of the data collection, the time(s) of the data collection, and the medium of the language data.

Generic Versus Local

Learner corpora can be generic or local. Generic learner corpora aim to be representative of one or several learner populations and therefore tend to be quite large, that is, counted in millions rather than thousands of words. They are usually collected by academics or publishers, rather than teachers. The ICLE for L2 English and the ASK corpus (Tenfjord, Hagen, & Johansen, 2006) for L2 Norwegian are good examples of this type of corpus. Local learner corpora are collected as part of normal teaching activities, often by the teachers themselves, and may therefore be of a much more modest size. For example, the local corpus described by Mukherjee and Rohrbach (2006) has a total size of approximately 30,000 words. The compilation of local learner corpora is still the exception rather than the rule but is one of the most promising avenues in learner corpus research.

Cross-Sectional Versus Longitudinal

Learner corpora can sample language data from different learners at a single point in time, in which case we speak of a cross-sectional corpus, or track the same learners over a particular time period, in which case the term “longitudinal” (or “developmental”) is used. As truly longitudinal corpora are very difficult to collect, there are still very few of them and they constitute one of the major desiderata for future learner corpus research. In addition, many learner corpora which claim to be longitudinal in fact sample similar-type learners at different levels of proficiency and should therefore more appropriately be called “quasi-longitudinal.”

Spoken Versus Written

For a number of years written corpora dominated the learner corpus scene. This is now changing with oral corpora gaining ground, as evidenced by the release of the *Louvain Database of Spoken English Interlanguage* (Gilquin, De Cock, & Granger, 2010) which samples learners similar to those represented in the ICLE and will therefore allow for very useful speech-writing comparisons. The rapid integration of e-learning tools in language teaching is greatly facilitating data collection and has allowed the collection of language productions that display characteristics of both speech and writing, such as data arising from computer-mediated communication (Belz & Vyatkina, 2008).

Learner Corpus Methodology

Corpus Annotation and Exploration

Learner corpora can be used “as is”, that is, in their raw form, without any additional linguistic information inserted into the text files. However, for many types of investigation, it is useful to annotate the corpus linguistically. Part-of-speech (POS) tagging, which assigns to each word in a corpus a tag indicating its word-class membership, can be done fully automatically and with a high degree of accuracy, although the very nature of learner data calls for a degree of caution as errors may lead to tagging errors (Van Rooy & Schäfer, 2003). Another type of annotation that is particularly relevant for learner data is error annotation.

Unlike POS tagging, this process is not automatic, but it can be partially automated using specially designed editing software tools that facilitate the insertion of error tags into the text files. Computer-aided error analysis offers some advantages over traditional error analysis, such as the standardization of error categories employed. Once the error tags have been inserted, researchers can view them in context alongside correct occurrences and draw up comprehensive lists of errors of a particular type (Dagneaux, Denness, & Granger, 1998). Chuang and Nesi (2006) have used this approach to identify, catalog, and analyze formal errors produced by Chinese learners of English and design grammar exercises based on these insights.

As learner corpora are in electronic format, they can be explored automatically with a wide range of text retrieval software tools, which provide frequency information on words, phrases and, if the corpus has been POS-tagged, grammatical categories. SLA and FLT researchers are thereby given access to a wealth of quantitative information on learner language that was hitherto unavailable. Using the lexical software tool VocabProfile, Horst and Collins (2006) traced the lexical development of young ESL learners over time. Contrary to expectations, they did not identify increasing amounts of infrequent vocabulary. Instead, lexical development manifested itself in a greater variation of basic vocabulary and a wider range of inflectional and derived word forms. Other tools, such as WordSmith Tools (Scott, 1996), allow researchers to sort the data and discover the preferred lexical and grammatical company of words used by learners, in particular their use of collocations and recurrent phrases. De Cock's (2004, p. 243) study of recurrent combinations in native and learner speech shows that "learners are lacking in routinized ways of interacting and building rapport with their interlocutors and of toning down and weaving the right amount of imprecision and vagueness."

In keeping with corpus linguistic practices, researchers usually use aggregate data drawn from many learners and analyze them as wholes. This practice is not without problems, however, as learner language is characterized by a high degree of variability, and one or two individuals may use language in highly idiosyncratic ways and thereby skew the overall results. As pointed out by Durrant and Schmitt (2009, pp. 168–9), this problem can be solved by computing both group and individual scores.

Contrastive Methodology

One of the best ways of uncovering the features that are typical of learner language is to compare it to other samples of learner language or to a control corpus of expert production, or both, an approach that is referred to as "contrastive interlanguage analysis" (Granger, 1996).

Comparisons between learner varieties can help distinguish the features that are proper to learners from a specific mother tongue background from those that are found in several learner populations, irrespective of their mother tongue. They are therefore particularly useful when it comes to identifying transfer effects. To strengthen the transfer interpretation, researchers can combine learner corpus data with data from bilingual corpora of the learners' mother tongue and the target language (Gilquin, 2008). For example, Paquot (2010) establishes that French learners' overuse of imperative structures such as *let us turn out attention to*, *let us take the example of*, *let us be clear that* in academic writing is transfer-related on the basis of (a) the significantly lower use of these forms in the other nine learner populations investigated, and (b) the frequent use of the imperative as an organizational marker in French academic texts. Although comparisons in terms of learners' mother tongue backgrounds have been the most popular so far, inter-learner comparisons may involve all the variables that have been stored in the database, such as age, medium, timing, task type, or proficiency level. Ädel (2008), for example, compares the use of involvement

markers (use of first person singular pronouns or adverbs like *of course*) in timed versus untimed learner essays and finds that they are much more frequent in timed essays.

Target language comparisons, on the other hand, set learner corpus data against a control corpus of expert production, usually a native speaker corpus. This procedure helps to bring to light the words, phrases, grammatical items, and syntactic structures that are over- or underused by learners and which therefore contribute to the foreign-soundingness of perhaps otherwise error-free advanced interlanguage. As under- and overuse often go together with misuse, this type of comparison gives a different insight into learners' language use.

The use of a native speaker yardstick has been criticized by a number of SLA specialists on the grounds that it fails to recognize learner language as a variety in its own right and thus falls into the "comparative fallacy" trap. However, the method remains very popular among learner corpus researchers, who argue (a) that it is simply a method, which neither assumes nor precludes any theory of interlanguage; (b) that this method is effective in uncovering interlanguage features; and (c) that corpus-based target norms are both transparent and diverse, which contrasts favorably with the intuition-based norms implicit in many SLA studies (see Mukherjee, 2005; Tenfjord et al., 2006).

Learner Corpus Analysis

Unlike previous research which gave priority to the early stages of acquisition, learner corpus research has tended to focus on the later stages and has helped describe advanced interlanguage, a learner variety that had until recently been largely neglected. It has established that, beside grammar, which remains a problem even at an advanced level, the main problem areas are lexis, lexicogrammar, phraseology in the wide sense, discourse, and register. It has also shown that difficulties manifest themselves in patterns of over- and underuse, at times more than actual errors.

Many frequency differences have proved to be shared by learners from different mother tongue backgrounds: underuse of marked structures like the passive, overuse of some words and phrases, in particular those that have direct equivalents in the learner's mother tongue, underuse of academic words and phrases typical of argumentative writing, intrusion of speech-like features in formal writing, and so forth. Logical connectors are a good illustration of words that display these characteristics (see Granger & Tyson, 1996). Research has shown that at the more advanced proficiency levels, misuse has less to do with morphology than the appropriate use of words and structures in context. For example, Xiao's (2007) investigation of the passive shows that underuse is a much more frequent feature of Chinese learner writing than misformation errors. Many studies point to the major role played by transfer. In her study of verb + noun collocations in German learner writing, for example, Nesselhauf (2005) found that transfer from the learner's L1 was a likely factor in over half the erroneous collocations. Influence from the mother tongue is also strongly in evidence in Díez-Bedmar and Papp's (2008) study of article usage by Chinese and Spanish learners.

A highly promising strand of research comes from the field of psycholinguistics (Ellis, Simpson-Vlach, & Maynard, 2008). Combining corpus linguistic and psycholinguistic techniques (such as eye-tracking or dictation) has proved a powerful method for highlighting salience and frequency of the input as key determinants of language reception and production. Using the two types of data, Siyanova and Schmitt (2008), for example, found little difference between native and learner usage of appropriate collocations, but demonstrated learners' poorer intuitions regarding the frequency of collocations compared to native speakers.

Learner-Corpus-Based Applications

A wide range of applications can benefit from learner-corpus-based insights: from materials design and classroom methodology to natural language processing (NLP) applications which make use of advanced computational techniques.

Materials Design and Testing

Learner corpus insights can contribute to three key components of materials design: selection, presentation, and practice. In view of the restrictions in terms of page numbers, it is essential that the most useful language items be selected for inclusion in course materials and reference books. Learner corpus data are invaluable here as they provide ample evidence of learners' difficulties, not only of what learners get wrong, but also of what they fail to produce at any given proficiency level, and it makes a great deal of pedagogical sense to focus on these difficulties. Some of them are shared by a large number of learner populations and can be integrated into generic tools, while others are specific to one learner group and are ideally suited to informing L1-specific monolingual or bilingual materials. Once selected, items need to be described and here too learner corpus data can help, notably by giving adequate weight to the most difficult aspects of language and downplaying those that are already mastered.

Analyzing learner corpus data and integrating the results into pedagogical materials is an intensive process and it is therefore normal that there should not yet be many up-and-running applications. However, the few that do exist bear witness to the potential they hold for materials design. For example, Wible, Kuo, Chien, Liu, & Tsao (2001) describe a powerful Web-based system which allows for the generation, annotation, and pedagogical exploitation of learner corpora. The environment is extremely attractive both for learners, who get immediate feedback on their writing and have access to lists of errors they are prone to produce, and for teachers, who progressively build up a large database of learner data which they can draw on to develop targeted exercises. Chuang and Nesi (2006) have carried out a corpus-based error analysis of academic texts written by Chinese students studying in the medium of English and on that basis designed a remedial online self-study package called GrammarTalk which targets high-frequency errors such as article errors. Cowan's (2008) English grammar contains "Problems that EFL/ESL students have" sections which highlight errors extracted from learner corpora. The latest edition of the *Macmillan English Dictionary for Advanced Learners* contains approximately a hundred error notes based on authentic errors extracted from the ICLE and an extended "Improve your writing" section based on the analysis of both native and learner corpus data (Gilquin, Granger, & Paquot, 2007).

Testing is another field that stands to gain. Carefully analyzed, learner corpora can help practitioners select and rank testing material at a particular proficiency level. Using a learner corpus made up of candidate scripts from three Cambridge ESOL examination levels, Hawkey and Barker (2004) have identified key language features distinguishing performance in writing at four pre-assessed proficiency levels, and suggest how these features might be incorporated in a common scale for writing.

Classroom Methodology

Learner corpus data are a good resource for form-focused instruction and data-driven learning (DDL). As illustrated in Granger and Tribble (1998), exercises making use of native and non-native concordances of problematic words and phrases can help learners notice the gap between their own and target language forms. This method is particularly well suited for fossilized language use and is likely to be especially motivating in the case of

local learner corpora, where learners are at the same time the producers and users of the language, as the forms they focus on are of direct relevance to them. Hegelheimer and Fisher (2006) describe the iWRITE Web interface which allows learners to access error-tagged learner essays. The system is meant to help learners prepare for editing or peer editing and more generally aims to help raise learners' awareness and encourage autonomy. Belz and Vyatkina (2008) show how a developmental learner corpus of computer-mediated communication can be used dynamically to track learner changes over time and produce corpus-driven teaching materials that address specific interlanguage features.

NLP Applications

Combined with NLP techniques, learner corpora—especially those that are annotated for errors—can be used to draw up automatic profiles of learner proficiency (Meurers, 2009). Based on these learner models, automatic error diagnosis and feedback generation modules can be designed and integrated into intelligent CALL (ICALL) programs. One particularly successful example is the E-Tutor (Heift, 2010), an ICALL system for L2 learners of German, which makes use of a learner corpus collected from approximately 5,000 students for feedback generation and language exploration. Another field which can benefit from the combined use of learner corpus data and NLP techniques is the automatic rating of essays (Dikli, 2006). Research shows, however, that the integration of these sophisticated NLP-based systems into reliable pedagogical tools poses a tremendous challenge: correct words or phrases may be diagnosed as incorrect (overflagging) and incorrect instances may be missed (low recall value). For example, while Tetreault and Chodorow's (2008) preposition error detection module achieves excellent precision (about 80%), it has very disappointing recall (about 10%), which restricts its pedagogical integration to highly constrained environments. In spite of these difficulties which reflect the complexity of modeling learner language, concrete achievements like Heift's show that NLP developments are among the promising applications of learner corpus research.

Language for Specific Purposes Learner Corpora

SYLVIANE GRANGER AND MAGALI PAQUOT

Learner corpora are electronic collections of (near-)natural foreign or second-language-learner (L2) language assembled according to explicit design criteria (Granger, 2008). So far, they have predominantly been collected in the context of foreign/second language courses for general purposes (e.g., the International Corpus of Learner English; <http://www.uclouvain.be/en-258641.html>). A very promising but as yet less widespread data type is the language for specific purposes (LSP) learner corpus, which contains discipline and genre-specific texts written by learners within the framework of LSP or content courses. These texts are exemplars of the different genres (e.g., papers, lab reports, case studies, project reports, or letters) that are most typical of specific disciplinary communities (e.g., physics, linguistics, history, engineering, medicine, or business). The aim of LSP learner corpus research is to uncover L2 learners' difficulties in these specific domains and to design tailor-made learning and teaching methods and tools. This type of corpus has connections with English as a lingua franca (ELF) corpora but differs from them in that the subjects are language learners of varying degrees of proficiency in educational settings, while the ELF subjects are characterized primarily as users of the language involved in real-life communication events. It also has similarities with corpora of proficient student writing such as the Michigan Corpus of Upper-Level Student Papers (MICUSP; <http://micusp.elicorpora.info/>) or the British Academic Written English Corpus (BAWE; <http://www2.warwick.ac.uk/fac/soc/al/research/collect/bawe/>), which contain data from native and international students in mixed naturalistic and instructional environments.

In view of the status of English as the dominant language for knowledge dissemination and international communication, LSP learner corpus research has mainly centred on *English* for specific purposes (ESP), with a large number of ESP learner corpus compilations, especially in Asia. In spite of this vitality, it is not easy to survey the field as research is scattered and tends to be rather confidential, a situation recognized by Alsop and Nesi (2009, p. 75), who state that discipline-specific student writing "has tended to be collected for individual scholarly purposes rather than as part of formal corpus-building projects." They tend to be "small private collections of student assignments" (Alsop & Nesi, 2009) that are not widely available. One of the consequences of the localized nature of LSP learner corpora is that they are usually L1-specific, that is, they contain data from learners sharing a single mother-tongue background (e.g., Chinese for Lee & Chen, 2009). A few ESP learner corpora include texts produced by international students from several mother-tongue backgrounds collected in a specific institution, but as the samples are aggregated it is not possible to search the L1 populations (e.g., Hewings & Hewings, 2002). A notable exception is the Indiana Business Learner Corpus (http://www.liberalarts.iupui.edu/icic/research/indianapolis_business_learner_corpus) which is made up of application letters from native and non-native speakers of English studying in three different undergraduate business classes in Belgium, Finland, and the US (Connor, Pretch, & Upton, 2002).

There is clear scope for the collection and dissemination of multi-L1, multidiscipline, and multigenre corpora of LSP learner language. A step in this direction is the Varieties

of English for Specific Purposes dAtabase (VESPA; <http://www.uclouvain.be/en-cecl-vespa.html>) learner corpus which contains ESP texts produced by English-as-a-foreign-language (EFL) writers from various mother-tongue backgrounds in a wide range of disciplines (linguistics, business, engineering, experimental sciences, environmental science, etc.), genres (research papers, project reports, MA dissertations) and degrees of writer expertise in academic settings (from first-year students to PhD students). The database is searchable via a range of variables relating to learner (e.g., age, gender, educational background, country) and task (e.g., genre, type of reference tools used). Two online LSP learner corpora are also worth mentioning here: the Learner Corpus of Essays and Reports (<http://langbank.engl.polyu.edu.hk/engine.aspx?Submit=Search&lang=1&corpus=16>) and the Learner Corpus of English for Business Communication (<http://langbank.engl.polyu.edu.hk/engine.aspx?Submit=Search&lang=1&corpus=15>). These two corpora are searchable online via the PolyU Language Bank platform (<http://langbank.engl.polyu.edu.hk/indexl.html>), but their usefulness for research is somewhat limited by the fact that they do not allow for genre- or discipline-specific searches.

Another type of corpus relevant for LSP research is the translation learner corpus, which contains translations that have been produced by trainee translators. While translation learner corpora such as the Student Translation Archive (Bowker, 2002) and the MeLLANGE Learner Translator Corpus (Castagnoli, Ciobanu, Kunz, Kübler, & Volanschi, in press; <http://corpus.leeds.ac.uk/mellange/ltc.html>) mainly consist of translations into the first language, the PELCRA learner translation corpus (Uzar & Waliński, 2001; <http://pelcra.ia.uni.lodz.pl/>) also includes trainee translations from Polish to L2 English.

Unsurprisingly perhaps, there are many more written than spoken LSP learner corpora. The potential of the latter is, however, demonstrated by the International Teaching Assistants corpus (ITAcorp), which contains samples of the language production of international graduate students in ITA language classes as they engage in a number of role-play situations designed to mirror university instructional contexts, such as “office hour” role-plays (practicing receiving students during non-teaching office hours), brief lecture presentations, and leading a discussion (Thorne, Reinhardt, & Golombek, 2008). The ITAcorp was built to identify aspects of teachers’ professional discourse that are problematic for ITAs, and to help them negotiate the many spoken genres that are typical of instructional activity. The design of spoken and multimodal LSP corpora is clearly one of the key desiderata for the future.

Many studies of LSP learner corpora rely on quantitative and qualitative comparisons of learner and expert language to uncover the distinctive features of learner language. For example, Flowerdew (1998) compared the use of cause and effect markers in a corpus of 80 student assignments which discussed various environmental problems and an expert corpus of edited papers, *Global Warming: The Greenpeace Report*. Among other things, she found that prepositions were commonly used to mark causality in the expert corpus, but occurred far less frequently in the learner corpus; and that, unlike expert writers, Hong Kong EFL learners rarely used modifiers with causative verbs and complex prepositions to attenuate the proposition. Comparisons of learner and native or expert language constitute one branch of contrastive interlanguage analysis (CIA) (Granger, 2008), a methodology that has been widely used to analyze learner corpora (e.g., Nesselhauf, 2005; Paquot, 2010). The other branch of CIA, which consists in comparing different varieties of interlanguage, has been less popular in LSP learner corpus research and has tended to focus on cross-discipline rather than cross-L1 comparisons (see Upton & Connor, 2001 and Connor, Pretch, & Upton, 2002 for exceptions). Hyland (2004), for example, compared the use of meta-discourse markers in dissertations by L2 postgraduate writers in six academic disciplines (electronic engineering, computer science, business studies, biology, applied linguistics, and public administration) and found substantial variations in the ways L2 writers present

their research and engage with their readers across disciplinary communities. Hyland interpreted these differences in terms of the norms and expectations of particular cultural and professional communities and showed, for example, that the high density of citations found in biology dissertations is also a feature of research articles in biology. Cross-L1 comparisons, however, constitute a major avenue for future research as they make it possible to distinguish the difficulties that are specific to one L1 population from those that are shared across a range of L1 backgrounds.

The linguistic analysis of LSP learner corpora relies on genre analysis and/or discourse analysis, often used in combination with corpus-linguistic techniques. Upton and Connor (2001), for example, have adopted the Swalesian tradition of genre (Swales, 1990) and combined it with a computerized analysis of lexicogrammatical features of texts to analyze politeness strategies in application letters written by Belgian, Finnish, and American students. They carried out a hand-tagged moves analysis, classified segments of text according to their communicative purpose, and examined the linguistic features related to the concept of politeness (e.g., modals and formulaic expressions). Differences in the use of politeness strategies across countries were partly attributed to differences in audience expectations and writer concepts of how politeness is expressed. Other researchers have adopted a more discourse-related or functional perspective. Hewings and Hewings (2002) compared the use of clauses with an anticipatory *it* and extraposed subject in an expert corpus of research articles and a corpus of dissertations written by non-native speakers as the last component of their MBA programmes. Student writers appeared to use more *it*-clause emphatics and attitude markers to persuade readers of the validity of claims. Similarly, Flowerdew (2008) investigated the lexicogrammatical patterning of key words for the problem–solution pattern in a corpus of group project reports written by EFL undergraduate science and engineering students on a technical communication skills course in the language centre at the Hong Kong University of Science and Technology. She found that students used a very narrow range of verbs as well as register-inappropriate verbs (e.g., *get rid of*) and confused cause/effect verbs with result/effect verbs. She attributed these difficulties to “the lack of an appropriate grammar system and vocabulary range which play a role in the co-construction of meaning through the blending of collocational and colligational features of language” (Flowerdew, 2008, p. 133) in academic discourse. The influence of a Sinclairian approach to corpus-driven lexicogrammatical patterns (Sinclair, 2004) is apparent in a large number of studies. Lee and Chen (2009), for example, relied on corpus linguistic tools and techniques to identify keywords in the Chinese Academic Written English (CAWE) corpus, a corpus of dissertations written by Chinese undergraduates majoring in English linguistics or applied linguistics. The keyword analysis made it possible to identify salient features in the Chinese learner corpus—the high frequency of the verb *make* and the function words *can*, *besides*, and *according to*—which were then submitted to a careful lexicogrammatical analysis. The high frequency of the modal *can*, for example, appeared to be largely due to Chinese learners’ use of phrases such as *we can see*, *we can observe*, and *we can find* to refer to tables and figures, a pattern that is quite rare in expert and native student writing corpora where phrases such as “*Table 4 displays*,” “*are illustrated in Figure 1*,” or “*as shown in Table 2*” are preferred. A similar approach, adopted by Gilquin, Granger, and Paquot (2007), helped to uncover a wide variety of lexicogrammatical difficulties in English for academic purposes (EAP) writing, some proper to foreign-language learners, others shared by novice native writers.

Although research in the field is both active and varied, it has not yet resulted in off-the-shelf LSP learner-corpus-informed pedagogical materials. This should not be taken to mean that the research has remained purely theoretical or descriptive. As Thompson (2006, p. 7) aptly reminds us, “A feature of ESP work is that the needs of learners are often highly specific and teachers may have to develop materials and resources for the specific

context.” In many cases, the LSP learner corpus analyst is also the corpus compiler, a situation which offers the significant advantage of enabling the teacher to authenticate the data for classroom use to fit the students’ reality (Flowerdew, 2008, p. 134). Hewings (2000) illustrates how teachers can use learner texts collected in their ESP courses to identify common areas of difficulty for a particular group of students, and to inform classroom practice. In the same vein, Lee and Swales (2006) report on an experimental corpus-based course for international doctoral students in which they made students compile corpora of their own writing for comparison with expert writing in the discipline. For less localized pedagogical resources, the future clearly lies in electronic resources which can be customized to learners’ L1s and disciplines. The Louvain EAP dictionary-cum-writing aid, a Web-based tool, demonstrates how insights gained from the analysis of both learner and expert corpora can help L2 writers from several L1s express key academic functions such as contrasting, introducing a topic, quoting, and so forth, in a range of disciplines (Granger & Paquot, 2010).

Learner Modeling in Intelligent Computer-Assisted Language Learning

MATHIAS SCHULZE

In computer-assisted language learning (CALL), a student model is a computational data structure that contains information about individual students and thus facilitates individualized instruction through the adaptation of a language learning system to the learner. Intelligent tutoring systems in general are said to consist of three parts: an expert model which contains the knowledge of the domain, a teacher model which determines the system's instructional content and sequence, and a student model which stores information about the learners' behavior and draws inferences about their knowledge and beliefs. Despite the need for individualized learning environments, student modeling has not been a strong focus of CALL because its development and implementation are nontrivial, time-consuming, and labor-intensive (McCalla, 1992) and because the challenging task of representing the domain knowledge of language and language learning is still largely incomplete (Levin & Evans, 1995).

Of course, CALL design considers the (individual) learner, but most systems make use of an implicit student model (McCalla, 1992), which is static, in the sense that the student model is reflected in the design decisions inherent in the system and derived from a designer's point of view. In tutorial CALL in general, assumptions about students' behavior, knowledge, and beliefs are modeled indirectly in the activity design. In intelligent CALL (Heift & Schulze, 2007), for example, implicit student models can consist of (grammatical) parser rules which describe aspects of the students' interlanguage which are not part of the L2 rules, or rules which are part of the learners' L1 system; thus the system's view of the learner cannot and does not change in the learner's interaction with the system. An explicit model, on the other hand, is dynamic in that it is used to drive instructional decisions and is thus not part of the instructional design structure as such (see, e.g., Amaral & Meurers, 2008). Student models can be used in a number of ways (Elsom-Cook, 1993): corrective (providing tailored feedback), elaborative (extending the knowledge of the student), strategic (guiding decisions on teaching interventions), diagnostic (to determine the knowledge state of the student), predictive (anticipating future student behavior) and evaluative (assessing the level of student achievement).

Explicit student models can be open (Mabbott & Bull, 2004), that is, the information recorded and inferred about an individual student is made available to that student. Here it is important to construct student models that can be studied and understood by the learner because this student-model interaction supports reflection, negotiated assessment, and knowledge awareness. Open learner models need to meet the following criteria (Dimitrova, Brna, & Self, 2002):

- Understandability: Dimitrova et al. (2002) argue for a representation using conceptual graphs. These are semantic networks with constraints attached to their nodes and links.
- Effective inspection: This means that the inspection of a learner model should provoke inferential processes and metacognition.
- Reduction of cognitive load: This is important because this load is generally very high during inspections. This supports the need for a graphical representation of the

information contained in the student model. Dimitrova et al. (2002) showed in their study that after little initial training with conceptual graphs students appreciated the graphical knowledge representation.

- Expressiveness: This means that both the system and the learner need to be able to express their view of the model in a dialogue.
- Effective communication: This criterion builds on expressiveness and stipulates a scenario in which both the system and the learner need to be able to understand expressions constructed by the other party.
- Symmetry: This states that learner and system maintain the student model jointly.

An open student model is either inspectable, and provides some view of the system's information structure to the student, or collaborative, and additionally allows some scope for students to change their individual learner model. The latter approach results in a more accurate model despite the fact that students do not always report their own knowledge states accurately. A collaborative model records, for example, the past and current learning stages by recording the level of rule mastering by a particular student and by indicating "the learner's own assessment of his ability" (Bull, Pain, & Brna, 1993, p. 49).

All student models have in common that they gather and structure information about the student's knowledge. "But we cannot directly observe what a student does and does not *know*; this we must infer, imperfectly, from what a student does and does not *do*" (Mislevy & Gitomer, 1996, p. 253). Simpler models such as the activity logs of most virtual learning environments only maintain some historical data of the user (scores, task completion, utterances produced, etc.). In this case the model is frequently described as a student profile or student (activity) log. Such an obtaining of information about the surface of students' learning processes on the computer is called tracking (e.g., Hwu, 2003). Even the mere compilation of a student profile through tracking has a number of advantages: automatic collection of research data, testing of a teaching methodology, provision of feedback on the quality of the courseware, and facilitation of real-time tailoring of the courseware to the user. The information recorded could range from a simple count of how many incorrect answers have been given to complex data structures which purport to represent a relevant part of the student's knowledge of the subject. For a more complex model, the system needs to infer a more elaborate knowledge state or student beliefs. This data interpretation can be problematic because a student profile may contain contradictory information that first has to be analyzed and interpreted. Thus, we can distinguish a surface-level student model which "represents the scheduled problem solving plans and applied procedural knowledge" from a deeper-level student model which "must infer and model the student's belief by interpreting the surface level student model" (Villano, 1992, p. 469).

Ohlsson (1992) identifies five different approaches to creating and maintaining a student model: the bug library technique, the machine learning approach, the model tracing technique, constraint-based student modeling, and probabilistic modeling. Of these, only the bug library technique, the model tracing technique, and constraint-based modeling have been applied to CALL (Schulze, 2008).

The bug library technique comprises error descriptions of student errors and their explanations. These models are either runnable (student knowledge as a subset of expert system rules plus some buggy rules) or are overlay models (assigning competency or probability to different rules according to inferences the system has made). The error libraries are also restricted in that they are not transferable from one student population to another.

The model tracing technique (e.g., Tasso, Fum, & Giangrandi, 1992) monitors each step the student takes in the problem-solving process instead of attempting to infer knowledge states from final answers. "The student is modeled as the set of rules which matched his

or her steps in the traced performance" (Ohlsson, 1992, p. 433). Accordingly, the actual student performance is compared to the expected student behavior as predicted by the learner model. If the system is intended to model the different steps students take when learning grammatical knowledge items, model tracing appears to be a viable option, whereas if the CALL system is used in communicative language teaching, it is not necessarily possible to establish and trace an ordered sequence of deterministic steps the learner took or will have to take.

The constraint-based approach presupposes that diagnostic information is not attained from the (intractable) learning process the student undergoes. Instead it is obtained from the problem state at which the student arrives—the final result. The constraint-based approach has similarities to the bug library technique described above. Both start with a knowledge base in the expert system. The bug library technique generates possible deviant solutions with meta-rules that transform rules and facts from the expert system. The constraint-based approach relaxes these constraints during the analysis in order to determine the rule(s) that might have been violated. Each constraint consists of a relevance condition that, in turn, determines when to apply the satisfaction condition (Ohlsson, 1992). The constraint-based modeling approach is very efficient because it does not rely on the anticipation of student errors as an intractable problem (Heift, 2008), but it poses different problems because it has to work with an immensely large search space and many (often spurious) parses of one utterance are generated (Vandeventer, 2001). Parsers produce a variety of parse trees for a single sentence, in particular for one that contains errors. As a result, it is still problematic to update the student model with the most appropriate parsing result. One possibility is to augment the parse results with information about typical student behavior and likely acquisition orders. "With this information, we will be able to build links in the inference network that will enable SLALOM [Steps of Language Acquisition in a Layered Organization Model] to provide data on structures previously unseen in user's language production" (Michaud & McCoy, 2004, p. 346). However, acquisition order is only one, not even very reliable filter criterion when it comes to determining the best of many analyses of student input. Other contextual variables (e.g., task, linguistic context) will also have to be considered. When the most appropriate (part of a) parse is selected for feedback provision, multiple errors will have to be reported to the student in an order of linguistic and pedagogic importance.

The different approaches to learner modeling all need to begin with an initialization of the learner model, which can be achieved in four different ways. In the first approach, the system assumes that the student has no prior knowledge about the domain. Alternatively, the student is placed in the middle of the ability range, in particular for the purposes of diagnostic adaptive testing. Both assumptions, however, are arbitrary. In the second approach, the system administers a pretest that is used to determine the current student's knowledge state. Third, it is also possible to take a pattern from models of similar students as a stereotype. In the final approach, the system uses "artificial" students, that is, vague models of students, to produce behavioral patterns that form the data for the learner model. The lack of system knowledge of the new user is often compounded by the fact that beginning users produce less elaborate input and more errors (e.g., Michaud & McCoy, 2004).

Generally, student models are more complex than other user models because misconceptions and inconsistencies in the student's knowledge have to be considered. Most learner models capture the knowledge state(s) of the student relative to the domain of learning. Individual learner differences are incorporated in far fewer models (for an exception see Bull, 1994), but these need to be considered, recorded, and inferred if a student model is to support individualized language instruction. Learner models are always approximations because student behavior is inconsistent, language learning is dynamic, non-monotonic, nonlinear, and complex, and possible explanations for the observed behavior are ambiguous.

Students are often unable to consider all relevant issues simultaneously when solving a problem because nobody has full access to their full body of knowledge at all times, they try out new hypotheses, and they react adversely to external pressures.

Student models need to be evaluated empirically. Chin (2001) proposes the use of available measurement tests in order to obtain data on (personal) covariate variables such as aptitude and learning styles, and lists ethnographic field studies, content analysis, case studies, self-reports, and interviews as possible qualitative approaches. User models, in general, have a strong ethical dimension because they store and rely on personal information on human subjects. Here issues of storing data about users securely and preventing misuse by third parties are highly relevant (Schreck, 2003).

Learner Readiness

PATSY MARTIN LIGHTBOWN

Readiness is a concept that is relevant to all aspects of learning and development. It may be understood in a general way as openness to learning or *motivation*, along the lines of “you can lead a horse to water but you can’t make it drink.” From the perspective of biological development and in the context of language acquisition, readiness is tied less to motivation than to *capacity*, along the lines of “you have to crawl before you can walk.”

Second language acquisition researchers have observed that learners tend to proceed through “stages” or “developmental sequences” in that certain language behaviors seem to emerge only after other specific behaviors have occurred. This has led to the question of whether the syllabus or teaching materials should target what learners are *ready* to learn. Experimental studies have sought to answer three main questions: Does instruction alter the order of acquisition of language features? Is instruction more effective when it matches a learner’s stage of developmental readiness? Does instruction that targets language features or patterns that are beyond the learner’s current stage facilitate development? The studies show that the order of acquisition of features is not substantially altered by instruction. Results also suggest that instruction facilitates both the rate of acquisition and progress to more advanced stages, whether or not the instruction specifically focuses on the features learners are “ready” to learn.

Developmental Sequences in Language Acquisition

Research on developmental sequences in second language acquisition grew out of research in child language. In both longitudinal (Brown, 1973) and cross-sectional (de Villiers & de Villiers, 1973) studies, patterns of similarity were observed in the order in which young children began to use certain English morphological features. For example, they reliably used regular plurals (*cats, dogs*) before they acquired possessives (*the cat’s milk, the dog’s tail*), and they used progressive -ing endings (*mommy jumping!*) before simple present third person singular (*Daddy likes milk*) endings.

Developmental sequences in the second language acquisition of some of these same features were described by Dulay and Burt (1974) and Krashen (1977) in studies of learners who had different first languages. The developmental sequences that they described were based on the *relative accuracy* with which learners produced different morphemes. Thus, for example, a learner who used plural -s in 60% of obligatory contexts and possessive -’s in 40% of obligatory contexts was deemed to have acquired plural before possessive. Krashen (1982) based his *natural order hypothesis* on these findings.

In the 1980s, researchers in the ZISA (Zweitspracherwerb italienischer, portugiesischer und spanischer Arbeiter) project found strong similarities in the path that untutored learners took in the acquisition of the complex word order rules of German (Meisel, Clahsen, & Pienemann, 1981). For example, learners first used basic subject–verb–object (SVO) word order, only later exhibiting an ability to use German’s “verb second” rule, and still later acquiring the rules for subordination that require the finite verb to move to the end of dependent clauses. However, they noted that *accuracy* in language production did not

correspond to developmental sequences and that it could be affected by a number of different factors. They argued that, rather than being tied to relative *accuracy* in obligatory contexts, acquisition might better be characterized in terms of the *emergence* of a feature in a learner's language. Taking into account that a single instance of a new feature might simply reflect a memorized chunk of speech rather than a pattern based on a learner's ability to manipulate linguistic elements, the ZISA researchers set a minimum number of occurrences of a feature before it was deemed to have emerged. However, once a small number of novel utterances containing the feature had occurred, the learner was said to have acquired that feature.

Other researchers have described developmental sequences in the second language acquisition of language features including questions, negation, tense and aspect markers, possessive determiners, and relative clauses. For example, in English as a second language (ESL), Pienemann, Johnston, and Brindley (1988) found a pattern in the development of the word order in questions. Like young first language learners, second language learners of English at the earliest developmental stage produce some questions that are grammatically correct because they have been learned as formulas (e.g., "What's that?" "What's your name?"). In forming other questions, however, they use SVO order, adding rising intonation to indicate a yes/no question. Later, they use a "fronting" pattern, placing an all-purpose question marker at the beginning of a sentence (e.g., "Do you can see it?"). Similarly, in information questions, learners place a "wh" word at the beginning, leaving the declarative word order intact (e.g., "Why you don't drink coffee?"). Only later are they able to perform the inversion of subject and auxiliary verb that characterizes English questions. This pattern has been observed even when the learners' first language has inversion in questions (Wode, 1978; Spada & Lightbown, 1999).

Although similarities in developmental sequences have been attested among learners from different first language backgrounds, there is also evidence of first language influence, for example in the extent to which learners seem to linger at a development stage in which a syntactic pattern in their interlanguage is similar to one in the L1 (Wode, 1978; Zobl, 1980).

Readiness and Instruction
